Aging, Migration, Life satisfaction

Abstract

Aging is a natural, universal and inevitable with the passage of time. It is a continuous process in end of our life. Old age is the end stage in the life journey and closing period in the life span of a man with decreased capacity for adaptation. The aged are otherwise known as elderly, senior citizen "Geriatric age group" and second childhood. The field of study was dealt with aging and the special problems of the elderly parents of migrant workers. The population of the older persons in India is continuously increasing due to the advancement in medical science, improvement in living conditions and public health facilities have prevented epidemics and brought the general diseases under control. This has increased the life expectancy. So, the children should extend their support. But due to urbanization, occupation the children are migrated from their own places. The parents are underwent many problems like, physical, psychological. The elderly persons need care and support of the family members. The main objectives of this study were psychological problems of the respondents and level of life satisfaction.

Introduction:-

The term gerontology comes from the Greek word *geras* meaning 'old age' and *logos* referring to the study of a subject. The term, gerontology is very broad and encompasses the psychological, socio economic and physiological aspects of old age. Social gerontology is concerned with reciprocal relationship between the individual and society. The term geriatrics deals with causes and amelioration of physical pathology in old age. Senescence, a biological term refers to government that is ruled by elders. Ageism is discrimination against individual on basis of old age. The term geronto phobia is used to designate the fear of growing old or the fear of hatred of the aged. The term ageing refers to the process of growing old.

India has around 100 million elderly at present and the number is expected to increase to 323 million, constituting 20 per cent of the total population, by 2050.

Review of Literature:-

Daniel Doyle and Marilyn J. Forehand (2014) made a study on Life Satisfaction and Old Age a Re examination. Using data from a large, representative national sample, this article replicates some earlier analyses regarding life satisfaction and old age. Persons over age 65 were found to be only slightly less satisfied with their lives than persons aged 40 to 54 and 55 to 64. Poor health, loneliness, and money problems are the strongest correlates of life

satisfaction across age groups. The small negative correlation between age and satisfaction is largely eliminated when controls for these three factors are imposed. A regression analysis is used to determine the relative strength of a number of possible predictors of life satisfaction within different age groups.

Prakash I.J., (2003) conducted a study on Aging, disability, and disabled older people in India. India is witnessing a demographic revolution, leading to a considerable increase in the proportion of older people in the population. Similarly, life expectancy of both the mentally and physically disabled has improved considerably. About 5% of Indian older people have problems with physical mobility. Aging has become a gender issue in India not only because more women are surviving into old age; they are also vulnerable and disadvantaged in many ways. In most cases they are the only caregivers available for the old and disabled. Older Indians are considered a high-risk group for multiple morbidity. It is estimated that nearly four million Indians suffer from mental problems. India has around 12 million people designated as "handicapped." However, little information is available about disabled people who grow older. The National Policy on Older Persons, which has been recently formulated, aims at providing an improved quality of life for millions of older Indians. However, the concerns of older disabled and of the disabled who grow old are still treated separately in both policy and practice.

Kalavathy M.C., Thankappan K.R., Sankara sarma P., Vasan R.S. (2000) made a study on prevalence, awareness, treatment and control of hypertension in an elderly community-based sample in Kerala, India. Hypertension is one of the most important causes of cardiovascular morbidity and mortality in the elderly. With the increase in the number of elderly in India, hypertension is likely to emerge as an important public health problem. The study was performed a cross-sectional survey of a random sample of 357 community-dwelling elderly individuals (191 women, 166 men; mean age 70 years) in Kerala. We measured blood pressure on all study participants using a standardized technique to assess the prevalence of hypertension. We compared the variations in prevalence, awareness, treatment and control of hypertension according to age, sex and place of residence of the subjects, and examined the socio-demographic correlates of hypertension using specific multiple logistic regression.

The overall prevalence of hypertension sample was 51.8% (95% CI; 46% - 56.8%), Which did not vary with sex but increased with age. Fewer than half of the hypertensive subjects were aware of their condition or were on treatment, and only a quarter of the treated hypertensive achieved adequate control of blood pressure. Rural elderly subjects were especially less likely to be aware of, and on treatment for hypertension. Smoking status and rural residence (in men) and marital status (in women) were important correlates of hypertension. The study findings emphasize the public health importance of hypertension in the elderly in Kerala at present, and point to a likely increase in burden of this problem in India in the near future. A National Hypertension Programme, targeted to meet the imminent public health challenge posed by hypertension seems warranted.

Material and Methods:-

Objectives:-

- To study the psychological problems of the respondents.
- To study the level of life satisfaction among the respondents.

Hypotheses:-

- There is significant difference between living arrangement of the respondents and health problem.
- There is significant difference between loneliness of the respondents and their satisfaction in life
- There is significant difference between economic status of the respondents and their standard of living.

Research Design:-

The researcher has used descriptive research design.

Universe

The universe of the study was Labbaikudikadu town panchayat, Perambalur district.

Sample Size:-

The researcher adopted simple random sampling to select the elderly people in Labbaikudikadu town panchayat, Perambalur district. So the sample was 800.

Tool for data collection:-

A self prepared Interview Schedule was used to collect primary data from the respondents.

Hypotheses Test:-

- There is significant difference between living arrangement of the respondents and health problem.

DIFFERENCE BETWEEN LIVING ALONE AND HEALTH PROBLEM

S. No	Living arrangement of the Respondents	Mean	S.D	Statistical inference
1	Yes (n 706)	2.46	1.738	T= 6.07 0.00<0.05 Significant
2	No (n 94)	1.35	.936	

Findings:

It is evident from the above table that there is significant difference between living alone and health problem. Hence, the calculated value Less than the table (0.00<.05).

2. There is significant difference between loneliness of the respondents and their satisfaction in life.

DIFFERENCE BETWEEN LONELINESS AND SATISFACTION IN LIFE

S.No	Loneliness of the Respondents	Mean	S.D	Statistical inference
1	Yes (n 706)	1.46	.499	T= -.141 0.79>0.05 Not Significant
2	No (n 94)	1.47	.502	

Findings:

It is evident from the above table that there is significant difference between living alone and satisfaction in life. Hence, the calculated value Less than the table (0.79>0.05).

3. There is significant difference between economic status of the respondents and their standard of living.

DIFFERENCE BETWEEN ECONOMIC STATUS AND STANDARD OF LIVING

S. No	Economic status of the Respondents	Mean	S.D	Statistical inference
1	Yes (413)	10998.84	10319.912	T= -1.34 0.003<0.05 Significant
2	No (369)	12065.04	12245.889	

Findings:

It is evident from the above table that there is significant difference between Economic status of the respondents and standard of living. Hence, the calculated value Less than the table (0.003<.05).

Conclusion:-

Proper planning for old age is very essential in order to make fuller, happier, richer and graceful aging. Today old age does not necessarily spell death, disease and despair, if one plans ahead for old age. Make efforts to get a steady income during old age. The elderly have been traditionally well-respected and well cared for in Indian culture; experts predict that younger generations in the future are less likely to be concerned and involved in the health care of their older relatives due to urbanization, industrialization or migration not giving much importance to the elderly people. They should consider like child and take care of them. Parents play the vital role to seed the value the next generation to give respect, care and support during the old age period.

Heavy metals, Bio sorption, Tea waste,
Textile Industrial waste water.

Abstract

Wastewater contamination is an ever increasing problem which the whole world is facing now. Industrialization & globalization has led to the tremendous increase in use of heavy metals over the past decades. This has gradually resulted in increased flux of metallic wastes in marine, ground, industrial & even treated waste waters. As far as the modern treatment processes are concerned, removal of heavy metals are very expensive, require high energy and generate toxic sludge which pose serious threat to the whole ecosystem. Nowadays, the uses of natural, low cost & effective adsorbents are being highly recommended. As well as the method of bio sorption can help in removing heavy metals to a greater extent. For this project, agricultural waste i.e. Tea waste is used as bio sorbent for the removal of heavy metal like, chromium, cadmium & lead. With this new combination, it is possible to produce pollutant-free water & pollution-free ecosystem thereby reducing metallic pollution at low cost, simple, efficient & by natural means. In the present study, heavy metal contamination in textile industrial waste water has been discussed. The conventional methods of treatment are very costly, energy intensive and generate toxic sludge. Thus, the bio-sorption has been investigated as cost effective method for removal of heavy metals. The study involves the examination of experimental conditions such as pH of the solution, concentration of the solution, contact time and adsorbent loading on the removal of heavy metals from textile industry. Finally, the maximum adsorption of 96% is achieved by adding **1.0 g** of tea waste per 100 ml of wastewater.

Introduction:-

Water pollution is a major problem in the global context. Several industrial wastewater streams may contain heavy metals such as Cr, Cu, Pb, Zn, Ni, etc. including the waste liquids generated by metal finishing or the mineral processing industries. The toxic metals, probably existing in high concentrations, must be effectively treated/removed from the wastewaters. If the wastewaters were discharged directly into natural waters, it will constitute a great risk for the aquatic ecosystem. In recent years, the removal of toxic heavy metal ions from sewage, industrial and mining waste effluents has been widely studied. Among the many methods available to reduce heavy metal concentration from wastewater, the most common ones are chemical precipitation, ion-exchange, adsorption and reverse osmosis (Chao *et al.*, 2005). Heavy metals are the non-degradable, toxic and possess high density. Some of

the heavy metals are lead, cadmium, mercury, arsenic, chromium and thallium. Heavy metals are major pollutants and dangerous in marine, ground, industrial and even treated wastewaters because they tend to bio-accumulate. Bioaccumulation means an increase in the concentration of a chemical in a biological organism over time, compared to the chemical's concentration in the environment. The purpose of this research is to improve the method to remove high concentration of heavy metals from industrial wastewater. It is important to ensure there are no harmful heavy metals in the water stream because it can accumulate in the environment elements such as food chain and pose a significant danger to human health. The method of bio sorption offers many potential advantage in energy saving, process enhancement and processing time to remove heavy metal. In this research, tea waste was used as an adsorbent to assist bio sorption process because of its low cost, availability and its efficiency to remove heavy metal. Bio sorption is the best purification and separation techniques of heavy metals from waste water but in industries cost is very important parameter in comparison to the efficiency of adsorbent materials from waste water.

Research objective:-

The purpose of this research is to harness the potentials of tea waste by converting it to adsorbent used for adsorption of heavy metals like lead, chromium and cadmium from the textile industrial waste water collected from textile industry. To efficiently remove the metal contaminants and reuse the treated water for various agricultural and domestic purposes. To study the physio-chemical characteristics, analyze the toxicity range and their effects in environment of textile industrial waste water. To stress the advantages of bio sorption method & removal efficiency of heavy metals.

Scope of research:-

- 1) To improve current research by increasing the percentage of heavy metal removal from wastewater using tea waste as adsorbent.
- 2) To prevent the heavy metal concentration release to the water stream, reduce the cost & open up opportunities to increase the demand on wastewater treatment by using natural absorbent like tea waste.

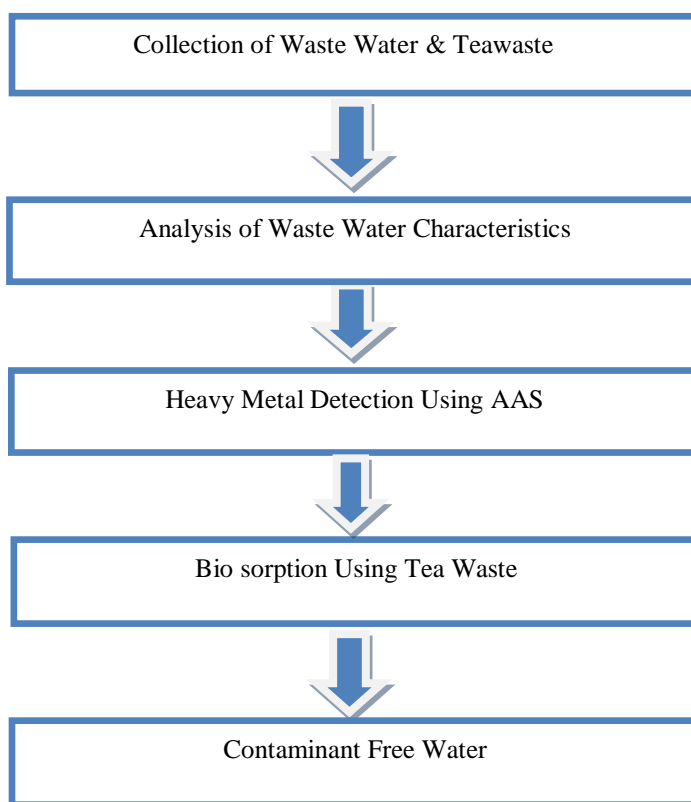

Methodology:-

Fig:- Flowchart for Experimental Investigation

Collection Of Sample:-

The textile industry which consumes very large volume of clean water for a sequence of processes produces large amount of wastewater. The use of different synthetic dyes during dyeing process contaminated the water drastically. The effluents, thus generated from textile industry, are strong in color, high in COD and BOD and less biodegradable. Textile industrial waste water is one of the most pollution sources. It can cause environmental problems related to its high organic matter, suspended solids and heavy metal concentration. The sample is collected from the textile industry in Madurai district. Initially the sample is stored in the plastic bottle and is preserved in a refrigerator in order to prevent the attack of micro-organisms.

Fig 1:- Discharge Of Textile Industrial Wastewater

Biosorbent Used:-*a) Tea waste*

Tea beverages are available as green, black or oolong tea depending on the way of manufacturing. Waste tea leaves contains lignin, cellulose & hemi-cellulose. Their high adsorption capacity is observed in solutions with pH range more than 4. The aminated bio-sorbent is used to remove metallic pollutants like lead and zinc.

b) Properties & Characteristics:

Formation of surface complexation mechanism between metal ions & ligno cellulosic adsorbent are responsible for the absorption of metal contaminants. The rough surface and widely distributed pores can offer greater surface area and more binding sites for metals.

Fig 2:- Extract of tea waste.

c) Applications of tea waste: Utilized in agricultural field to enhance the production under heavy metal stress. Abundantly available & cheap. High metal binding capacity & Helps in reducing turbidity. After adding tea waste in industrial water, the water can be reused for various agricultural and domestic purposes.

Adsorbent Preparation:-

The extract of tea powder, after it is being used as beverage is taken and is boiled till the extract gets decolorized. This tea waste is again washed with distilled water and then dried in hot air oven at 100°C. The obtained dried tea waste is screened through 150 micron IS Sieves and is used as adsorbent. The tea waste is sealed in polyethylene for

preservation so that it does not react with neighboring environment. These poly ethylene are placed in freezer so that tea waste does not get degraded. The experiments were performed using two different concentration of adsorbent dosage i.e. 0.5g and 1.0g of tea waste

Experimental Study Of Waste Water Sample Before Adding Tea waste:-

Atomic Absorption Spectroscopy:-

Atomic Absorption spectroscopy is a “spectro-analytical procedure for the quantitative determination of chemical elements using the absorption of optical radiation (light) by free atoms in the gaseous state”. As per the results obtained from atomic adsorption spectroscopy, the metals present in our sample collected from textile industry are as listed below:

Table 1:- Concentration of heavy metals in sample using AAS

S.NO	PARAMETERS IN SAMPLE	UNITS	AS PER STANDARDS (TOXICITY RANGE)	MCL	RESULTS
1.	Lead	mg/l	0.006		<0.01
2.	Chromium	mg/l	0.05		0.37
3.	Cadmium	mg/l	0.01		<0.01

Over-review of results obtained from AAS & Applications:-

From the results of atomic adsorption spectroscopy, the concentration of chromium is found to be high i.e. (0.37) compared to lead and cadmium with respect to IS Specifications. So the removal of chromium from the sample is necessary. Now, the sample containing chromium is treated by varying the dosage of tea waste and the results are compared.

Applications: It is useful in chemical analysis because of its specificity and its quantitative nature. It is widely applied in the fields of water resources because of its identity in detecting the heavy metals even in significant value.

Physio-chemical characteristics of waste water:-

Table 2:- Physio-chemical characteristics of Waste Water before adding Bio-sorbent

S.No	PARAMETERS	VALUES BEFORE ADDING BIOSORBENT
1.	Color	Brownish yellow
2.	pH value	6.68
3.	Turbidity value	12.3 NTU
4.	BOD(3days)	5.65 mg/l
5.	Total suspended solids	52900 mg/l
6.	Total dried solids	38000 mg/l
7.	Total fixed solids	1000 mg/l
8.	Total volatile solids	2000mg/l

Results and discussions:-

Effect on pH and turbidity:-

pH and turbidity variation are one of the important parameters controlling the uptake of heavy metals from waste water and aqueous solutions. pH is a term generally used to express the intensity of the acidic or alkaline condition of a solution. It is defined as the negative logarithm of reciprocal of the hydrogen ion concentration in moles per liter. The pH scale value ranges from 0 to 14; the value of 0 to less than 7 ranges indicates acidity and greater than 7 to 14 alkalinity. The effect of adsorbent on pH increases with increase in the concentration of adsorbent dosage and the turbidity in the sample decreases with increase in the concentration of tea waste.

Effect on total suspended solids:-

Total suspended solids are the dry weight of particles trapped by a filter. It is a water quality parameter used to assess the quality of wastewater after treatment plant. TSS was previously called non-filterable residue (NFR) but was changed to TSS because of ambiguity in other scientific disciplines. The amount of total suspended solids shows drastic decrease in value with increase in the concentration of adsorbent dosage of 50mg and 100 mg for an optimum contact time of 120 minutes

Effect of total fixed solids & total volatile solids:-

Total dissolved solids is a measure of the combined content of all inorganic and organic substances contained in a liquid in molecular, ionized or micro-granular suspended form. Although TDS is not generally considered as a primary pollutant it is used as an indication of aesthetic characteristics of drinking water. Primary source for TDS in receiving waters are agricultural and residential runoff, leaching of soil contamination and point source water pollution discharge from industrial or sewage treatment plants. In our present study to determine the amount of total dissolved solids present in the waste water a silica crucible is taken and its empty weight is taken as w₁. About 100 ml of sample is filtered using filter paper, and the silica crucible along with the filtered water is placed in the water bath maintained at 900°C till the water is evaporated to dryness. After drying, the crucible is cooled to a little above the room temperature and kept in a desiccator for 1 hour, and that crucible is weighted as w₂, the difference between w₁ and w₂ gives the value of total dissolved solids. The amount of total fixed solids decreases with increase in the concentration of adsorbent dosage. The graph shows the variations in total fixed solids values for the addition of adsorbent dosage of 50mg and 100mg. The amount of total volatile solids decreases with increase in the concentration of adsorbent dosage. The graph shows the variations in total volatile solids values for the addition of adsorbent dosage of 50mg and 100mg.

Effect on Biosorption efficiency:-

The concentration of chromium decreases with increase in concentration of chromium for the contact time of 120 minutes. The maximum percentage of adsorption is found to obtain for 100 mg of tea waste per 100 ml of sample solution.

Table 3:- Physio-chemical characteristics of Waste Water after adding Bio sorbent

S.NO	PARAMETERS	0.5g TEAWASTE	1.0g TEAWASTE	CONTACT TIME
1	COLOUR	Mild yellow	Pale yellow	120 min
2	pH	7.17	7.22	120 min
3	Turbidity	8.6	4.4	120 min
4	Total suspended solids	200mg/l	20mg/l	120 min
5	Total fixed solids	360mg/l	70 mg/l	120 min
6	Total volatile solids	340 mg/l	50mg/l	120 min
7	Adsorption efficiency	81%	96%	120 min

Fig 5:- Biosorption efficiency of chromium

Conclusion:-

Wastewater contamination is an ever increasing problem which the whole world is facing now. Industrialization & globalization has led to the tremendous increase in use of heavy metals over the past decades. This has inevitably resulted in increased flux of metallic wastes in marine, ground, industrial & even treated waste waters. As far as the modern treatment processes are concerned, removal of heavy metals are very expensive, require high energy and generate toxic sludge which pose serious threat to the whole ecosystem. Nowadays, the use of natural, low cost & effective biosorbents are being highly recommended. As well as the method of bio sorption can help in removing heavy metals to a greater extent. For this project, agricultural waste i.e. Tea waste is used as adsorbent for the removal of heavy metal like, chromium, cadmium & lead. With this new combination, it is possible to produce pollutant-free water & pollution-free ecosystem thereby reducing metallic pollution at low-cost, simple, efficient & by natural means. From the results and discussion, the maximum adsorption of 96% is found by adding 1.0 g of tea waste per 100 ml of wastewater.

Abstract

Hamelia patens Jacq. commonly called fire bush, is a fast growing, semi woody and evergreen perennial shrub of the family Rubiaceae. It is a native of central and southern Florida. It is chiefly grown for the showy bunch of beautiful flowers. In tropical America, local people make use of the extract of its leaves and stem, for curing diseases such as skin rashes, sores, insect sting and various fungal diseases of the skin because of its antibacterial and antifungal properties. In India this plant is particularly cultivated on a wider scale in home gardens as an ornamental plant. In *H. patens*, sexual reproduction is difficult due to self- incompatibility, while crossing between morphologically different plants of two accessions gives viable seeds. In the present study two varieties of *H. patens*, *H. patens* variety *patens* and *H. patens* variety *glabrawas* chosen to study the activity of four enzymes, namely, peroxidase, acid phosphatase, polyphenol oxidase, esterase and total protein. Three developmental stages were identified for both the plants. Controlled pollinations were carried out in the two plants. Stigma of two varieties were pollinated with its own pollen and also pollen from other variety. Crossed stigma showed higher activity of all the enzymes than self- pollinated and stigma from flowers before anthesis. The aim of the study was to understand if pollination with self and crossed pollen grains has any influence on the activity of the four selected enzymes in post pollinated pistils. The enhanced activity of these enzymes indicates their role mainly in the defence mechanism than anything to do with stigma receptivity. The results have been discussed in the light of the available literature.

Introduction:-

Hamelia patens Jacq. is commonly known as scarlet bush or firebush. It is a large perennial shrub or small tree. Also, the plants are used in folk medicine against a range of ailments. All parts of *H. patens* are used in natural medicine. A number of active compounds have been found in firebush, such as apigenin, ephedrine, flavanones, isomaruquine, isopteropodine, maruquine, narirutins, oxindole alkaloids, palmirine, pteropodine, rosmarinic acid, rumberine, rutin, seneciophylline, speciophylline, isopteropodine, stigmast-4-ene-3,6-dione and tannin (Cavanagh 1963, Duke 2007, Aquino et al 1990, Ahmad et al 2012 & Paniagua et al 2012) (-)-hameline, tetrahydroalstonine, aricine, uncarine F, stigmast-4-ene-3, 6-dione and 5,7,2-,5- -tetrahydroxyflavanone 7- rutiroside (Aquino 1990, Ahmad et al 2012 & and

Address:-Department of Botany, University of Kerala, Kariyavattom, Thiruvananthapuram-695581.

Paniagua et al 2012). The bark also contains significant amounts of tannins. Firebush contains crude protein and has *in vitro* digestibility (Ibrahim 1997). The plant possesses analgesic, antispetic, anti-inflammatory, febrifuge, refrigerant properties. Fruit of *H.patensis* edible (Irobi et al 1996) and the plant is used in herbal medicine to treat athlete's foot, skin lesions and rash, insect bites, nervous shock, inflammation, rheumatism, headache, asthma, and dysentery (Lachoria et 1999 and Liogier 1999). Ethanolic extract of different parts like leaf, stem and root of *H. patens* shows anthelmintic and antimicrobial activity (Sapana 2012). It has been reported to exhibit that this plant possesses anti-diarrhoeal activity (Salud 1996). It is also used for insect bites, menstrual disorders, uterine and ovarian affliction (Shrisha et al 2011). Cytostatic and cytotoxic activity against tumor cell lines (Taylor et al 2013) and wound healing activity (Sandhya et al 2011) with *H. patens*. Antifungal properties of aqueous extracts of leaves, flowers and fruits of *H.patens* was also reported (Abubacker 2013). Antibacterial properties (Camporese 2003), vasorelaxant (Reyes & Chilpa 2004) and toxicity and antinociceptive effects of *H.patens* also studied (Castro 2015).

Development of fruits with healthy seeds is the culmination of the natural process of pollination and fertilization. Seeds are important for the plant for propagation of the progeny and for a breeder to assess the results of breeding while developing new cultivars. Louis and Radhamany (2009) and Louis et al (2012) reported RNase based gametophytic incompatibility in *H.patens*. Since legitimate and illegitimate pollinations are affected by alternations in the metabolic status of stigma and style tissues (Dhaliwal 1985), it would be imperative to study the changes in the enzyme activities of stigma-style tissues following compatible and incompatible pollination. Since the enzymes control biochemical reactions, and their synthesis is under the control of specific gene(s), any change in the activity of an enzyme would reflect in the pattern of gene expression and corresponding metabolic events in the cell. Hence, the enzymes can be used as tools to study the problem of self-incompatibility at the biochemical level. In the present investigation, changes in the activities of peroxidase, polyphenol oxidase, esterase and acid phosphatase along with total amount of protein have been studied in anther lobe and pistil of two varieties of *H. Patens*; *Hamelia patens* variety *patens* and *Hamelia patens* variety *glabra*, in an attempt to understand the biochemical aspects of self-incompatibility in *Hamelia*.

Materials and methods:-

Two varieties of *Hamelia patens* Jacq. viz. *Hamelia patens* var. *patens* (Fig. 1) and *Hamelia patens* var. *glabra* (Fig. 2) maintained in the Botanic garden, Department of Botany, University of Kerala, Thiruvananthapuram, and pistils from flowers of these two plants were used in the present investigation.

Controlled pollination:-

Emasculation and controlled pollinations were carried out in both the varieties of *H. patens*. Early in the morning, a day before controlled pollination, mature flower buds were emasculated and bagged with butter paper bags at 'pre-balloon' stage, 18–24 h before pollination. For self-pollination, flower bud at the 'balloon' stage was pollinated by dusting the pollen grains from the same flower on the surface of the stigma and bagged. In the cross pollination, variety *patens* was considered as female plant and variety *glabra* considered as male plant. Following samples were collected for the test of isozymes.

1. Sample I-Self-pollinated pistil from the variety *patens*.
2. Sample II- Un-pollinated pistil from the variety *patens*.
3. Sample III-Self-pollinated pistil from the variety *glabra*.
4. Sample IV- Un-pollinated Pistil from the variety *glabra*.
5. Sample V-Pollinated pistil from the cross between variety *patens* x variety *glabra*.
6. Sample VI-Stamen from the variety *patens* after self pollination
7. Sample VII-Stamen from the variety *patens* before pollination
8. Sample VIII-Stamen from variety *glabra* after self pollination
9. Sample IX- Stamen from the variety *glabra* before pollination

Preparation of enzyme extract:-

Part of the pistil without ovary was collected and frozen in -40°C. Sample weighing about 450 mg were homogenized with 9 ml of cold 5% KCl (w/v) using a pre-chilled mortar and pestle. The homogenate was centrifuged at $0 \pm 2^\circ\text{C}$ at 10,000 rpm for 10 min. The clear supernatant was used directly for the assay of enzyme activities and estimation of protein (Jorgensen et al 1953, Ching et al 1987, Neog et al 2003 and McInnis et al 2006).

Assay of peroxidase:-

The activity of peroxidase was assayed according to Malik and Singh (1980). The assay mixture containing 2.5 ml of phosphate buffer (pH 6.5, 0.1 M), 0.2 ml of diluted enzyme extract and 0.1 ml of *o*-dianisidine (1 mg/ml methanol) was incubated at 28°C in a water bath for 2 min. The reaction was started by adding 0.2 ml of H₂O₂. The change in absorbency was recorded at 430 nm using a stopwatch at 30 s interval for 5 min. The enzyme activity was expressed in terms of the rate of increase of absorbance per hour per mg protein.

Assay of acid phosphatase:-

The reaction mixture contained 0.5 ml of substrate solution (50 mg *p*-nitrophenyl phosphate in 10 ml water + 25 ml of acetate buffer, 0.1 M, pH 4.8) and 0.1 ml of suitably diluted enzyme extract. The mixture was incubated at 35°C for 30 min. The reaction was stopped by adding 2.4 ml of 0.1 N NaOH and the absorbance was recorded at 410 nm. The enzyme activity was expressed in terms of micromoles of *p*-nitrophenol released/h/mg protein Malik and Singh (1980).

Assay of polyphenol oxidase:-

The polyphenol oxidase activity was measured as per the method of Sarvesh and Reddy (1988). The assay mixture (3 ml) contained 2.0 ml of 2 M carbonate-bicarbonate buffer (pH 10), 0.15 M of *o*-catechol and 0.2 ml of suitably diluted enzyme extract. The assay mixture was incubated for 2 min at 25°C. The reaction was stopped by adding 0.5 ml of 5% (v/v) H₂SO₄. The change in absorbency was recorded at 420 nm for 2 min. The enzyme activity was expressed in terms of micromoles of quinone formed/h/mg protein.

Assay of esterase:-

Esterase activity was assayed by naphthol-acetate method (Sawhney et al 1981). The assay mixture contained 2.0 ml of 20 mM phosphate buffer of pH 10, 0.1 M of 1-naphthol acetate and 0.2 ml of suitably diluted enzyme extract. Change in absorbance was recorded at 420 nm for 3 min and enzyme activity expressed in terms of micromoles of naphthol-acetate produced/h/mg protein.

Total protein:-

The amount of protein was determined according to the standard method (Bradford 1976 and Lowry et al 1951), using Bovine serum albumin as standard.

Statistical analysis:-

The data were collected from five sets of experiments and were subjected to analysis of standard deviation (Table-1 and Graph 1-5).

Results:-

Discussion:-

Comparative analysis of the activity of four isozymes namely peroxidase, acid phosphatase, polyphenol oxidase and esterase in *H.patens* var. *patens* and *H.patens* var. *glabra* were carried out to find out the differences in the metabolic activity of unpollinated, self-pollinated and cross-pollinated pistils of self-incompatible *H.patens* varieties in the present study. Peroxidase has been implicated as an indicator of stigma receptivity (Galen & Plowright 1987, Dupuis & Dumas 1990, Dafni & Motte-Maues 1998 and Stpiczynska 2003) and mere adherence of pollen grains to stigma has been shown to increase peroxidase activity independent of the penetration of pollen tube (Galen & Plowright 1987, Bredemeijer 1982, Bredemeijer 1984, Bredemeyer & Blaas 1975, Bredemeyer 1975, Bredemeyer 1979 and Linskens 1969). In the present study, significantly higher activity of peroxidase was observed in cross-pollinated styles were noticed when compared to self-pollinated and unpollinated stigma in both the varieties studied. The mean value was found high in variety *glabra* (0.121), followed by variety *patens* (0.117). Peroxidase

enzyme which is known to be a defence induced enzyme (McInnis et al 2006, Cheong 2002, Delannoy 2003 and Do et al 2003). It is possible that pollen grains landing on stigma set in signals which activate peroxidase as a defence strategy. The activity of this enzyme is modified by germinating pollen grains (Bredemeijer 1984). Activities of acid phosphatase showed a considerable variation between self and cross-pollinated combinations. Activity was significantly higher (1.1894) in the styles after cross-pollination when compared with the self and unpollinated stigmas. The highest enzyme activity was noticed in the variety *patens* (1.0634) than variety *glabra* (0.0322). The elevated levels of acid phosphatase in cross-pollinated stigma clearly indicate a role for this enzyme in pollen tube growth in the style. This enzyme is probably produced in response to the penetrating pollen tube for providing inorganic phosphates through hydrolysis of phosphate esters (Ching 1987). Activity of polyphenol oxidase is very low or negligible in stigmas after self-pollination and stigma before anthesis. In contrast, the crossed stigma showed increase in polyphenol oxidase activity over the selfed styles. The highest specific activity for this enzyme was recorded in the cross-pollinated samples of stigma (0.1882) and the highest enzyme activity was noticed in the self-pollinated style of variety *patens* (0.1358) than variety *glabra* (0.1122). The consistently enhanced activity of polyphenol oxidase in the two plants is in line with its possible role in the defence mechanism (Mayer & Harel 1979, Bashan 1987 and Tyagi 2000). In wet and dry stigmas of a wide range of plants the time of stigma receptivity has been correlated with esterase activity (Heslop-Harrison 1975, Heslop-Harrison 1977, Kohn & Waser 1985 and Lavithis & Bhalla 1995). A moderate level of esterase activity is maintained at all the stages of stigma. Esterase activity was higher in cross-pollinated style (0.1848) than other stages of stigma. Also it is noticed that esterase activity was very low in stigmas of two varieties. Higher activity of esterase probably could be a response to the germinating pollen and must be facilitating in the penetration of the pollen tube into the stigma by hydrolyzing the cutin layer (Heslop-Harrison 1975, Lavithis & Bhalla 1995 and Hiscock et al 2002). Estimation of total protein was found to be higher in all the stages but cross-pollinated styles shows higher amount (5.6471) than other stages of stigma.

Conclusion:-

The enzyme may directly act to prevent the growth of selfed pollen tubes or sometimes may remain absent to disturb the growth of the pollen tube (Nettancourt 1977). Higher level of peroxidase found in cross-pollinated styles than in self-pollinated ones indicates its involvement in the regulation of pollen tube growth through styles. One cannot rule out the involvement of peroxidase as a nonspecific factor of the self-incompatibility reaction, but it plays a significant part in this mechanism. There are reports that this enzyme brings about changes in structural glycoproteins, other enzymes, pectin or cellulose present in the pollen tube wall (Siegel & Galston 1955 and Stonier 1979). Higher level of acid phosphatase in self- than cross-pollination as observed in the present study is in agreement with the earlier finding of Dhaliwal and Malik (1985) in stigma-style tissues of *Brassica campestris* var. *Toria*. It can be inferred that the inhibition of pollen tube growth is due to some factor(s) that could cause the production of acid phosphatase in higher quantity. This enzyme is probably produced in response to the penetrating pollen tube for providing inorganic phosphates through hydrolysis of phosphate esters.

Elevated level of polyphenol oxidase in all the experimental samples following cross-pollination supports the complementary hypothesis and the earlier assumption of Mayer and Harel (1979) that the enzyme has the ability to produce quinone and selectively inhibit the activities of some other enzymes. Though the results of the present study do not confirm any direct relationship between this enzyme and the manifestation of self-incompatibility, it is possible that polyphenol oxidase acts as complementary factor along with other elements like environment and genetic makeup of the plant. In wet and dry stigmas of a wide range of plants the time of receptivity has been correlated with esterase activity. A moderate level of esterase activity is maintained at all the stages, to maintain the receptivity of stigma. The elevated amount of esterase in cross-pollinated stigma could be facilitating in the penetration of the pollen tube into the stigma by hydrolysing the cutin layer. Self-incompatibility mechanism in angiosperms is widespread and has received considerable attention in recent years. Self-incompatibility genes have been identified, characterized, cloned and transferred to self-compatible lines in several species (Hoopen 1998 and Brien 2002). From the present study, it may be concluded that significant changes in the activities of certain key enzymes occur in the stigma and style tissues of *Hamelia patens* following compatible and incompatible pollination. Variations in the enzyme activities as observed in the present study shows that the biochemical changes occur in the stigma style tissues affected by self-incompatibility mechanism that in turn affects the metabolic status of these tissues. As the synthesis of these enzymes is controlled by their corresponding gene(s), their quantitative changes may be due to the changes in the regulation of expression of gene(s) and hence offer a basis to study the mechanism of self-incompatibility at molecular level.

Abstract

The very existence of Holocene is debated for its tenure and transcendence by a new epoch "The Anthropocene or the age of man". The transition between two epochs is in breakthrough dialogue as human intervention to enact the hydro-meteorological, geological and biological stratigraphic changes. The homo-sapiens are the dominant forces where the earth is exponentially transforming. The exo-planet aliens, PHAs or NEOs can drive the new epoch to be apocalyptic. The era is considered as Eurocentric and launched either from Industrial revolution or from dates of nuclear explosion. The human centric activities like modernization, advancement in science, technology, hydrologic interventions, disproportionate GHG's etc. are the indicators of the new eon. The researchers have wide scope now to use ample anthropogenic, climatic, biologic and geologic data for study but which was underreported or non-reported in past. The burgeoning data available from NASA, FAO, disaster sectors, geo-engineering and bioengineering etc. have been used for the present study. The legacy of the Anthropocene is said to have propagated in spells and phases from Europe to Indian subcontinent. The shift of the epoch is geospatial in geographical time scale. The present study envisages a nonparametric approach about the influence of the earth system of Indian subcontinent by human impact. Investigation is done to ascertain the causes, impacts, effects, longevity of the human dominance over natural variability. The Anthropocene is greatly accelerated with the great oxidation and carbonization processes but the effect of the epoch can be delayed and decelerated by development in geo engineering, bio engineering, smart technology and Nano science etc. The spell, its identity, uniqueness and management of the epoch to avoid both ecologic and economic extinction are discussed in the present research.

Introduction:-

Hominids predominate in the Holocene epoch as per the records of International Commission on Stratigraphy (ICS). But the concept of succession of the new epoch, "The Anthropocene", was claimed by a Dutch chemist Paul Crutzen, Stoermer in (2000) ^[1]. Crutzen (2002) ^[2]. The working groups of International Union of Geological Sciences (IUGS) though not officially, declared the onset of the epoch Anthropocene, but admitted about the planetary shift of the new geological age. The epoch relates to the word "anthropo" (man) and "cene" (new) where the Homosapiens have dominated the atmosphere, earth crust, ocean, and nutrient cycles.

Geologically Mesozoic era (the age of dinosaurs), then Cenozoic era (the period of mammals) were succeeded by the Quaternary period without human activities till the tertiary era Fig 1(a). The Quaternary period consisted of the Pleistocene when Homosapiens developed their activities (2588000 to 11700 years BP) succeeded by the Holocene (11700 years BP to present). Present period is the Pleistocene interglacial age accepted by the International Geological Congress in Bologna in 1885, Steffen et. al., (2007) [3]. The Holocene age is classified as early, (11700-8000BP), mid (7999- 4500BP) and late (4500 BP to till date). It prevailed from the warmest period (hunter stone age) after a long ice age during upper Pleistocene period (<http://www.stratigraphy.org/ICSchart>). Thereafter drop in temperature was observed during the little ice age which continued till 1700 AD in northern Hemisphere. The temperature further started rising from 1700 to 2000AD but not like hunter stone age. The Holocene had many small ice ages and warm periods like Minoan, Roman and Medieval with only one prominent cold period i.e. "The little ice age" (<http://www.dandebat.dk/eng-klima7.htm>) Fig 1 (a), Fig 1 (b).

Now the researchers have wide scope for anthropogenic, climatic and geologic studies with ample data which went underreported and non-reported even upto 19th century. Present study reveals the causes, period of prevalence and felicitation of the impact and future effects of the new epoch. The period of start of the epoch, impact of the predictors, parameters, indicators, age and management in Indian subcontinent are discussed in the present research.

Review of literature:-

The Anthropocene entered the geological literature by Paul Cruzen (2002) [2] and further acknowledged by different scientists and engineers like Steffen et al., (2004) [4], Syvitski et al., (2005) [5], Crossland, (2005) [6], Anderson et al., (2005) [7] informing about the end of the Holocene epoch and start of a new epoch where the environment is overruled by human commotion. Anthropogenic activities are the deciding factors in the change of climate, reported by the working group of the Intergovernmental Panel on Climate Change (IPCC). In their assessment report AR3 (2001) [8], AR4 (2007) [9], (2010) [10] and AR5 (2014) [11] have reported the human activities vs. climatic and hydrologic changes (dominant being global warming) are interrelated by 66% (certainly), 90% (very likely) and 95% (extremely likely) from 1950's respectively. Sir David Attenborough, (2006) [12] claimed record-breaking cold waves and rainfall in some parts of the globe disapproves the global warming and made a distinction between the climatic change and weather patterns. WMO have reported 1990's is the warmest century of the millennium.

Stormberg, (2013) [13] has reported that two billion years ago, vast proliferation of the oxygenated cyanobacteria in the atmosphere, forcefully made the living creatures on the earth to an extinct species. Presence of late quaternary strata with youngest Toba Tephra events (Toba super volcanic eruption) in the basins of peninsular rivers, carried valley sediments due to wetted monsoonal phase in the deltas. Hominid fossils (short and stocky pygmies) became extinct in central India during that period. Tandon et. al (2014), [14] Peter Fisher, (2014) [15] rightly stated that progenitors shall have a horrid mechanical future and current species are under mass extinction and we will generate a polluted world by inventing novice chemicals. Bruce hall, (2015) [16] have reported that the Anthropocene epoch shall devastate India as 70% of houses shall be constructed due to migration from rural to urban areas. The wells, rivers and farms shall run dry and be abandoned. India shall produce 4% of GHG gasses of the globe and 40% of population shall have inadequate energy. According to Matt Atherton, 2016 [17], identified five causes for the Anthropocene epoch are Industrialization, population, new materials, Biogenic changes and changing water ways. The Anthropocene epoch started with industrial revolution in early 16th century or as consequences of testing of the first atom bomb in 1940's or from the date of start of nuclear weapons in 1960's. Osborne claims the epoch was

initiated with geologic activities like meteorite slamming, volcanic eruptions, continents shifting, earth quake and the atomic explosions *Hannah Osborne*, (2015)^[18]. The start of his epoch has been a subject of much debate. Some have said it started during the Industrial Revolution from 1760, while others have suggested nuclear weapons testing in the 1960s heralded in a new era in the planet's history "the Anthropocene" Stanley et al (2016)^[19]. Steffen, (2007)³ reported that "The great acceleration" of human forcing on the planet have started a new age 1950's onwards. Davos, (2017)^[61], deliberated 12 parameters of anthropogenic forcing and 12 parameters of environment activity of the Earth's systems responsible for the change in the geographic period "the Anthropocene".

The Anthropocene epoch in controversy:-

To establish the new epoch, selection of a Global Boundary Strato type Section and Point (GSSP) or acceptance of its inception date need be approved by the ICS (International Commission on Stratigraphy) to find a place in GSSA (Global Standard Stratigraphic Age). We are in the Phanerozoic Eon, Cenozoic era, Quaternary period and Holocene epoch as per ICS calendar till date. The IUGS, an official unit of the ICS, is yet to approve the epoch "the Anthropocene" Zalasiewicz et al (2008)^[20], 2010^[21]. The ICS Sub-commission on Quaternary Stratigraphy established a working group in 2009 to address the strategy. Since then, discussion and deliberations on of the Anthropocene became extensive in scientific publications, the public media and in the greater academic sphere. The proposal that the confusion between the definition Chrono-stratigraphic unit as system, series, stage and Geochronologic units as period, epoch, age adopted by GSSPs, as unit, the Anthropocene was rejected in ICS workshop (2010), Zalasiewicz et al. (2014)^[22]. To have a breakthrough to the dialog on the epoch, Anthropocene, congregation of the group is going to meet at Cavallo Point, Sausalito, California from 21st June to 23rd June, 2017.

Anthropocene, Indian scenario:-

The Anthropocene is unofficially accepted with (a) priming period from the age of last warm period from 3000 years BP to 18th century (b) the margin (1850-1944) (C) the fundamental shifts (1945- 1980), (d) The great acceleration (1981 to till date). The geospatial behavior of the epoch had impacts in phases which changed the human activities from hunting and farming to the modern life. Presently it is to be accepted that we are in the Anthropocene epoch in India. The admittance of the new epoch has become more factual than less political today as reported by Zalasiewicz et al (2014)^[23 a & b]..

Establishing the shift in India:-

The Priming (3000BP-1849AD):

Early human impacts on the land use and land cover started from the great warm period, 3000 years BP (Barnosky, 2008^[24], Ellis et al 2011, 2012, 2013, 2014^[25-28] and Wilkinson et al 2014)^[29]. Many terrestrial biotic and marine micro biotic changes altered the CO₂ levels due to socio political developments, conversion from hunting to agriculture. continuous formations in the Himalayan range of mountains, undermining of the river Saraswati, desertification of Thar in India, decline of the ancient civilizations, the Mohenjo-Daro and the Harappa are the artifacts of formation of the new epoch. The pollen grain tests, carbon dating data and strand line records indicate about the reforms of land scape. The conversion of gulfs to lagoons/lakes (the Chilika Lagoon and the Pulikat Lake), marks of high MSL (mean sea level) along coast, conversion of jungles to rural settlements with the knowledge of making metals and alloys indicate about the end of the Holocene era. Archeological findings of underwater monuments at Mahabalipuram, Vet-Dawrika, Ram Setu at Rameswarm etc. relate to the eon changes in Indian subcontinent during the Paleo-Anthropocene period Foley et al. (2013)^[30].

The Margin (1850-1944):-

Sixteenth century is considered to have exhibited noteworthy changes in the world due to continental drive and collision of the meteorological asteroid (The golden Spikes) with major climate changes quoted from Mark Muslim by Rebecca Morelle, (2015)^[31]. The stratigraphic Eurocentric boundary of early Anthropocene reported by Crutzen and Stoermer (2000)^[1], Crutzen (2002)^[2], Water's et al., (2014)^[32] clearly link to the industrial revolution of 19th century with use of the coal based steam engines, shipping and boilers along with the population explosion. The anthropogenic activities shifted gradually to North America, China, India, Japan and many other countries throughout the globe. Industrialization and urbanization are the stratigraphic signals. Energy balance, CO₂ level and devastating famines in India during 19th century are the global indicators to recognize this early Anthropocene. The Q-class NEA asteroids named Apollo 1862, having dimension 1.7 km were the potentially hazardous asteroid (PHA) which along with erratic El Nino southern oscillation activities (ENSO) might have caused meteorological famines in India in the 19th century. The gigantic meteor that slammed Tunguska region of Siberia in 1908 has left the debris and carbon particles scattered in the atmosphere with very high energy which had the impact of huge mass

extinction of species. Erratic rainfall, massive recurrent floods with heavy sediment inflow and huge death due to vectors indicate the drive of the new age in India.

The fundamental shift–Anthropocene (1945-1980):-

The demography, the energy balance, GDP vs. ecological changes, amount of carbon, drastic climatic changes and globalization brought an end to the influence of the Holocene era by mid-20th century (Steffen et. al 2004^[33], 2007^[3], Barnosky, 2008^[24] and 2014^[35], Steffen et al. 2007^[312]. The human impacts which motivated the era from 1945 after the testing of Trinity A-bomb at Alamogordo, New Mexico, 1945 and Hiroshima and Nagasaki in World War II, 1945 brought the fundamental shift. More than 500 atomic tests were conducted then which increased the nuclides in the atmosphere due to the fission and fusion activities. The circulation of the nuclear debris (14C, Pu-239, Pu-240, Cs-137) received from radio activities drastically changed the atmospheric extension and metabolism, Walker, (2005)^[36]. Drilling activities in mines, petroleum wells, oil spills from marine oil tankers, hydrologic interventions, diesel and petrol engines, infrastructural developments, industrial/ agricultural-related signals, uses of plastic, techno fossils are considered triggering as the transit for the early Anthropocene in the globe and also in Indian sub-continent, Zalasiewicz et. al., (2014)^[23], Hancock et al., (2014)^[37], Wolff, (2014^[38]); Waters et al., (2015)^[39], Morrison (2015^[40]), Jain et al (2016)^[41].

The great acceleration:-

The Anthropocene epoch was focused on a small population consisting of the Organization for Economic Co-operation and Development (OECD) countries during the fundamental shift period only. The prolongation of the changes became rapid, homogeneous, consistent and widespread all over the world with the great acceleration trend from 1980 onwards - till date. With reduction of the British territory there was the fast growth of tourism, circuit engineering, science, technology, industry, urban development and economic ties all over the world. The human impact on the biosphere accelerated in the developing countries like India, China, Brazil and Indonesia and many other countries. Terrestrial mini asteroid, Chelyabinsk fire ball, 2012 DA14, orbiting at a distance of 2700 km blocked the solar radiation covered significantly resulting in meteorological catastrophe like chilled Japan during winter Dec. 2012 to Feb. 2013 (NASA). Emphasis on technology, geo-engineering, green engineering, Nano science, genome and dechronification technology and many others have changed the human decree over nature.

Substantiating the Anthropocene:-

Davos, (2014), stated 12 parameters of anthropogenic forcing are global warming, greenhouse gas (GHGs) emissions, polymerization, oceanic acidification, eutrophication, industrialization, urbanization and deforestation etc. The signatures related to Anthropocene are habitat loss, species invasions, mass extinction, predation, damming, GDP changes, and energy consumption and many physical and chemical changes, etc... He also pointed other 12 non-anthropogenic parameters of the Earth's systems which can cause devastation and shift of epoch are the Sun earth geometry, ozone depletion, volcanic eruption, tsunamis, earth quakes, oceanic disturbances, coastal erosion, PHAs, NEAs and biodiversity changes etc.

The Anthropocene epoch can be substantiated mainly in India by massive extinction of species ecologically, the global warming, rise in concentration of CO₂. Global warming has accelerated melting of ice and retreating of glaciers which have changed the ecology and biodiversity of the Himalayan glaciers.

Plastics and building wastes and its layers started forming as stratigraphic layers in soil for the future. A stable layer of airborne particulates of sediment and glacial ice shall accrue black carbon from CO₂. There shall have large impact on the nitrogen, phosphorous cycle due to excessive use of NPK fertilizers. Creation of dead zone in sea due to eutrophication shall occur for the aquatic biome. Conversion of forests to settlements, cropland, grazing zone and livelihood are the signals for the Anthropocene in India Fig 2 (a), Fig 2 (b) and Fig 2(c).

Fig 2(a):-Man pre Holocene epoch (Indian express 2nd Mar 2017), **Fig 2(b)** Man in Holocene epoch (<http://www.livescience.com/28219-holocene-epoch.html>) **Fig 2 (c):** Man in Anthropocene <http://www.smithsonianmag.com/science-nature/what-is-the-anthropocene-and-are-we-in-it-164801414/http://www.livescience.com/28219-holocene-epoch.html>

Are all monstrous disasters anthropogenic?

Table-1 depicts ten major disasters in India and in the globe. Except one, none of the disasters of the world was anthropogenic. They were either hydro-meteorological or geological which negates the fact that the new epoch is human centric. But it has been established that by proper management and adaptation, the impacts from hydro-meteorological or geologic disaster can be ameliorated and fatalities can be reduced. Examples are the great Bihar famine 1966-67, the drought in Maharashtra 1970-73 and the VSCS Phailine- 2013 where the demographic consequences were less.

Table 1:- The monstrous disasters in the globe and in India from past records available

INDIA				WORLD			
year	Name and place	Death Million	Proponent (changes)	year	Name and place	Death Million	Proponent
1770,	The Bengal Famine (Bihar/Odisha/ WB)	10.0	Climate	1887	Yellow river flood, China	0.9-2.0	climatic
1737	Calcutta Cyclone (Bangladesh/WB)	0.35	Climate	1920	Haiyuan earthquake, China	0.273	Geologic
1839	Coringa Cyclone (AP)	0.32	Climate	1931	China flood	1-4	climatic
1876	The Great Famine (India)	30	Climate	1975	Typhoon Nina (Banqiao Dam failed)	0.23	anthropogenic
1993	Latur Earthquake (Latur and Osmanabad)	0.02	Geologic	1970	Bhola Cyclone, India/Bangladesh	0.25-0.50	climatic
1999	Odisha Super Cyclone	0.01	Climate	1976	Shaanxi tremor, China	0.83	Geologic

Footprints of Anthropocene in India:-

Burgeoning Demography:-

The analysis of population growth rate in the world and India have shown continuous rise from 1960-70 onwards, the annual population growth is declining from 1960-70 onwards till date. The population growth of poultry have

risen abruptly with the demographic growth of people where as growth of other live stocks is slow as against human growth. The impact of demography in the earth, India and population variations of the live stocks are in Fig 3 (a)

Fig 3(a):- The world, Fig 3 (b) Indian population and Fig 3 (d) livestock population, India from the year 1950 -2017

Fig 3 (c) the rate of population growth from 1980 onwards (source: <http://www.populstat.info/Asia/indiac.htm>
Source: <https://ourfinetworld.com/2012/03/12/>

Hydro-meteorological extremes:-

The Climatologic indicators for the Anthropocene are GHG's, water, Waste, Biomass, LU&LC, vectors, microorganisms, transport and energy whereas the observed events are Cold wave, fog, snow storms and avalanches, hailstorm, thunderstorm, smog, dust storms, heat waves, avalanche, lightening, heavy rain, floods, saline water intrusion, droughts and many others. The global climatic observing system (GCOS) and their essential climatic variables (ECVs) are the watchers recording about 50 atmospheric parameters (Surface, upper air and compositions of GHG's, ozone layer, aerosols and reinforced by their antecedents), Oceanic (Surface and sub-surface and terrestrial). The sectors where impacts observed are ocean, rainfall, temperature, biodiversity, health, soil, agriculture, disasters and extreme events.

Rainfall/snow fall:-

Monsoon rainfall in India from post Holocene and pre Anthropocene, from year 800 to 2200 AD (modeled) Fig 4 (b) shows the rise and fall. After 2020 during Indian South west monsoon shall decrease Fig 4(a). There shall be increase in rainy days and decrease in frequency of depression and SW monsoon annual rainfall particularly in Himalaya region Fig 4(a). The peak rainfall shall decrease in NE India which was giving maximum rainfall in India (Cherapunji). Rainfall in peninsular India shall decrease. Summer Monsoon in India may have abrupt transitions and fail due to climate change Jacob et al, (2012)^[42], Leverman A (2009)^[43]. The western disturbances originating from Caspian Sea have increased in frequency, intensity and duration during the epoch.

Fig 4(a):- Monsoon rainfall in India (year 1813 to 2009 AD) Fig 4 (b): The monsoon and annual rainfall of western India in Holocene period (radio carbon dating). (source: H. H. Lamb, Climate, History and the modern world)

The storms, floods and droughts:-

The storms, earth quakes, tsunamis and famines are the monstrous killers in the Indian subcontinent during Anthropocene. 30% and, 25% of cyclonic storms formed in of Bay of Bengal and Arabian Sea respectively have risk for 32crores of coastal people. The new epoch has invited urban floods which engulfed the cities like Calcutta, Bombay, Chennai and Bhubaneswar in great acceleration period in India due to impervious concrete jungles and inadequate drainage system. Poor people are sustainable to high impact due to increased floods and droughts. WG I, IPCC, AR-5^[11] reported that India shall face mortality of 86% from tropical storms. The SLR and storm impact can enhance significant vulnerability with climate changes. Droughts and famines are the signals of the end of Holocene in 19th and 20th century (fig 5 (a), 5(b) and 5(c)).

Fig 5(a):- Sup. Cyclone Odisha 1999 (b) Bhopal gas woes (1972) by S.N. Sardi (c) Extinct fishes-2016 M. Snyder

Global warming:-

World Bank Group pointed about prevalence of historical warm climate from 1970-80 and predicted that 4°C rise shall have substantial impact on agricultural yield in India. Deccan plateau shall form zones of “Heat Islands” triggering frequent floods and drought. Wet year shall be wetter and dry years shall be drier. IPCC (AR-5) estimated small average change in SAT and SST of the earth during 1906 to 2005 the change was 0.74° C. About 90-95% of global warming is transferred to sea. The National Oceanic and Atmospheric Administration (NOAA) have fixed seven increasing indicators (SST, SAT, Ocean air temperature, MSL, oceanic heat content and inland temperature) and three decreasing indicators (glaciers, snow cover and icebergs in sea). The critical high temperature shall shift to Oct in northern region and in south India, to pre-monsoon (April and June). The early paddy shall have bumper yield in south India, and devastate coral reefs by bleaching action Koronowski, (2016)^[44]. It is observed that the rise of 5°C in SST shall cause SAT rise of 2°C inland Fig 6 (a) and (b).

Fig 6 (a):- Average temperature anomaly of Indian subcontinent for the period 1901 to 2015

Fig 6(b):- Temperature anomaly of earth in K-years before present (Johan Rockstrom, Stokholme University)

Heat waves and Lightening:-

There is dynamic rise in temperature with a maximum in the year 2012 in 21st century. The ten top ranked Heat Waves death in the globe's history in 21st century are 71130 in Europe (2003), 55,736 in USSR (2010), 3,418 in Europe (2006), 2,541 in India (1998), 1,826 (probable) in India (2015), 1,693 in U.S. and Canada (1936), 1,260 in U.S. (1980), 1,210 in India (2003) and India 1,030 in (2002). The figure indicates that frequent heat waves have hit India in the early 21st century. However India had the hottest year, 2016 and the hottest day with highest mercury of 51°C in Rajasthan at Phalodi on 23rd May 2016. Lightening in stratosphere, electro-dynamic anomalies and thermal irregularities have increased the trend of heat waves and lightening deaths in India (Fig 7).

Fig 7:- the heat wave and lightening fatalities are having rising trend from year 1979 to 2014

Tornadoes and thunderstorms are common during pre-monsoon in central, north and north-east India causing loss to properties, crops and fatalities which is related to the acceleration of the new epoch. The highest recorded mortality was 500 in tornado at Dhaka in 1977 and casualties of 6000 people.

GHG gasses:-

CO₂ is one of the major greenhouse gases (GHG's) that traps heat in the atmosphere which reached maximum record in 2012. It is continuously accelerating and drifting upward which can drive hydro-meteorological changes and will bring variations in our planet in future during the new epoch (WMO report 2013). GHG's are natural and essential for humans. Methane (CH₄), carbon dioxide (CO₂), oxides of nitrogen (mainly N₂O), hydro-fluorocarbons (HFCs), per-fluoro-carbons (PFCs), trifluoro-methyl-sulphur-penta-fluoride (SF₅CF₃), sulphur hexa-fluoride (SF₆) and Water vapor are the main causes for global warming. Since 1950, India has produced roughly 4, 2 billion tons of carbon respectively. The annual generation of carbon per capita in India was 1.9 tones which was less than that in China and USA but it had increased three times since 1990 and doubled by 2009 to 2014.

Effects of CO₂:-

The natural carbon cycle is slower than the human-induced climate changes. According to Dana Nuccitelli (2016), O' Day^[45] from NOAA, CO₂ level reached maximum in the year 2015. The residence time of CO₂ is 4-15 years, which is very short (IPCC). Then reason for short residence time of CO₂ in the atmosphere and increasing trend negates the fact of its increase in the atmosphere contradicting the increase carbon level. Cawley Gavin^[46] reported that the temperature of the earth have risen to 1.5–3°C. It is estimated that the rise in temperature on earth

surface shall be warming the atmosphere over the coming decades and about 30 billion tons shall be pumped by the earth to warming over the coming decades and pumping about 30 billion tons of CO₂ shall be pumped by the earth to the air every year. Debating on CO₂ emission and climatic change, the Climate Commission, Australia, reported their climate change in 2001-2010 of 21st century as 'critical'. In India and in the globe the CO₂ emission is raising gradually Fig 8 (a) and Fig 8 (b).

GHG gases are classified as brown (industrial) Green (from inland vegetation), Blue (oceanic biomass) and black (incomplete combustion of fossil fuels) Leahy Stephen, (2007)^[47]. The status of CO₂ was @ 379ppm in 2005 whereas it was 283 ppm before the industrial revolution i.e. in 18th century. Concentrations of CO₂ in the atmosphere were 142% higher than what they were before the Industrial Revolution (WMO greenhouse gas bulletin-2013). In this new age, the CO₂ level shall be high to give many marine organisms less time to adapt. Some marine creatures are growing thinner shells or skeletons that will play a crucial role in the biodiversity and in food chain.

Fig 8 (a):-Global CO₂ emission global annual trend Fig 8(b) CO₂ emission in India annual trend (1970 to 2014)

Geohydrology:-

Geohydrology potential in ground water table (GWT) in India have changed due to over exploitation as 60% land is rain fed. Fifteen percent of India's groundwater resources are overexploited without retrospective recharge. This shall invoke subsidence. Growing population, comfortable life styles, modern utilities, services and industries demand shall urge to draw more GW with less recharge hence more depletion and increased salinity intrusion along coast.

De-glaciation:-

Westerly Jet dominated NW Himalayas and Karakoram ranges are stable. The NE Himalayan glaciers are retreating due to erratic SW monsoon and global warming. At 2-4⁰ rises in temperature, this shall increase discharge in Ganga, Indus and Brahmaputra. Pervasive mass losses in Himalaya and drops in snow cover in glaciers shall accelerate during the 21st century and cause water scarcity, hydropower deficit, and variability in seasonal flows from Hindu-Kush and Himalaya in India (IPCC AR -4). The rivers from Himalaya's shall enhance the frequency and intensity of floods affecting the huge coastal population of 62 million. The ice mass in poles is melting and sheet moving to warmer region since last two decades losing 215 Giga tones annually and add to mean sea level rise along the coasts (IPCC AR-5). The huge sediment reaching the deltas shall protrude and distort the Ganga-Brahmaputra delta prominently during great acceleration of Anthropocene.

Mean sea level rise:-

High emission, movement of ice sheets in a warning region, melting of ice in Himalayan glaciers and the arctic region are signs of the age. Summer urban flooding along low lying coastal areas has been aggravated. There has been change in configuration and dimensions of estuaries/lagoons and positioning of their tidal inlets. The coastal erosion, accretion and submergence have become rampant. The World Watch Institute (2000) has reported that the influences are due to land ice melting (42%), ocean warming (35%) and 12% from inland water.

Coromandel coast line in India has exhibited four to five strand lines during the period of Holocene. Ministry of Earth Sciences, India is focusing on MSL rise as there was increase of submergence, erosion and coastal flooding along the coasts of India. Saltwater intrusion and back water propagation have increased both surface and ground waters. It has impact on mangroves, salt marshes and sediment stratigraphy in lagoons. The SLR reported by Nicholas (2010) is @ 3.3 ± 0.4 mm/year in the globe. But in Indian scenario the SLR was 1.2, 1.75, 1.09 and 5.74 mm/year along coasts of Mumbai, Kochi, Visakhapatnam and Kolkata respectively (Unikrishnan et al ,2006^[48]).

Both the west and east coast of India have been worst affected by disturbances and storm surges Fig 9, Shetye et al, (1990)^[49] and Mishra et al (2014)^[50]. Submergence from flash flood and coastal erosion has made the life of poor worst in islanders of India.

Fig 9:- Shore line shift of east coast and west coast of India per one meter rise of mean sea level

Bio-centric Anthropocene:-

Deforestation:-

Deforestation goes on unabated in tropical forests of India. But study reveals that greenness of vegetation is rising across the globe capturing about 750 MMT of CO₂ annually and reducing 24% of world's GHG emission. 33.33% of India's tropical deciduous forests shall become evergreen due to heavy rainfall in patches of high temperature zone IPCC AR-5 (2014)^[51]. Deciduous forests shall accelerate but growth shall slowdown by demographic pressure.

Pollution of water air and soil:-

Polluted and contaminated air, water and soil and climatic changes shall enhance the risk of water borne and vector borne diseases, mental disorders, post traumatic syndromes, more heat strokes and disaster prone mortality rates. Economic climate resilience actions, the storage reservoirs and integrated basin management can ameliorate the problem.

Ocean acidification:-

About (30%) CO₂ is dissolved in ocean and increases water temperature and decreases alkalinity of ocean water: $H_2O + CO_2 + CO_3A = H_2CO_3$. NOAA-2010 have reported that more acidic sea water and the carbonic acid formed shall disturb the ability of marine plants and animals to thrive, <http://www.noaa.gov/resource-collections/ocean-acidification>. Recently micro-planktons in the ocean are responsible for the sequestration of 25–50% of the carbon which is cumulating ocean acidification. The plankton plays vital role in atmospheric carbon dioxide (CO₂) fixation at lower levels. Otherwise oceanic acidification would have been a peril to environment. World Bank has predicted that 1.4°C rise from present temperatures (in 2030) shall reduce coral growth and at 2.4°C shall either dissolve or dry up them. <http://www.Worldbank.org/en/news/feature/2012/11/18/Climate-change-report>. In India risk zones have developed and shall proliferate to the Andaman, Nicobar and Lakshadweep Islands, Palk Bay and Gulf of Manner, and all lagoons along the coasts.

World Hunger and Food Security:-

Increased droughts and desertification have adversely affected agriculture and livelihoods leaving aside warm weather crops. Melting of glaciers is worsening floods in north India. Rice cultivation is less productive in Nepal forcing the farmers to change their cropping pattern. Advanced agriculture has encouraged swapping of crops by replacing genetically modified crops in last 30 years to combat the food security. Economic and technology advancement for growing population in India has increased average rice production (6% higher i.e. 75MT/Ha) whereas the wheat production in north India have reduced because of rise in temperature from the year 2000. Rise in temperature, intrusion of saline water in coastal zone and erratic monsoon have reduced crop yields and enhanced food insecurity. India shall have agricultural loss of 10% to an extent US \$7 billion if adequate climatic resilience measures are not taken. There shall be stress on food specially the wheat production IPCC AR-5, WRG II, (2014).^[51]

Fig 10:- Production and consumption of different fuel in India between the years 1981 to 2014

Energy and water security:-

Electrical energy of 92378.38 MW (thermal), 4560 MW (nuclear power) and 37567.40 MW (hydropower) was generated in India (CEA, 2010). Paucity of water in rivers has reduced hydropower generation. The mushroom growth of thermal power plants have increased CO₂ level and affected energy security. The commercial energy consumption in India is less in comparison to other countries. It had risen from 1965 by 9% whereas it was 19.4% in 2000 (Tata Energy Research Institute report, 2000). In the process of great acceleration there shall be diminishing supply of fossil fuels which should exacerbate production and use of biofuels. Energy demand is higher than the production, and crisis will be more in India in the Anthropocene (Fig 10)

Erratic monsoon, demographic growth, urbanization and industrialization could not satiate growing demand of water and augment water stress. Erratic SW-monsoon shall bring more floods in Sept whereas longer dry spell in the month of May shall affect the fresh water availability from peninsular rivers. Drinking water shall be so precious that apprehension of third world war may be due to water.

Synthetic Life:-

Recent advances in molecular and genetic researches could develop artificial genome; bacterial chromosomes which can replace DNA in a bacterium producing new protein sets which can bring revolution in genetic engineering as part of the great acceleration where life span shall be multifold, Venter J. C. 2010^[52]. Now the Institute of Genomics and Integrative Biology can produce genomes. The age of synthetic life has started in India.

Health hazards:-

Major health impact due to climatic disgrace, population growth and anthropogenic activities shall enhance pediatric mortality, Vector borne diseases (especially due to mosquitoes), Hearts and lungs diseases, infectious and non-communicable diseases Vaughan et al (2016)^[53]. The endemic, outbreaks and epidemics throughout the land and ocean based wildlife have become unwarranted due to disruption of natural ecosystem. Pests, Vector diseases and immunity based diseases have aggravated both among the humans and the wild life. The contaminated water and stagnated urban floods shall exacerbate diarrheal diseases but effective management shall reduce the DALYs rate Singh et al 2012^[54]. Some new genera of malicious vectors and microorganisms have come up in the epoch which shall cause unnatural deaths and many species will be endangered or extinct. Use of hormones for early high yielding grains, vegetables and meat shall make the human based Anthropocene to be apocalyptic. Revkin Andrew, (2011)^[55] told that a type of Cyanobacteria had put an end to life and species 2 billion years BP in past.

Socio-economic-political:-

Socio economic conflicts, poverty, segmented demography have forced the Indians to a continuous brain drain to western countries since 1980's. Regional cooperation on interstate and intercontinental disputes with raised demand for water have started from 1970-1980. Some crucial turns have resulted in man-made political and economic issues. Global trade policies are making the poor to be poorer. There shall be 0.2 to 2% loss to annual global income on 2°C rise in temperature. But higher increase can bring calamity IPCC WR II, AR-5, (2014).

Migration, education and skill:-

India is switching from agro-base society focused on production to a consumerist society. The impact of migration, education and skill has brought us the social mobility, both linear vertical and spatial. Migration changes life style,

GDP and the emission. The migration from rural to urban areas has been studied and the rate of migration was 314.5 million as per 2001 Census in India in quest of education and skill development which is a very high figure.

Gender based changes:-

The women in India have less resource to cope and adapt with the climate and biologic reasons than men. They are deprived, poor and unequal which undermines their social and capital stand in the orthodox family in India. There is increase in gender based violence where women are the worst vulnerable. The unprivileged women are more in rural settlements than in urban. The gender ratio in India in last few decades may be one of the reasons for decline of population.

Gross Domestic Product:-

Global energy-related changes, CO₂ emissions and the influencing factors for climate changes as per KAYA identity (1971 to 2009) are at 79% population growth increase in per capita GDP and energy emissions are 106% and 105% respectively. Increase of GDP of India (Fig 11) from year 1985-86 with higher increase in emissions of CO₂, establishes the fact that the Anthropocene is in vogue in India. (Source: IEA loc.cit.http://www.feasta.org/wp-content/uploads/2013/02/Economic_growth_Population_growth.pdf)

Fig 11:- GDP growth of developing country India for the period 1950-2013 and 1986 is year of increase

Increased GDP growth (Fig 12) and retardation of rural settlement shall increase urbanization and industrialization which shall augment GHG's emission. Gross domestic product in India and its nominal values and purchasing power parity have been studied and the base year for calculation of purchasing power was considered to be the year 2000 which is the point of inflection of the curve Fig 11.

Fig 12:- The time series and moving average curves for GDP growth of India (1951-2013),

Geologic Evidences:-

Instantaneous causalities and fatalities only occur due to earthquakes, tsunamis, landslides and volcanic activities. First 2 decades of 21st century have signaled that the living kingdom have to pay huge losses due to geological extremes. India is safe towards volcanic activities as there is only one active volcano in Andaman Islands. But the impact of earth quakes, tsunamis, limnology, and lithology changes are common in Indian subcontinent.

Limnology:-

Limnology changes have disturbed the fauna and flora of water bodies, reservoirs, lakes, back waters and lagoons other than bay of Bengal and Arabian sea of India in post-Holocene, pre-Anthropocene and even during the great acceleration period. The physico-chemical parameters, rising of bed, squeeze of flood plains of rivers and sedimentation, reduced stratification and downsizing by volume of lakes/lagoons are observed. Dal lake Kashmir, Pichola lake Udaipur, Vena Lake Mahabaleswar, Koleru Lake (Andhra Pradesh), Chilika and Pulikat Lagoons were affected during the great acceleration of the Anthropocene. Construction of dams, barrages and weirs during the period of Anthropocene have retained the sediment at back and the deltas of India are in a state of sinking, shrinking and subsidence (Sivesky et al, 2009^[56], Gupta et al 2012^[57], Mishra S P, 2016^[58]).

Lithology:-

Out of 5200 types of minerals, (International Mineralogical Association), 208 minerals are of human origin formed due to great oxidation events in dump yards of mining area, smelter plant's inner walls, weathered slags, mine fire zone, walls of tunnels and debris of plastic wastes. Artificial stones, wastes from building demolitions, industrial scarps, cinder blocks and toxic radioactive byproducts have formed layers and shall be the lithological imprints of future as Anthropocene minerals. Plastic debris and trashes on beaches resulting from human activity and Tsunami activity shall form with sediment, fragments of basaltic lava and organic wastes/ shells to form a new rock. Clastic plastiglomerate which will remain as a stratum and can be a future earth's rock record, as a geographic mark.

Sea water intrusion due to decreasing inland flow has altered salinities in the deltas/estuary soils. The elite, chlorite, and Na⁺ contained montmorillonite soil have increased and Ca⁺⁺ Na⁺ mixed montmorillonite soil has decreased. Na⁺ mixed montmorillonite is major soil in swamps and elite in lagoons/ backwaters of the soil in east coast of India is major paleo changes during Anthropocene.

Seismicity and Tsunamis:-

The number of earthquakes of magnitude >7 in Richter scale has occurred in the 21st century till 10th Feb 2017 in the globe. The major earth quakes that had caused heavy fatalities and casualties in 19th, 20th and 21st century were of magnitude >7.0 in Richter scale. India was under the attack of the tsunamis from mid of 17th century in record. The intense upsurges recorded were 12m and 10m in case of Makran Tsunami 27th Nov 1945 and Sumatra tsunami 26th Dec 2004. The seismicity can alter an age or epoch because of its devastating impact as told by geologists in great dying period 200-250my BP. The extreme events during Anthropocene are in Table 2.

Table 2:- The changes and extreme events in different stages of the Anthropocene epoch in Indian Subcontinent

Decade	Changes / extreme events	Deaths/casualties	Losses	Remarks
2000-3000 BP	increased rainfall, cooler & humid climates, the beech forests	The civilization collapsed	Decline of Harappa /Mohenjo-Daro age	
1700-1850 AD				
1769-70 AD	Great Bengal Famine	10 million	Loss indigo plants for dye and opium	Manmade(Wiki pedia)
1783-84	Chalisa famine	11 million	poppies destroyed	
1791-92	Dojibara famine	11 million		
1819	Gujarat Earthquake	0.02 million		
1837-38	Agra Famine	0.8 million		
1851-1945 AD				
1860-61	Upper Doab famine	2.0 million	I Punjab/ Rajputana	https://en.wikipedia.org/wiki/Timeline_of_major_famines_
1865-67	Orissa famine	1 million	Bihar; Bellary and Ganjam	
1868-70	Rajputana famine	1.5 millions		
1881-90	Odisha famine	1.5 million		
1896-97	Indian famine	5.0 millions	Richter Scale 8.3	In British territory
1897(12 th June)	Assam earthquake	0.0015 millions		
1899-1900	Indian famine	>1.0millions		
1905 (4 th April)	Kangra earth quake	0.0019millions	Richter Scale 7.5	In British territory
1951-1980 AD				
1961-70	1970 Bhola cyclone	0.5million	\$86.4 million (1970)	Bangladesh
1971-80	Cyclone Andhra, India, 1977	10,000 people	40,000 cattle deaths	
1980-2017	The great Acceleration			
1984,19 th Oct	Bhopal Gas tragedy	20000 deaths	5lakhs affected	

1993 (29 th Sept) 1998	Latur Earthquake 1993 Super cyclone Odisha, India 1999, Heat waves	7,928 people died 0.002millions 0.0013millions	30,000 injured Max mercury reached 45 to 50 ^o C	Prominent, El Niño Transition (ENSO), 1998
2001 (26 th Jan) 2004 (26 th Dec) 2005 (24 th July) 2005 (8 th Oct) 2010 2010 2010 2010	Bhuj, Earth quake, India(M 7.6) Great Sumatra earthquake and Tsunami (M9.3) Teressa Island, Andaman (M7.3) Kashmir earthquake (Pak/ India) Asian Monsoon displaced west The snow retreat and recorded snow melt reduced Cancer death (age 30-69)	20000 deaths 280000 deaths Least deaths Well adminstered 74661 deaths 138,366 people 15,000 people 1600people 5,56,400 people	0.63million affected 10m high surges, land form distorted No reported trauma snow area by 4.9million sqkm	intra-plate area Prominent, El Niño to La Niña Transition (ENSO), heavy rainfall R. Prasad, http:// www.thehindu.com/s ci-tech/health
2011-17	Uttarakhand/ H.P., Rain/ Flood India 2013 Hiayan typhoon, Philippines,2013 But Phailin storm India, 2013	4094 people 10,000 dead but 21people(only).	> 9 million affected >9million affected	

PHA's and NEO's:-

According to NASA, exo-planet Alien asteroids of smaller size (<25m) get burnt in the Earth's hemisphere and cause inconspicuous damage. Meteors of size (>25m) slam earth at a frequency of 2,000 years or so and damaged an extensive area significantly. Asteroids of very large size are hostile to mass extinction and earths civilization (https://www.nasa.gov/mission_pages/asteroids/overview/fastfacts.html). The impact and the potential effects of potentially hazardous asteroids (PHAs) or near earth objects (NEOs) are location specific and caused damages depending upon angle of hit, velocity of slamming and the size of the alien Table 3.

The Permian-Triassic asteroid in 200-250 million years BP and the Hephaistos or SL9 of 65-66 million years BP are responsible for the mass extinction during transit period of Permian–Triassic (P-Tr) eon and Cretaceous and Tertiary (K-T) era and believed to end the Permian period and cretaceous period by destructing 90% of species and delaying the process of evolution by millions of years.

Table 3:-List of exo-planet Alien, PHAs and NEO pre Anthropocene and post Anthropocene disasters

Major alien asteroids slammed earth before 2016					
Year	Place of strike	Boundary of era	size	Effect	
200-250 my BP (great dying)	Controversy,	Paleozoic to Mesozoic Era, Triassic (P– Tr) extinction event (fullerenes/buckyballs)	9Km(Global warming, 90% mass extinct 70% -terrestrial vertebrate	G. Jeffrey Taylor, http://www.psrdr. hawaii.edu/Feb01/perm ianImpact.html
65-66 my BP	Yucatan Peninsula, Chicxulub crater, Mexico	Cretaceous–Paleocene extinction event. (Hephaistos or SL9)	10Km	Global warming, dinosaurs large Extinct	https://www.psi.edu/ep o/ktimpact/ ktimpact. html
3.3 my BP	Argentina	Cretaceous-Tertiary (KT) extinction	37–58 km	extinctions/ global cooling trend	
50000years BP	Arizona (N)	Pleistocene 180 m deep, 1.2 km diameter bowl- shaped depression	30m	impact of a 100,000-ton iron- nickel meteorite	https://astrogeology.usg s.gov/facilities/meteor
1490AD	Chiling- yang(China)	Huge number of meteorites of stones. covered 4-5 cities of China	Scatte red stones	10000 people death	http://articles.adsabs.har vard.edu/full/1994Meti c..29..864Y/0000867.00 0.html
1908	Tunguska, Siberia, Exploded 10km above ground	Breaking up of large meteorite (NEO), 50m, 2150 km ² ruin		releasing energy in the atmosphere 10- 15 megatons	http://news.nationalgeo graphic.com/news/2007 /11/071107-russia-

Major anthropogenic fatalities due to population explosion are accidents, stampedes, wars, Naxalite activities and many such. Those major fatalities were absent during Holocene epoch in India.

Present and future impacts of Anthropocene epoch in India:-

Present globe is influenced by human agents overriding the catastrophic nature and extremes of sun earth geometry. If present trend continues, 75% species will become extinct in the next few centuries on the earth Vaughan (2016)^[53]. The new age Anthropocene is still under debate as to whether it is a part of Holocene or a new one.

Melting of ice in Himalayas due to high temperature shall increase summer flow in perennial northern rivers like Sindh, Ganges and Brahmaputra and many others. Flash flood in Kedarnath (2013) was due to over topping of Chourabari lake killed 5700 people. The 427dams proposed to be constructed in Himalayas may extinct the species, increase more landslides and flash floods in Siwalik range and lower Himalayas.

Outbreak of vector, immune deficiency diseases, effect of pests and water borne diseases shall increase during Anthropocene (Ex: malaria, kala-azar, dengue and chikungunya Japanese encephalitis etc.. Some deadly diseases of Holocene epoch shall be completely eradicated in India. The disability-adjusted life year (DALY) is the years lost due to disability, ill-health, or early death shall reduce in comparison to the globe by 46.6%, Singh et al (2012)^[54]. Smoking, drugs, and alcohol shall certainly add to the DALY rate.

High yield of low paddy due to improved genetic advancement and less production rate of wheat is highly risked. The insufficiency in agricultural yield, milk and protein foods due to increased demography shall have negative impact on human health leading to malnutrition, if not addressed in time. Medication for premature growth shall be apocalyptic.

Biodiversity impacts: A large number of invasive species creep into the water bodies, lagoons and marine system causing myriad impacts on human health. Marine water snails devastate the vegetation in the coast and transmit schistosomiasis, vectors proliferate diarrheal diseases. Coastal erosion and low lying area inundation likely to affect poor people by *Anopheles sundaicus* (Diptera: Culicidae). A brackish water breeder mosquito vector of malaria shall widespread which was confined in Andaman and Nicobar Island only. MSL rise shall affect most the 7500km of Indian coast line which has started from 2004 from the east coast. Amphibians are becoming extinct and there shall be global homogenization of flora and fauna. Mammals extinct by 21st century in India are Mammals Asiatic cheetah: Extinct from India (*Acinonyx jubatus venaticus*), Shanghai, Namdapha flying squirrel (*Biswamoyopterus biswasi*), Himalayan wolf ("*Canis himalayensis*"), Elvira rat (*Cremnomys elvira*), Andaman shrew (*Crocodyra andamanensis*), Jenkins' shrew (*Crocodyra jenkinsi*) and Nicobar shrew (*Crocodyra nicobarica*).

India's flora, Fauna, avifauna and aqua-fauna: Beautiful Indian birds, either extinct or endangered species in Anthropocene era are Great Indian Bustard (India), Red Headed Vulture, Spoon Billed Sandpiper, Jerdon's Courser, Bengal Florican, White Bellied Heron, Sociable Lapwing and many others. There is also a long list of endangered species of flora, fauna, avifauna and aqua fauna in India today.

Many tribes (Homo-sapiens) in India and also in the globe are Rabari of Gujarat, Andamanies in Andaman and Nicobar islands, Nenets in Russia, Kalash in Pakistan, Batak in Philippines, Maori in New Zealand, El Molo in Kenya, Dukha in Mongolia, Goroka in Indonesia and Papua New Guinea, Piraha in Brazil and many other tribes are facing extinction.

The life of the epoch "The Anthropocene" :-

Life on our mother Earth evolved about 4 billion years BP, due to chemical action of air, water and various rocks Hazen (2006)^[60]. According to reports of NASA, three PHAS and NEOS, 2016WF9, 2015BN509 and 2017BS32 are estimated to strike earth in near future which can cause mass devastation. Boffins at the US space agency, the steroid Asteroids with lower-inclination orbits are easy for reach and likely to hit earth. (<http://www.dailymail.co.uk/sciencetech/article-2145699/New-Nasa-sky-scan-reveals>). A ~ 11-25m asteroid (2017 BS32) will burn up during its entry to our atmosphere and the other two shall have less impact. Very large number of PHA's and NEO's are on line for collision process with the earth system – but the epoch Anthropocene shall safely dominate for the next 1.35million years till collision of Gliese 710 or so Bersky et al, (2016)^[59]. But the scientists have planned to bombard and explode the earth hitting PHA's and NEO's before collision and keep the earth from the apocalyptic.

Andrew Revkin, (2011)^[55] reported that a type of unknown killer cyanobacteria oxygenated the atmosphere and extinct most of the species and can put an end to the biodiversity 2 billion years ago.

Management of Anthropocene epoch:-

Geologists and anthropologists have accepted about the fifth extinct in the globe. The sixth extinction of India and the globe is foreseen. Influences of the acceleration of climatic changes in the Anthropocene have adversely affected the underprivileged but they can have chances of survival with non-genocidal activities. The causes for main extinction are the concrete and fertilizers (adding enormous P and N to soil), sinking and shrinking of the deltas (dams and hydrologic interventions), Biomedicines (Nano-tubes and dechronification) and many others. The result of these human activities have increased the GHGs, temperature, NEOs and PHAs, meteorological extreme events etc. Some scientists have notion that the rate of extinction of species would have been much more and the modern Homosapiens would have vanished. The adverse effects of Anthropocene can be ameliorated and the extinction of species, delayed by application of modern science and technology developed.

The **geo-engineering approach** is to cool the climate and save the hot earth from GHG gas emissions by adding artificial aerosols in the stratosphere. To keep it safe from anthropogenic, forest fire, dust storms and drought actions are being taken by artificial heavy precipitations. The aerosol preferred to be efficient is the sulphate formation in the stratosphere Cruzen 2008. But the sulfate particles near earth surface are fatal and can make acid rain. The sulphur dioxide action cause death to a tune of 0.5 million annually, preventive actions are under consideration as per WMO report.

The carbon emission can be reduced by imposing heavy taxes on the countries who cannot maintain its carbon level in the developing countries in the world (as per The Kyoto Protocol, Canada, 2011). Ships and cargoes add a lot to the atmospheric carbon and sulphur pollutions from both coal and diesel engine. <http://nce. Habitats even. Work /2014/india/>. The CO₂ and energy management in India needs to be done in domestic, Industrial, Transportation, and agricultural sectors. Air pollution in India can be reduced by proactive measures projected reducing mortality rate due to reduction of PM5 and PM2.5 particulates

Hydro-meteorological extreme events: In November 2013, Haiyan, a typhoon slammed and ransacked Philippines coast causing death to 10,000 people and about 9 million became homeless. Prior another VSCS, Phailine and Hudhud, generated in east Andaman sea, in 12th Oct, 2013 and 2014 though not caused huge fatalities but devastated the Coromondol coast of India. Well preparedness and management of the cyclones were done the best and human loss was less in comparison to super cyclone at Para dip 1998 Fig 3(a).

Nano medicine: To combat human destruction and biologically process of ageing, the advances in nanotechnology, cloning and biotechnology have acted well. The Nano-medicines, with well-defined Nano-scale molecular structures, nanotubes, dendrimer-based organic devices and biologically active materials based on fullerenes can rejuvenate and slow down human ageing process. Knowledge of proteomics and genomics shall bring a revolution in medicine. Repair of damaged tissues by stem cell treatments, and biological robots created from bacteria and motile cells can deliver measured aging.

De-chronification: To continuously arrest and deplete biological ageing of human's application of intracellular respirocyte and microbivores in live cells, use of chromosome replacement therapy and repair of continuous cell damages can be done through Nano medical advances. The processes can be removal of toxins from cells, chromosome substitution therapy and cellular repair devices. It can even increase longevity from present 90 years to even 5400 years by de-chronification Freitas Jr.(1999)

From geological and hydro-metrological to biological: Mutagenic, carcinogenic or toxic microbes to reproduction shall be dominant in this epoch. The change from Holocene is not only anthropogenic but also mainly geological and hydro-metrological to biological.

The carbon pool and carbon budget: Tree cover makes major input to carbon pools on farm lands. The carbon pool adds to climatic variation mitigation and adaptation. Two third of fossil fuel is left to human which controls the carbon of the atmosphere. If from today planning, regulating the extraction, distribution and efficient use of coal, oil, electricity and atomic energy with use of maximum renewable energy not managed properly then the ambient temperature within 2^o C rise cannot be maintained, then the process of ageing of the Anthropocene shall be faster.

Conclusion:-

On stratigraphic study of recent lithology, mineralogy and limnology, the signatures of the epoch The Anthropocene during the great acceleration are found to be anthropogenic, chemo-stratigraphic, paleontological, changes in limnology and lithology, genomic and Geo-centric.

India is in the race of sixth extinction. Multi-level and polycentric efficient governance of vulnerable climatic anomalies can ameliorate and delay the effect of the great acceleration. Efficient policy makers; basin and other line managers, political leaders, economists and the teachers should stress upon effective adaptation and management which can provide better results to address the uncertainty and complexity of the epoch

Note: This paper is a prologue to the breakthrough dialogue on the Anthropocene at Cavallo point, Sausalito, California from 21st June to 23rd June, 2017.

Acknowledgement: I regard the inspiration and suggestions given by my beloved teachers Prof. Dr. Joy Krishna Dash during preparation of the manuscript.

Abstract

Green synthesis is a promising nanotechnological tool for biomedical application. The present investigation demonstrates a rapid biogenic approach for the synthesis of gold and silver nanoparticles using biologically active and medicinal important *Ziziphus nummularia* leaf extract as a reducing and stabilizing agent under ambient conditions. To our knowledge, this is the first report where *Ziziphus nummularia* leaf extract was found to be an appropriate plant source for the green synthesis. The presence of various phytochemicals viz. polyphenols, alkaloids and flavonoids, were investigated by following standard biochemical methods. The silver and gold nanoparticles were characterized by UV-visible spectroscopy (Systonic 2203) that showed Surface Plasmon Resonance (SPR) for both gold and silver nanoparticles at 551 and 438 nm. Scanning electron microscopy (SEM) revealed that gold nanoparticles were observed as nanorods in shape with 54 nm in size while the size of the silver nanoparticles was measured 200 nm with spherical shape. The antioxidant activity was determined by 2, 2- diphenylpicrylhydrazyl (DPPH) assay. Further, the antibacterial activity of synthesized silver and gold nanoparticles showed effective inhibitory activity against *Staphylococcus aureus* and *Sstrectococcus mutans*.

Introduction:-

Nanoscience and nanotechnology has the capability to provide the most dynamic area of research in modern materials science (P.P Singh & C. Bhakat 2012). Nanoparticles are exceptional materials with exclusive features and electifying applications in diverse fields (R Geethalakshmi and DVL Sarada 2012). Metal nanoparticles, such as those containing silver (AgNp) and gold (AuNp) hold enormous application in different fields like medicine, electronics, energy saving, environment, textile, cosmetics due to their unique optical, electrical, and photothermal properties (C. Ramteke *et al.* 2013). The most important properties of silver nanoparticles are its antibacterial, antifungal and antimicrobial effects (A. Singh *et al.* 2010) while gold nanoparticles show optical and catalytic property in chemical reaction (Michael Quinten 2011). They also have strong surface plasmon resonance oscillations (L. Rivas 2001). The synthesis of nanoparticles is very quiet novel process leading to truly green chemistry in plants which supply advancement over chemical and physical method (A. Gole *et al.* 2001). As it is cost efficient and environment friendly easily scaled up for large scale synthesis and in this method there is no need to high pressure, temperature and toxic chemicals (D. Ashok Kumar. 2012). Conventionally, nanomaterials are

synthesized by chemical or physical methods; Green synthesis of nanoparticles is the most promising method of synthesis (A. Leela & M. Vivekanand. 2008).

Dental caries is a chronic and infectious disease characterized by demineralization of the tooth due to acids formed by bacteria in biofilms produced on its surface. *Streptococcus mutans* is considered one of the most cariogenic microorganisms present in human dental biofilm (M.R. Linares *et al.* 2014). The cariogenicity of these bacteria is based on the metabolism of sucrose, which are a substrate for membrane-bound glucosyl transferases and a proficient growth substrate for *S. mutans* (V. A. Lee *et al.* 2010) (W. I. Loesche *et al.* 1986). The earlier approach to the treatment of using hand excavation was a painful and ineffective process of carries removal (A. Juntavee *et al.* 2014).

Medicinal plants play a key role in the innovation of new therapeutic agents for drug development (Elavazhgan T. Arunachalam KD 2011). *Zizyphus nummularia* belongs to the family Rhamnaceae. It is a shrub or thorny small bush or small tree with medicinal properties (M. Goyal *et al.* 2012). It is commonly known as wild jujube (English) and jharberi (Hindi). *Zizyphus nummularia* grows in great quantity in the arid and semi-arid areas of India. Especially in Rajasthan it forms 14% of the whole composition of the grassland flora (A. H. Shah *et al.* 1990). The local communities used *Zizyphus nummularia* as analgesic, anti-inflammatory, anti-colds and anti-coughs medicine (M. Goyal *et al.* 2011) and also contain numerous bioactive phytochemical materials such as polyphenols, flavonoids, pectin, saponins and alkaloids (A. F. Morel *et al.* 2009) (M. Lalitha Eswari *et al.* 2013). The leaves of *Zizyphus nummularia* have been reported to possess strong antioxidant properties (Salma Nasrullah Malik. 2015) and have also been used to treat diabetes and chronic fever in India. Fruits and roots of *Z. nummularia* are used to cure sun stroke and healing cuts. This plant is also used for removing stones (A. H. Shah *et al.* 1990) (S. Chandra *et al.* 2011).

To our knowledge, this is the first report where *Zizyphus nummularia* leaf extract was found to be an appropriate plant source for the green synthesis of silver and gold nanoparticle (D. Ashok Kumar 2012). Bioreduction of chloroauric acid (HauCl) and silver nitrate (AgNO₃) for the synthesis of silver and gold nanoparticles correspondingly with the plant extract, *Zizyphus nummularia* (Rhamnaceae) (D. Mubarak Ali *et al.* 2011). The rapid development of stable silver and gold nanoparticles is observed (S. S. Shankar *et al.* 2004). However, no studies have examined the antibacterial potential of nanoparticles using leaf extract of *Zizyphus nummularia* in an infected dentin model. The purpose of this in vitro study was to evaluate the antibacterial activity of Silver and Gold Nanoparticles against *S. mutans* and to find its efficacy as an intracanal medicament (R. Suvarna *et al.* 2014) (D. R. Herrera 2016)

Methodology:-

❖ Materials and Sample Collection:-

All chemical reagents including chloroauric acid (HAuCl₄), silver nitrate (AgNO₃) 0.135mM DPPH solution, Folin-Ciocalteu's phenol reagent, methanol and gallic acid (CDH, Central Drug House, New Delhi) were obtained and used as received. Muller Hinton agar (MHA) from obtained from (Hi-Media Pvt. Ltd. Mumbai). All the chemicals used were of the highest purity available. Ultrapure water was used for every experiment (Milli-Q System; Millipore Corp.). Fresh *Z. nummularia* leaves collected from the Maharaj Vinayak Global University, (Jaipur, Rajasthan India) were used as a plant source.

❖ Preparation of Plant Extract:-

20 gm of fresh leaves of *Z. nummularia* were washed thoroughly with double-distilled water and were then cut into small pieces. These finely cut pieces were then mixed with 100 ml double-distilled water and this mixture was kept for boiling about 20 minutes. After cooling, it was filtered through Whatman Filter paper. 1 and further use for biosynthesis of silver and gold nanoparticles.

❖ Synthesis of Silver Nanoparticles:-

10 ml aqueous extract of *Z. nummularia* leaves was added to 90 ml of silver nitrate solution (1mM). The solution was allowed to react at room temperature and after 30 minutes change in the color was observed (colorless to intense yellow).

❖ Synthesis of Gold Nanoparticles:-

5 ml aqueous extract of *Z. nummularia* leaves was added to 5 ml of chloroauric acid solution (1mM). This solution mixture was exposed to room temperature for 2 hour. Dark brown color was observed then analyzes the peak value of these particles with the help of UV Vis Spectrophotometer.

Fig. 1:- Schematic representation for synthesis Ag & AuNPs

❖ Characterization of Synthesized Nanoparticles:-

Ag and AuNPs obtained from *Z. nummularia* were characterized by recording UV-Vis absorption spectra using Double Beam UV-visible spectrophotometer 2203 through a quartz cell with 10 mm optical path that demonstrated peak value. The samples were packed in a quartz cuvet of 1 cm light- path length and the light absorption spectra were given in reference to deionized water.

The morphology of the colloidal sample was examined using Scanning electron microscopy (SEM-Zeiss) and Transmission electron microscopy (TEM-FEI Tecnai G2 S-Twin) with ultrahigh resolution (UHR) pole piece operating at an accelerating voltage of 300kV that revealed size and shape.

❖ Extraction of antioxidant:-

The leaves of *Ziziphus* were cleaned and cut into small pieces and then oven dried at 50°C for 72 hour. The dried sample was pulverized by a mechanical grinder and passed through 250 µm mesh and then stored at 4°C until use. In the extraction process about 1 gm of *Ziziphus* powder were weighed in universal bottles and 10 ml of 50% methanol was added. Then solution was homogenized using homogenizer at 24'000 rpm for 1 minute after that sample was centrifuged for 10 min. the supernatants were collected for further analysis.

❖ Radical DPPH Scavenging Activity:-

Antioxidant activity of the *Ziziphus nummularia* extract and standard was measured on the basis of the radical scavenging effect of the stable DPPH free radical. The 2, 2 diphenyl- 1- picrylhydrazyl was dissolving in methanol to prepare the DPPH solution. The DPPH solution was dilute 42 times with methanol to obtain 0.9 absorbance at 516 nm with the help of spectrophotometer. 1 ml of DPPH solution was added into 100 µl of *Ziziphus* leaf extract solution. This mixture was shaken in vortex and kept in dark room for 2 hour. After that mixture was transferred to micro plate and absorption was measured in spectrophotometer. The following equation (3.1) calculates the percentage of DPPH scavenging activity: the percentage of DPPH scavenging activity was calculated using the following equation: Radical scavenging (%) = $[(A_0 - A_1) / A_0] \times 100$ where A_0 is the absorbance of the control and A_1 is the absorbance of the sample extracts (Salma Nasrullah Malik 2015) (S. Gupta *et al.* 2016).

❖ Phytochemical Screening:-

Total Flavonoid Content:

Plant extract (0.5 ml of 1:10mg/ml) in methanol were separately mixed with 0.1 ml of 10% aluminium chloride, 1.5ml of ethanol, 0.1 ml of 1M sodium acetate and 2.8 ml of distilled water. Solution was kept for 30 min at room

temperature and absorbance of the reaction mixture was measured by double beam UV spectrophotometer at 415 nm.

Total Phenolic Content:

The total phenolic content of *Ziziphus nummularia* extract was determined by using Folin- Ciocalteu method. Standard Gallic acid (10gm) was dissolve in 100 ml of distilled water in volumetric flask (100 µg/ml of stock solution). 1.5 ml of Folin- Ciocalteu reagent and 10 ml of distilled water, diluted according to the label specification to each of the volumetric flasks. After 5 min 4ml of 1M sodium carbonate was added and made up to 25 ml with distilled water. Simultaneously leaf extract (0.5 ml of 1:10 mg/ml) in methanol were separately mixed with above reagent. After 30 minutes absorbance at 765 nm was observed.

Total Alkaloid Content:

5 gm sample of *Z. nummularia* was weighed into 250 ml and 200 ml of 10% acetic acid in methanol was added and kept for 48 hours. After filtration the extract were concentrated on a waterbath. Concentrated ammonium hydroxide was added drop by drop into the extract until the precipitation was complete. After that solution was washed with dilute ammonium hydroxide and filtered. The filtrate obtained was dried and weighed.

❖ In Vitro Study On Infected Dentine:-

Firstly infected tooth (Incisor, Premolar & Molar) collected from Maharaj Vinayak Global University in the department of Conservative and Endodontics. Healthy and infected tooth dipped into nanoparticles solution synthesized from *Ziziphus nummularia*. pH of solution should be maintained at 5.5. Nanoparticle solution kept in B.O.D. incubator (37° C) for overnight incubation. After overnight incubation results was observed.

Results:-

Silver and gold nanoparticles were synthesized using leaf extract of *Ziziphus nummularia*. Due to the reaction of the metal salt, color of the solutions changed colorless to yellow and dark brown, indicating the formation of silver and gold nanoparticles, respectively.

❖ UV Visible Spectroscopy:-

Reduction of silver ions into silver nanoparticles using leaf extracts *Z. nummularia* was proved by the change of color from colorless to intense yellow. The UV- Visible spectra show an absorption band at 438 nm indicating the presence of silver nanoparticles.

For gold nanoparticles, bioreduction of Au ions was observed by visualizing the color change from colorless to dark brown. UV- Visible spectra confirmed the presence of gold nanoparticles with absorption band at 551 nm.

❖ SEM Results:-

The scanning electron microscopy (SEM-Zeiss) has been engaged to characterization the size, shape and morphologies of formed silver and gold nanoparticles. From the images (**Fig. 2**) it is evident that the morphology of AgNP is nearly spherical and AuNP is indicating niddle shaped rod. The average particle size examined with the help of SEM images is observed to be 200 nm of silver nanoparticles while 54 nm of gold nanoparticle.

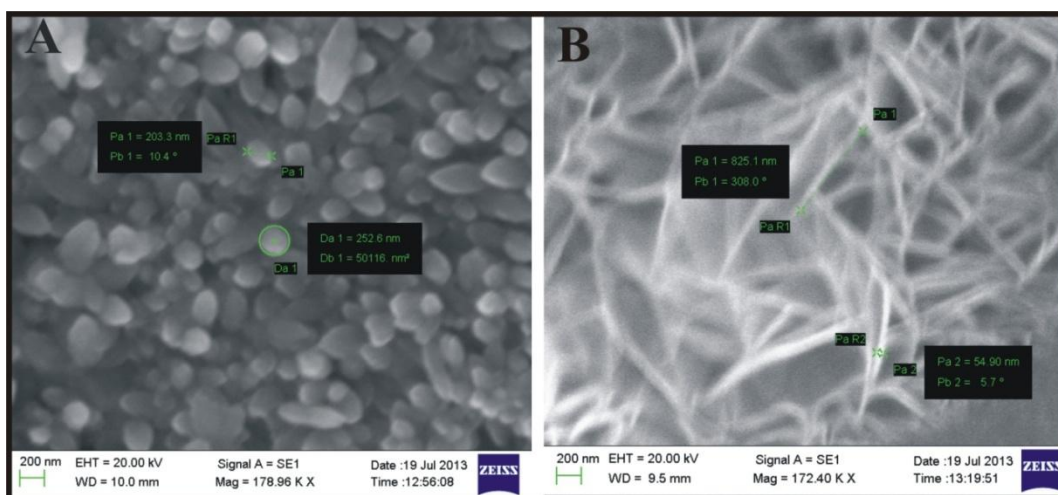

Fig. 2:- SEM Images of (A) Silver nanoparticles and (B) Gold Nanoparticles

❖ TEM Results:-

HR- TEM micrograph was examined the morphology of silver and gold nanoparticles. The data obtained from TEM images found distinct shape and size of polydisperse nanoparticles. These images suggest that the gold particles are niddle shaped rod and silver nanoparticles are mostly spherical in shape. It is evident that the size distribution of gold NPs between 50-60 nm and 200 nm for the silver NPs. The spherical and niddle shaped rod of the particle, as visible in **Figure 3**, is due to the fact that when a particle is produced, in its initial state, it tries to obtain a shape that corresponds to minimum potential energy.

Fig. 3:- TEM Images of (A) Silver nanoparticles and (B) Gold Nanoparticles

❖ Antibacterial activity:-

The agar diffusion method was used to notice the effect of the concentrations of both silver and gold against *Streptococcus mutans* (MTCC 1890) & *Staphylococcus aureus* (MTCC 7443) bacteria. The in vitro antibacterial activity of the samples was evaluated by using Mueller–Hinton Agar (MHA). The results as shown that *Streptococcus mutans* & *Staphylococcus aureus* were susceptible to the gold and silver nanoparticle both (**Fig. 4**). The zones of inhibition created by the gold & silver particles of the *Ziziphus nummularia* compared favorably with control in this study. The activities of gold and silver nanoparticles against *S. mutans* & *S. aureus* suggested that these particles could be used to treat dental carries

❖ **DPPH Assay (Radical Scavenging Activity):-**

A huge number of methods have been developed to estimate antioxidant capacity of medicinal herbs extracts. But only some of them used widely due to the complexity of measuring total antioxidant capacity owing to limitations associated with methodological issues. DPPH radical scavenging activity assay is performed to monitor the ability of compound to act as free radical scavengers and to analyze the antioxidant activity of plant extract. The methanol extracts of *Ziziphus* leaves sample was calculated for their IC₅₀ values against DPPH. IC₅₀ is the required concentration of *Ziziphus nummularia* antioxidants to scavenge 50% DPPH radicals in the reaction mixtures. Free radical scavenging property was calculated. The antioxidant activity of *Ziziphus* leaves is illustrated in Table Figure (1 and 5). These data indicated that the *Ziziphus nummularia* extract is kinetically active scavenger against DPPH under the testing conditions.

Table 1: - DPPH Free radical scavenging activity of *Ziziphus Nummularia*

Sample	Concentration (mg/mL)	% Inhibition	IC50
<i>Ziziphus nummularia</i>	0.023	31.91	0.03832
	0.046	60.48	
	0.069	84.41	
Control Absorbance = 0.00184			

Fig. 5:- Graphical representation of DPPH scavenging activity of *Ziziphus nummularia*

❖ Phytochemical Screening:-

Phytochemicals component in the plants are identified to be biologically active complexes and accountable for various activities such as antibacterial, antimicrobial, anti inflammatory and antioxidant. In the present study, the phytochemical screening of *Ziziphus nummularia* leaf extract had been performed with methanol extract and the results shown in **Table 2** respectively. It revealed the presence of alkaloid, flavonoid and phenolic compound present in the extracts.

The total phenolic content was found to be 1.37% while total flavonoid content was found to be 0.066% in methanol extract. Total alkaloid content was found to be 4.04% in plant powder.

Table 2: - Phytochemicals detected in *Ziziphus nummularia* Extract

Parameters	Results	Method
Extractive Value (Methanol Solvent)	12.01%	API Method 2008
Total Flavonoid Content (By UV spectroscopy)	0.066%	API Method 2008
Total Phenolic Content (By UV spectroscopy)	1.37%	API Method 2008
Total Alkaloid Content	4.04%	API Method 2008

❖ In Vitro Study on infected Dentine

Silver & gold nanoparticle extracted from *Z. nummularia* provides antibacterial activity against acid producing bacteria, *Streptococcus mutans*. Healthy and infected tooth dipped into nanoparticles solution (pH 5.5). Nanoparticle solution kept in B.O.D. incubator (37° C) for overnight incubation. Dentine starts dissolve after overnight incubation in AuNPs & AgNPs solution (pH 7) was observed. The use of these NPs in the treatment of dental caries was found to be very effective.

It is proved that this project is successful in reducing infected dentine further studies must be conducted to test the carcinogenic properties either in animal model or in cell lines in order to evaluate the application of AgNPs & AuNPs as a bactericidal agent.

Fig. 6:- Schematic representation of Ag & AuNPs Effect on Infected Dentine

Conclusion:-

The current method eludes the use of toxic chemicals for the synthesis of gold and silver nanoparticles so it can be used for biological applications. This research has successfully employed for the development of silver & gold nanoparticles with spherical & nanorod shapes by using *Ziziphus nummularia* as reducing and stabilizing agent. This synthesis approach of gold and silver nanoparticles is rapid, cost effective and can be widely used in biological systems & medical system. Nanoparticles have been extensively researched because of their unique physical properties, chemical reactivity and potential applications in biological labeling, biosensing, drug delivery, antibacterial, antimicrobial and antiviral activity, detection of genetic disorders, gene therapy, and DNA sequencing. According to the results, *Ziziphus* leaves contain alkaloid, flavonoid and phenolic compounds, it can be considered as an excellence source of antioxidant compounds.

Silver & gold nanoparticle extracted from *Z. nummularia* provides antibacterial activity against acid producing bacteria, *Streptococcus mutans* & *Staphylococcus aureus*. The use of these NPs in the treatment of dental caries was found to be very effective. This project is successful in reducing infected dentine further studies must be conducted to test the carcinogenic properties either in animal model or in cell lines in order to evaluate the application of AgNPs & AuNPs as a bactericidal agent.

Obesity, Prevalence, Preschool children, rural Cameroon.

Abstract

Background: Pediatric obesity is becoming a public health issue across several countries. Childhood obesity has immediate and long-term impacts on physical, social, and emotional health. Limited data concerning obesity among preschool children are available in rural Cameroon.

Aim: The aim of this study was to determine the prevalence and risk factors associated with overweight and obesity among rural nursery school children in Ngog-Mapubi Cameroon.

Material and Methods: This was a cross sectional study conducted in nursery school children aged between 2-5 years during the month of March 2016 at the public rural nursery school of Ngog-Mapubi Cameroon. Obesity and overweight were defined according WHO. Data were analyzed using Stata version 11. The Chi-square test was used to assess the association between respondent characteristics and the prevalence of overweight and obesity. Logistic regression was used for determination of risk factors of childhood overweight and obesity.

Results: Out of total 100 children recruited in this study, The overall prevalence of overweight is 40% (55.10% for boys and 25.49% for girls) while the overall prevalence of obesity is 13% (8.16% for boys and 17.64% for girls).

Conclusion: Finally, the cumulative prevalence of obesity is 53% in the studied population. Parent rentals and Child watches television after school were significantly associated to overweight while Parent rentals and Child eats snacks were significant predictor of obesity.

Introduction:-

Overweight and obesity among preschool children is becoming an emerging public health issue. It recognized that all their life, childhood obesity is associated with immediate and long-term impacts on psychological, physical, social, and emotional health troubles. Children with obesity are at higher risk for having other chronic health such as asthma, sleep apnea, bone and joint problems, type 2 diabetes, and risk factors for heart disease and diseases that impact physical health, [1, 2, 3-5]. Children with obesity are bullied and teased more than their normal weight peers, [6] and are more likely to suffer from social isolation, depression, and lower self-esteem. [7] In the long term, childhood obesity also is associated with having obesity as an adult, [8] which is linked to serious conditions and diseases such

as heart disease, type 2 diabetes, metabolic syndrome, and several types of cancer. ^[9-10] In developed countries, many reports, have shown increasing numbers of overweight children ^[11-13]. Developing countries are facing the double burden of under nutrition over nutrition and the extent of the problem remains unknown. Projections show that prevalence among children of less than 5 years) obesity will attend the magnitude of 12.7% in Africa by 2020 ^[14] In Cameroon, scarce childhood obesity data are available ^[15]. This study was carried out to estimate the prevalence of overweight and obesity among rural preschool children of 2 to 5 years

Materials and Methods:-

Ethics:-

The study was conducted during the month of March 2016 at the public rural nursery school of Ngomapubi Cameroon. Admission to the study was based solely on voluntary authorization of the parents or the guardians who provided their verbal informed consent. The study was approved by the Education Planning Commission of the hospital of Ngomapubi.

Subjects:-

Our cross sectional study was carried out on 100 healthy preschool aged children the aged between 2 and 5 years. Data were collected during the month of March 2016 by applying a standard questionnaire to the mothers, the fathers or guardians. The parents filled the questionnaire regarding age, sex, education and occupation of the parent, family size, family history of chronic diseases, eating habits of junked food.

For each child anthropometric measurement of weight, Height, health examination and blood pressure measurement. Height and weight measurements were taken for each subject using adequate methodology of Weiner and Lourie 1981 et al [16]. The height was measured in standing position using tape meter while the shoulder was in a normal position to the nearest. Body weight were determined in participants (with very light clothing on and without shoes) using a Jocca™ scale.

The blood pressure was measured by one nurse with Labell™ electronic blood pressure on the wrist. If one child was crying, the blood pressure was not taken until he or she became calm. The determined systolic and diastolic pressures were ascertained from three readings using the mean value of the three. Blood pressure was measured 3 times on the left arm and in the sitting position, with at least 10 min of rest before the first measurement and a two-minute interval between measurements, according standardized techniques.

Definition of Overweight and Obesity:-

Body mass index (BMI) was calculated as weight in kilograms divided by square of height in metres. International criteria for BMI percentiles for age and sex (Cole et al. 2000^[17]). BMI is a measure used to determine childhood overweight and obesity. Overweight is defined as a BMI at or above the 85th percentile and below the 95th percentile for children and teens of the same age and sex. Obesity is defined as a BMI at or above the 95th percentile for children and teens of the same age and sex.

Statistical Analysis:-

The survey sample was categorized according to age and gender, All data were analyzed by STATA version 13. The data were classified into four age groups, each of one-year duration, i.e., age group 2+ included children from age 2.00-2.99 years, the age group 3+ from 3.00-3.99 years and so on. Categorical variables are presented as percentages or numbers. The chi-square test respectively, P value <0.05 was considered statistically significant.

Logistic regression was performed with adjustment for all variables for identification of risk factors for overweight and obesity

Results:-

Of the 100 children, were (49%) were males and 51% females. Their age ranged from 2-5 years. Table 1 shows the distribution of the studied population according to age. Most of the girl assessed had 4 years while the majority of the boys had five years. Table 2 reports the prevalence of overweight among boys and girls, the highest prevalence of overweight was reported among boys of 5 years while the lowest was noted among girls of 5 years. They were a significant difference among overweight prevalence of boys and girls of 5 years.

Table 3 reports the prevalence of obesity among boys and girls, the highest prevalence of obesity was reported among girls of 3years while the lowest was noted among girls of 5years and boys of 3years. They were a significant difference among obesity prevalence of boys and girls of 3years.

Table 4 show factors associated with overweight. Parent rentals and Child watches television after school were significantly associated to overweight.

Table 5 show factors associated with obesity. Parent rentals and Child eats snacks were significant predictor of obesity.

According to table 4 and 5, boys exhibit higher significant prevalence of overweight but lower prevalence of obesity comparatively to girls. The overall prevalence of overweight is 40% (55.10% for boys and 25.49% for girls) while the overall prevalence of obesity is 13% (8.16% for boys and 17.64% for girls). Finally, the cumulative prevalence of obesity is 53% in the studied population.

Child eats snacks regularly	1.64(0.49-5.48)*

Discussion:-

Childhood obesity is becoming a worldwide serious public health problem. Obesity in childhood is tend to be maintained in adulthood with series of unhealthy events such as dyslipideamia, hypertension, type 2 diabetes, metabolic syndrome and psychosocial disorders. Obesity has reached pandemic proportion in Cameroon and to limit that pandemic, prevention of adult obesity induced morbidity and mortality should be trigger as early as possible in childhood. Scarce studies have been conducted on overweight and obesity prevalence and risk factors among preschool children in rural areas of Cameroon. This study was carried out to estimate the prevalence of overweight and obesity among rural preschool children aged between 2 and 5years old of Ngog Mapubi nursery school and to contribute to find effective ways to prevent childhood obesity.

The prevalence of overweight and obesity in our study is too high and does not favour comparison with others studies. This prevalence was higher than the previous Cameroonian (8.0%) study[15] and others sub-Saharan African studies done in Ivory Coast (4.4% in 2012), in Nigeria (6.3% in 2013), in Senegal (6.8% in 2013), and Democratic Republic of Congo (5.6% in 2014) [18]. Many reason can justified this great prevalence, the small sample size, the definition used, the age of participants and the socio-economic status.

In our study, prevalence of obesity varies with gender difference, it was noted that boys were more at risk of overweight while girls were more obese. This finding is consistent with many studies [19,20,21], but in contrast with reports with girl obesity predominance[22-26] and no gender difference noticed among boys and girls [27,28]. It is well known that overweight is a result of interactions between genetic and environmental factors, metabolism, eating and physical activity behaviour, and social and individual psychology[29-32] It has been found that parent rental is a risk factor of obesity, infact our study area is a rural area where only civil servant with high incomes are transferred for professional reasons and are obliged to rent houses because they are not in their native village. This is supported by the reports show that in developing countries, a positive association is noted has between obesity and children of high parents having a high socioeconomic status, [33].

Inactivity through watching television after school and eating snacks regularly are obesity risk factors in our study. Television influence the dietary behaviors of children and reduces their daily physical activity level and consuming more energy from snack with added sugars or solid fats than the body uses for healthy functioning, growth, and physical activity, leads to obesity. [34,35,36].

This study has some major limitations, the small sample size of population recruited only in Ngog Mapubi and it cross-sectional nature prevents it to be generalized in all rural preschool children.

Conclusion:-

These findings brings out the reality of child obesity among preschoolers in rural Cameroon and support the need for practical actions to be taken at the level of schools, parents and children to bar the way to obesity epidemic.

Acknowledgements:-

The author thank all the children who participated, their parents, teachers and the Head of the the nursery schools for their support their parents as well as the hospital personnel for the collection of the data.

Declaration of Conflicting Interest:-

The authors declare that there are no conflicts of interest.

Funding:-

This research received no specific grant from any funding agency in the public, commercial, or not for profit sectors.

Key words:-

Hepatic resection, low CVP, blood transfusion

Abstract

Background: Hepatic resection is a surgery which is associated with high risk of patient's morbidity and mortality. Thereby requiring expert skills on anaesthesia front. With the advancement in medical science there has been reduction in morbidity of patient. Starting from the assessment of the patient preoperatively for preexisting parenchymal liver disease going through the intra op period in which haemodynamic alterations can take a toll to the postoperative part, all are very crucial.

Aims: 1. To study the anaesthetic strategies during perioperative period.

2. To assess the postoperative recovery phase.

Methodology: This was a retrospective analysis of 10 patients with established liver disorders excluding patients with alcoholic hepatitis planned for hepatic resection in age range of 40-50yrs, under ASA grade 3. After induction of patient under epidural and general anaesthesia, haemodynamic parameters, blood loss, central venous pressure(CVP) were observed. CVP was kept ≤ 5 mmHg. Postoperative monitoring for vitals and complications was done.

Results: Out of the 10 patients, (Carcinoma GB, Hemangioma, Hydatid cyst). Two patients were not able to sustain low CVP, leading to acute transient renal failure in post operative period. Four (40%) patients needed blood transfusion. 20% patients had deranged coagulation profile which was managed by transfusion of fresh frozen plasma.

Conclusion: Improvement in surgical and anesthetic skills, use of risk reduction strategies, preoperative assessment, haemodynamic management can help in better patient outcome with reduction in mortality.

Background:-

Liver is a highly vascular organ with normal hepatic blood flow being 25% to 30% of the cardiac output. Liver has eight segments; each having its own blood supply by portal vein and hepatic artery. The segmental portal venous and hepatic arterial blood supply and biliary drainage help in resecting the contiguous segments without disrupting

the vascular supply to neighboring tissue. There are few bloodless planes of dissection and divisions are invisible on the surface of the liver. Liver has an important role in the functioning of various body systems, such as activity of gastrointestinal tract, renal function, metabolic functions including the synthesis and degradation or detoxification of essential compounds; pharmacokinetics of anesthetic and anesthesia adjuncts; and hemostasis. Hepatectomy, an important surgery, done for benign and malignant diseases of liver is associated with high risk of patient's morbidity and mortality and thus demands expert skills on the anesthesia front. Larger the liver resection, more traumatic is the surgery, greater potential for blood loss, lengthy clamping time and more chances of ischemia reperfusion liver injury. Also, hemodynamic management is the main concern during the resection surgery. Blood loss during a liver resection is associated with increased post-operative morbidity rates.^[1,2,3] Age, size of resection, elevated creatinine, bilirubin, albumin levels, deranged prothrombin time, ascites and presence of heart disease are the pre operative risk factors associated with increased post operative mortality. With the advancement in medical sciences and vigilant perioperative care there has been reduction in morbidity of patient. Eighty percent of the liver can be removed, because of the hepatocytes; which are unipotent cells and have the capacity to develop or differentiate into only one type of cell but the risks of liver failure and other complications are high. Since the surgery is complex, the morbidity and mortality rates are high.

Methodology:-

A retrospective analysis of 10 patients with established liver disorders excluding patients with alcoholic hepatitis, ascites, cirrhosis and encephalopathy planned for hepatic resection in age range of 40-50yrs under ASA grade III was done. The study was done to observe the anesthetic strategies during peri-operative period and to assess the post operative recovery phase. After a detailed pre operative assessment, investigations like complete haemogram, liver function, renal function, serum electrolytes, prothrombin time/ INR, ECG, Chest X-ray were done and optimally corrected prior to surgery. Patients were kept nil by mouth overnight prior to day of surgery. On the day of surgery after well informed high risk consent, patients were taken into the operating theatre and multi-para monitors were attached. Intravenous access with two large bore (16G /14G) cannulae was done. They were pre medicated with glycopyrolate (0.004mg/kg), ondansetron (0.08mg/kg), midazolam (0.05mg/kg) and analgesia was given with fentanyl (1-2 µg/kg). An epidural catheter for intra and post operative analgesia was inserted at L1-2 with the tip of the catheter kept at T8/T9, bupivacaine and fentanyl in calculated dose were used. After pre oxygenation with 100% oxygen for 3 minutes induction was carried out with etomidate (0.3mg/kg) and intubation was facilitated by atracurium (0.5mg/kg). Maintenance of anesthesia was carried out with O₂, N₂O, isoflurane (1-2%) and atracurium infusion (0.1mg/kg/hr) under controlled ventilation. During resection PEEP was reduced to zero to reduce the intrathoracic pressure, thereby assisting in venous return and lack of back pressure on the hepatic veins. Post induction central venous catheter for central venous pressure monitoring and drug infusions was secured. Intra arterial blood pressure monitoring and gas analysis was carried out with arterial line access. Patients were monitored with ECG, SpO₂, NIBP, EtCO₂, CVP, IABP, temperature and urine output. Haemodynamic monitoring was the mainstay during the intraoperative period. CVP was recorded and kept below ≤5mmHg in view of reducing the amount of blood loss. Fluid balance was managed meticulously with crystalloids, colloids and blood products maintaining normovolemia. Packed red blood cells were transfused to compensate the blood loss. To maintain adequate perfusion pressure, infusion of dopamine (2-4 µg/kg) and noradrenaline (0.05µg/kg/min) were used. In postoperative phase, patient were reversed with neostigmine (0.05mg/kg) and glycopyrolate (0.1mg/kg) and started on CPAP to avoid lung atelectasis. Patients were shifted to post anesthesia care unit and were extubated once fully conscious and attaining the extubation criteria. Vital monitoring including ECG, SpO₂, blood pressure and temperature was done. Post operatively complete haemogram, blood sugar, electrolytes, blood gases, input-output charting and prothrombin time were assessed and corrected if required. Post operative analgesia was maintained with epidural dose of fentanyl and other IV analgesics.

Results:-

A total of ten patients were operated of which 50% had hemangioma, 30% had Carcinoma Gall bladder and 20% had recurrent multiple hydatid cysts (Fig 1). Degree of pre operative liver dysfunction and extent of liver resection are important for maintaining coagulation profile. Two patients had deranged coagulation profile post operatively managed with transfusion of FFP and vitamin K administration. Forty percent of patients required blood transfusion intra operatively as they had profuse bleeding needing transfusion with PCV and FFP in 1:1 ratio to overcome the loss. Two patients could not tolerate low CVP. In spite of adequate volume replacement two patients had post operative transient renal dysfunction (Table1).

Discussion:-

Planning surgery for hepatic resection requires pre operative assessment and optimization of the physical and pathological condition of the patient. ASA grading assess the physical status, whereas Child Pugh Scoring is done for assessing the clinical status of the patient; which includes serum bilirubin, prothrombin time, presence of ascites, encephalopathy and nutritional impairment. Any pre existing liver pathology increases the risk of morbidity of the patient, thus strict perioperative monitoring and interventions are required during the procedure. Liver function tests are carried out to measure the hepatic dysfunction. Markedly increased aminotransferases reflect extensive hepatocellular injury, such as acute viral hepatitis, ischemic hepatitis and acute drug or toxin induced liver injury and hence they are contraindications to elective surgery. Raised alkaline phosphatase level indicates cholestasis due to calculi or tumors in the bile duct. Albumin, bilirubin, and prothombin time are laboratory parameters included in the Child-Pugh classification which are indicative of the biosynthetic functions and severity of cirrhosis. The MELD score (Model for End-stage Liver Disease score) is also an effective criteria for the assessment of chronic liver disease, its parameters being bilirubin, international normalized ratio (INR), creatinine and sodium levels. The coagulation profile is poor at predicting the risk of bleeding in individuals with liver disease because they reflect changes in procoagulant factors. Prolongation of the INR may reflect instability of the hemostatic balance, but not hypo or hyper coagulability in cirrhosis. Vitamin K (1mg/day) IV/ IM is administered for 3 consecutive days in patients with suspected deficiency (e.g. patients with poor nutrition, cirrhosis, cholestatic disease, with antibiotic use). Administration of antifibrinolytics such as tranexemic acid may reduce operative bleeding. As blood loss is suspected intra operatively; prior to surgery two large bore venous access is secured.

Patients with Child-Pugh scores of B or C should not undergo resection surgery because the risk of postoperative liver failure is very high. Similarly a MELD score of 10 to 15 confers increased perioperative risk, and patients with MELD scores >15 should not undergo surgery.

Alongwith anaesthesia its important to maintain organ perfusion, prevent air embolism, decrease blood loss using anaesthetic skills. Liver disease can affect the pharmacokinetics of anesthetic drugs by changing drug metabolism,

protein binding, and volume of distribution. Selection of drugs and dose adjustments depend on the severity of liver disease. Currently used volatile anesthetic agents (isoflurane, sevoflurane, desflurane) are not associated with hepatotoxicity as seen with halothane.^[4] It is because of the risk of hepatotoxicity, and reduction in cardiac output and hepatic oxygen supply, halothane is not administered to patients with liver disease.^[5] All volatile anesthetics decrease hepatic blood flow to a small extent. Isoflurane and sevoflurane result in little reduction and desflurane result in 30% reduction of hepatic blood flow. Isoflurane and desflurane, undergo less metabolism to trifluoroacetyl chloride (TFA) and sevoflurane does not undergo metabolism to TFA. There is an increase in elimination half life and free drug level of benzodiazepine leading to enhanced sedation. Metabolism is reduced in patients with liver disease, particularly for opioids like morphine and hydromorphone whereas, elimination of fentanyl is not appreciably altered in patients with liver disease, unless repeated doses are administered.^[6] Elimination and recovery from remifentanyl is unchanged by liver disease. Clearance, elimination, and duration of action of succinylcholine, rocuronium and vecuronium are prolonged in patients with liver disease and thus recovery time is delayed.^[7] Metabolism of atracurium and cis-atracurium are unaffected by liver disease because it is broken down spontaneously by Hofmann degradation.^[8] However, it is important to monitor the degree of relaxation because patients with liver disease show increased resistance to drug and shorter duration of action. Prolonged neuromuscular blockade can be reduced by decreasing the amount and frequency of neuromuscular blocking drugs. Drowsiness is related to opiates or other accumulating drugs. In case of liver failure, there is risk of hepatic encephalopathy and hypoglycemia. Hence, monitoring of ammonia and glucose levels is important.

It has also been observed that low CVP approach provides with good surgical field, decreased blood loss and requirement of transfusion. Liver has few bloodless planes of dissection therefore larger the resection more traumatic is the surgery. A study by Eid EA et al ^[9] (2005), also concluded that reduction in blood loss and blood transfusion is significantly reduced if CVP is maintained at or < 5mmHg. In 2014, meta-analysis of five randomized trials including 280 patients found that blood loss and transfusion were less with low CVP management for hepatectomy.^[10] In another meta analysis of eight randomized trials (2015), low CVP was associated with less blood loss and lower risk of transfusion (odds ratio [OR] 0.65) than control patients with higher CVP.^[11] Whereas retrospective reviews of living related donor hepatectomies have reported that CVP monitoring did not reduce blood loss, and that blood loss did not correlate with CVP level.^[12,13,14] Reduced blood loss can be attributed to the fact that hepatic venous pressure is dependent on central venous pressure. Low CVP increases negative pressure gradient with respect to right atrium and increase in air embolism which can be detected by transthoracic echocardiography. There is a sudden fall in arterial oxygen and end tidal CO₂. Positioning patient in 15° Trendelenburg position can minimize incidence of air embolism.^[15,16] Management requires infusing fluid rapidly, give 100% oxygen and aspiration of air from pulmonary artery floatation catheter in situ.

Blood loss plays an important role for predicting morbidity and mortality of the patient. Cardiac disease is ruled out as it may increase right side heart pressure, thereby increasing blood loss. In a study by Wong et al ^[17] (2003) stated that “maintaining a CVP < 5mmHg by volume restriction and intravenous infusion of nitroglycerine and a systolic blood pressure above 90 mmHg by intravenous infusion of dopamine (4–6µg/kg) had dramatically reduced bleeding and transfusion requirements.” Epidural anesthesia does not lead to changes in intravascular volume, but only promotes redistribution of blood, decreasing both venous return and portal vein pressure, thus contributing to reduced hepatic congestion and surgical blood loss.^[18] Blood loss is also reduced by clamping hepatic artery and portal vein called Pringle’s maneuver. Prolonged clamping leads to warm ischaemia. Clamping is not done for more than 15 mins and then released for 5 mins. The clamping of hepatic artery and portal vein increases the backflow through hepatic vein.

Positive end expiratory pressure (PEEP) is reduced to zero to reduce the intra-thoracic pressure, and to increase in venous return and thereby decreasing the back pressure on the hepatic veins. In case of blood loss more than expected, transfusion is required. All cases which are done under epidural anaesthesia are done after ruling out any coagulation abnormality and are observed in postop period for spinal haematoma. Patients with microvascular bleeding, or who are at risk of bleeding due to percutaneous procedures, platelets are transfused to achieve a platelet count ≥50,000/microL, and cryoprecipitate transfusion to maintain fibrinogen levels ≥200 mg/dL.^[19,20] Ho AM et al ^[21] (2007) concluded that “the high prevalence of deranged haemostatic measurements after hepatectomy peak on day 2, because of the complex haemostatic changes related to both the cancer and the surgery and it could not be determined whether these changes were associated with an increased risk of epidural hematoma”. Another study by Stamenkovic DM et al ^[22] (2011) noted that “there is no single reported case of epidural hematoma as a consequence of epidural catheter insertion or removal after elective hepatectomy”.

Enhanced Recovery After Surgery (ERAS) protocols in postoperative period are being increasingly used which help in reducing the duration of hospital stay and morbidity rates. After the surgery is over patient is reversed back and extubated after full filling the extubation criteria. Prolonged intubation and sedation may lead to retention of secretions in the basal lung leading to atelectasis. This can be prevented by early application of Continuous positive airway pressure (CPAP) after extubation. Postoperatively pain is managed with doses epidural and IV analgesics. Injection fentanyl 0.5- 1 µg/ kg in diluted form can be used for post operative analgesia through epidural catheter. IV analgesics like Nefopam which has no hepatic metabolism and can be used in combination with opioids.^[23] Paracetamol infusion is used cautiously and for a short period. Coagulation profile (PT, aPTT, INR) is monitored as there is transient insufficiency of remnant liver to synthesize new factors. Coagulation disorder if present, epidural catheter removal is delayed till coagulation profile is corrected. Intravenous fluids should be managed carefully to avoid ascites, edema, and/or heart failure.^[24] Care is taken to prevent ascites, as incidence of exudative ascites is 50% in liver resection cases.^[25] Ascites can occur because of cirrhosis, high portal pressure, exudation, splanchnic arterial vasodilatation. The management includes monitoring of fluid infusion and simultaneously taking measures to maintain renal perfusion and diuresis. The strategy includes plasma substitutes, diuretics and vasoconstrictors. Hypovolemia is corrected which can predispose to decrease renal perfusion and GFR. Preventing renal impairment is another important consideration for the anesthesiologist. Renal auto-regulation ceases below a renal perfusion pressure of 70 to 75mmHg, below which, flow becomes pressure dependent. Renal failure can be corrected by hydration. Strict input output monitoring, BUN, serum creatinine are done to detect renal dysfunction. Patients with preoperative cirrhosis tolerate a reduction in renal perfusion pressure poorly and extra care must be taken to maintain perfusion pressure in order to preserve renal function.^[26] Serum electrolytes are investigated and if hyponatremia needs to be corrected, it should be corrected and is done slowly to avoid central pontine myelinolysis. Hypokalemia and metabolic alkalosis can occur with liver disease, and may trigger or exacerbate hepatic encephalopathy. Hypothermia is taken care off with use of warming blankets, warm IV fluids and ambient room temperature. Early post operative nasogastric feeding is important. It is usually started at the rate of 10ml/hr and is gradually increased. It helps to maintain gut function.

Conclusion: Improvement in surgical and anesthetic skills, use of risk reduction strategies, preoperative assessment, and hemodynamic management can help in better patient outcome with reduction in morbidity and mortality. Anesthetic vigilance along with thorough knowledge of surgical manipulations promotes team based health care in the operative room. Keeping in mind all the above discussed strategies and planning we were able to carry out the anesthesia with reduced post operative complications and any incidence of mortality.

Abstract

Laparoscopic procedure can be feasible in patients with acute cholecystitis though a dense adhesion is common cause of conversion to open. which is prevented by intraoperative cholangiography. In this study it is 2% cases benefited. Hence benefits of cholangiography are reduced because of pre-operative diagnosis by other investigations modalities. The present study conducted at Department of General surgery Dr. D. Y. Patil Hospital and research centre, Kolhapur and MGM College, Mumbai. To study A Value of Routine Intraoperative Cholangiography in Cholecystectomy .

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

The extrahepatic biliary tree was first visualized in 1918 when Reich injected bismuth and petrolatum and defined a biliary fistula, thus opening the field for further studies of the biliary tree. Intraoperative cholangiography(1) (IOC) was introduced in the 1930s. Mirizzi recorded the first series of intraoperative cholangiography in 1932 using static films(2). It was employed inconsistently in the 1940s and 1950s, but in the 1960s and the 1970s, its use became commonplace. Later, the mobile C-arm image intensifier using a TV monitor was reported in a series by Berci and colleagues in 1978. The rationale for its routine use included: demonstration of aberrant ductal anatomy; avoidance of iatrogenic ductal injury; and detection of common duct stones. Patients with signs or symptoms of choledocholithiasis or with uncertain anatomy should undergo cholangiography. There is, however, controversy over whether IOC should be performed in those patients without signs or symptoms of choledocholithiasis and with clear anatomy. Intraoperative cholangiography adds time and cost to an operation. In addition, IOC has a false positive rate of 1-3%, leading to unnecessary biliary explorations and resulting in increased morbidity and mortality. Furthermore, the IOC can result in complications itself. This study focuses on the value of IOC in cholecystectomy and would help in proving, if at all, there is a rationale for its routine use.

In 1987, 105 years later, Philippe Mouret performed the first laparoscopic cholecystectomy (LC) in Lyon, France(3). A prospective study describing 500 laparoscopic cholecystectomies, was published by C.R. Voyles. The laparoscopic procedure was completed in 95 % of the patients, There was no mortality or bile duct injury, concluded that laparoscopic cholecystectomy was a safe procedure in the treatment of gallbladder disease(4).

The Southern Surgeons Club described 1518 laparoscopic cholecystectomies in prospective analysis, With respect to mortality, complications and length of hospital stay. A slightly higher incidence of biliary tract injury in the laparoscopic procedure is probably offset by the low incidence of other complications. Furthermore it is possibly caused by the inexperience of most surgeons starting endoscopic procedures(5).

The aim of this study was to determine the necessity for intraoperative cholangiography (IOC) during pediatric laparoscopic cholecystectomy (LC).

The success rate of LC in cases of acute cholecystitis is slightly higher when IOUS is used as an aid to dissection. In the absence of definitive prospective data, we recommend routine use of IOUS when performing LC, particularly in patients with acute cholecystitis(7).

This study was to compare the results of laparoscopic extracorporeal ultrasound (LICU) to those of fluoroscopic intraoperative cholangiography (FIOC) during laparoscopic cholecystectomy (LC) after the initial learning curve for LICU.

Materials And Methods:-

The present study was conducted on patients admitted for surgery in the **General Surgery unit of Tertiary care hospital**. Total of **100 Cholecystectomy elective surgeries** in the General Surgery unit in Dr. D. Y. Patil Hospital, Kolhapur and MGM College, Mumbai from **August 2010 to December 2012** were included in the study. The study included all patients irrespective of their Age, Sex, associated co-morbidities and previous surgeries. Information was collected from the patients after a Written, Valid, Informed consent. The study was **approved by IERC**.

Inclusion Criteria:-

1. All age group
2. Male and Female
3. Cholelithiasis
4. All cholecystectomy patients
5. Biliary Pancreatitis

Exclusion Criteria:

1. Cirrhosis with Ascites
2. Deranged bleeding profile

Preoperative Evaluation of a patient with gallstones Disease:-

In addition to a careful history and physical examination, preoperative testing for 90% of patients with gallstone disease(8) is minimal. An ultrasound of the right upper quadrant usually confirms the diagnosis, and the hepatic biochemical profile usually determines the likelihood that CBD stones are present and may warrant a preoperative MRCP/ERCP or an abdominal computed tomographic scan, or both, to search for the cause.

The diagnosis of biliary colic and acute cholecystitis, when the history and physical examination are less than definitive, can be made with a nuclear hepatobiliary hepato iminodiacetic acid (HIDA) scan(9). An ejection fraction of less than 50% at 30 minutes suggests poor contractile function and incomplete emptying of the gallbladder. Intravenous cholangiography, which is rarely performed in the United States, is popular in Europe for detecting CBD stones preoperatively in patients with abnormal liver function studies.

Postoperative Management:-

With advances in anaesthetic and postoperative analgesic care, early mobilization and discharge are the norm. In those patients in whom a T-tube has been placed, a cholangiogram is obtained on the 5th to 7th postoperative day

In routine cholecystectomy, no drain or nasogastric tube is required. The patient can resume fluid intake and diet when tolerated. Closed abdominal drains should be employed in those patients in whom there are concerns for the development of a postoperative collection or when the CBD has been opened. These drains should be removed within 24 to 48 hours when the volume is less than 100mL per day and there is no bile or fresh blood evident. Mild derangement of liver function tests may arise after uneventful cholecystectomy.

Observations And Results:-

There is study of total 100 cases from a Tertiary Care Hospital. In this study the mean Age is 45.41 with standard deviation is 13.76.

Table 1:- Descriptive Statistics.

Statistic	Age
Number	100
Minimum	16.00
Maximum	76.00
Mean	45.41
Std. Deviation	13.76

According to sex there are total 64 female and 36 male. Its implies that it is common in female population.

Table 2:- Sex-wise distribution of patients

Sex	Frequency	Percent
Male	36	36.0
Female	64	64.0
Total	100	100.0

Table 3:Distribution according to Clinical Presentations

Clinical Presentation	Frequency	Percent
ACUTE	31	31
Pancreatitis	3	3
CHRONIC	66	66
Total	100	100

According to clinical presentation out of 100 patients 31 (31%) were presented as acute cholecystitis, majority of them were diagnosed as acute on chronic cholecystitis on histopathology. If patient presented with in 72 hours of pain can be taken for cholecystectomy. Out of 100 patients 66 (66%) were Chronic and were diagnosed on ultrasonography with single or multiple gall bladder calculi are straight taken for cholecystectomy. 3(3%) patients had Pancreatitis who conserve, should do CECT abdomen which is normal, operated on same admission. All patients were operated electively under general anesthesia.

Table 3:- Past abdominal surgeries:

Past Abdominal Surgery	Frequency	Percent
Yes	11	11.0
No	89	89.0

Of the 100 cases 11 patients gives past history of upper abdominal surgery because its affect the treatment modalities of the surgery. Most prefer surgery for past upper abdominal surgery patient is open cholecystectomy compare to laparoscopic cholecystectomy as there is lot of adhesion while laparoscopy is perform and high chance for conversion to open cholecystectomy.

Table 4:- Comaparison of laparoscopic or open cholecystectomy

Table 4: Laparoscopic/Open cholecystectomy & cholecystostomy		
	Frequency	Percent
Open cholecystectomy	51	51.0%
Laparoscopic cholecystectomy	42	42.0%
Laparoscopic cholecystostomy	7	7.0%
Total	100	100.0%

Of the 100 cases study, open cholecystectomy is done in 51(51%). Laparoscopic cholecystectomy in 42(42%) and 7(7%) undergone laparoscopic cholecystostomy which after 4-6 weeks undergoes cholecystectomy after intraoperative cholangiography.

Duration of Surgery:-

The mean operation time for Laparoscopic cholecystectomy was significantly longer than for Open cholecystectomy and cholecystostomy. The distribution of operation time, among these groups is depicted in Table. The mean (range) operation time for laparoscopic cholecystectomy was 84-90 min (mean = 87.02 min), 66-77 min (mean = 72 min)

for open cholecystectomy and 31-39 min (mean = 35 min) with highly significant ($p < 0.001$). The 'F' value is 37.47. During the study period operation time for laparoscopic cholecystectomy showed a tendency to become shorter. Duration increased due to intraoperative cholangiography (about 15 min) as we became more familiar with laparoscopic IOC duration decreased..

Table 5:- Duration (in Minutes) according to Type of Surgery

Type of Surgery	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		F-Stat	Significance
					Lower Bound	Upper Bound		
Open cholecystectomy	51	71.8627	19.10395	2.67509	66.4897	77.2358	F=37.47	p < 0.001, Highly significant
Laparoscopic cholecystectomy	42	87.0238	10.59565	1.63494	83.7220	90.3256		
Laparoscopic cholecystostomy	7	35.0000	4.08248	1.54303	31.2243	38.7757		

Post operative hospital stay:

Table 6:- Hospital stay according to Type of Surgery.

Type of surgery	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		F-stat	Significance
					Lower Bound	Upper Bound		
Open cholecystectomy	51	6.1373	3.47574	.48670	5.1597	7.1148	8.188	p < 0.001, Highly significant
Laparoscopic cholecystectomy	42	4.8333	2.17431	.33550	4.1558	5.5109		
Laparoscopic cholecystostomy	7	10.2857	7.06433	2.67007	3.7523	16.8191		

Of the 100 cases, The hospital stay for open cholecystectomy range 5-7 days(mean 6.13 days), laparoscopic cholecystectomy is range 4-6 days (mean 4.83 days) and for laparoscopic cholecystostomy is 4-17 days(mean 10.29 days) with high significance $p < 0.0001$ value. The 'F' value is 8.188.

Post operative stay in laparoscopic cholecystostomy is more because to see for drainage from the tube is proper or not. In open cholecystectomy operative pain is more compare to laparoscopic hence it takes more hospital stay.

Intra-operative Complications:-

Table 7: Intra operative Complications

Intra operative Complications	Frequency	Percent
Yes	2	2.0
No	98	98.0
Total	100	100.0

The incidence of intra-operative complications is only 2% of the study. There is difficulty in cholecystectomy and cholecystostomy. There are two interesting case are one which presented intraoperatively choledochoduodenal fistula(10) and left lobe gall bladder(11). In both cases it took little longer time but surgery done without any intraoperative complications.

Benefits of Cholangiography:

Table 8:- Benefits of cholangiography.

	Frequency	Percent
Yes	2	2.0
No	98	98.0
Total	100	100.0

In this study only 2 (2%) cases shows the benefit of the cholangiography of which both are interval cholecystectomy which presented after 72 hours to see for the position of cystic duct in relation to CBD.

Discussion:-

The present study including 100 cases was carried out in the department of surgery, on patients who underwent intraoperative cholangiography and cholecystectomy.

Our study was based on studying patients with pain in the right hypochondrium due to varied etiologies(12), both in males and females of all age group, who underwent the above procedure.

Acute:-

Patients who were admitted with severe acute pain in the right hypochondrium, were advised to do complete blood count, liver function test, serum amylase and serum lipase levels. These being normal and ultrasound findings showing cholelithiasis, patients were posted for cholecystectomy. Acute cases who presented in first 72 hours were taken for laparoscopic cholecystectomy. Patients presenting after 5 days were treated conservatively with intravenous antibiotics, intravenous fluids, discharged and operated after 6-8 weeks. If these patients did not settle with conservative management, they were taken up for surgery and more often underwent cholecystostomy due to dense adhesions. Our threshold for cholecystostomy was low because these patients were usually in sepsis and had medical co-morbidities.

Fig 23:- Laparoscopic cholecystostomy(arrow Black- drain & Blue- cystostomy foley's drain

Biliary pancreatitis:-

In patients with cholelithiasis, pancreatitis was diagnosed with increased level of serum amylase and serum lipase(13). Patients were treated with nothing per orally, ryle's tube insertion, analgesic & somatostatin (3mg in 5% dextrose over 12 hourly for 3 days)(14)(15). If the stone was in the terminal CBD and patient was stable then endoscopic papillotomy with stenting used to be done in first 72 hours.

When pancreatic ileus(16) settled down we got CECT Abdomen to look for necrosis of any part of pancreas, fluid collection and peri-pancreatic stranding.

If only pancreatic oedema was seen, with no fluid collection or necrosis then in same admission laparoscopic cholecystectomy was advised.

Obstructive jaundice due to cholelithiasis:-

Patients who presented with obstructive jaundice due to CBD stones(17) were first taken up for ERCP with stenting after 48 hours. If the liver function test, amylase, lipase was normal then we went ahead with laparoscopic cholecystectomy in the same admission(18).

Cholangitis with choledocholithiasis:-

These patients underwent ERCP with or without naso-biliary drain and cholecystectomy was done when clinically cholangitis settled.

Symptomatic cholelithiasis(Diagnosed USG):-

Patients with recurrent right hypochondriac pain which settles without treatment

Or Murphy's sign positive were taken up for laparoscopic surgery without any further investigations apart from routine pre operative workup.

Incidental Cholelithiasis:-

Incidental cholelithiasis(19)(20) was mainly diagnosed on routine USG abdomen. Patients with less than 2.5 cm stones were advised a HIDA Scan. If it showed more than 50% Gallbladder Ejection stones were radiolucent then dissolution therapy with ursocholic acid was started.

Negative predictive ability of the set of criteria was 100% for patients up to 60 years of age and 97% for patients older than 60 years at the time of operation. No case of residual common bile duct calculi was present in the IOC and no-IOC groups at follow-up. (Our data strongly support a policy of performing IOC during cholecystectomy only when clinical criteria suggest the presence of common bile duct abnormalities or to clarify ductal anatomy)(17).

Since the introduction of laparoscopic cholecystectomy (LC), an increase in accidental common bile duct (CBD) injuries of up to 1.2-1.6% has been reported. In the present prospective study of 1,710 patients undergoing cholecystectomy we tested the predictive value of routine intraoperative cholangiography (IOC). The IOC was feasible in 92.4% of the cases in the LC group and in 83% of cases in the OC group and presented a complete depiction of the extrahepatic bile system in 98.3%. Anatomic variations of the bile duct system, which influenced the operative management, were found in 13.2% of cases. In 2.5% of the patients, preoperatively undetected CBD stones were also found. Method-specific complications did not occur in any of the patients. Additionally, in a controlled subgroup analysis of 163 patients, we evaluated preoperative intravenous cholangiography (IVC) and IOC. Intravenous cholangiography showed only 72.4% of the operation-relevant anatomic variations (vs. 100% by IOC); in 6.1% of the cases, there were reactions to the dye (vs. none in IOC), and in only 28.6% of the patients, CBD stones were detected (vs. 71.4% IOC). There were four bile duct injuries (0.29%) during LC and two (0.4%) during OC. All injuries were detected intraoperatively and fixed in the same setting without postoperative complications. In conclusion, we recommend the use of routine IOC during cholecystectomy. By this technique, anatomic variations of the bile duct system will be visualized and therefore accidental injuries will be avoided(18).

Conclusions:-

- In cholecystectomy if cystic duct is definitely identified then IOC is of no help in the safety of the procedure.
- IOC should be done in teaching hospitals for learning the procedure and also for safety as the operating surgeons are of limited experience.
- In very difficult cholecystectomies a cholecystogram should be done early in the procedure to delineate anatomy before definitive dissection of the calots triangle.
- Low threshold for cholecystostomy should be preferred rather than stubborn dissection which lands in disaster.
- Equipment for IOC should be kept ready and need based IOC should be practiced.

Abstract

Values are the moral or spiritual aspect of the Islamic civilization and also the soul and basis for any civilization. Therefore, they ensure the secret of human's survival and elasticity throughout the history. If values fade away one day, man will lose his/her moral warmth, which is the spirit of life and existence; mercy will abandon his/her heart; his/her ethics will not be able to play its role; he/she will no longer know the truth of his/her existence; and he/she will be bound with material restrictions. This study aimed at exploring the major domains of security values and their efficacy on the Islamic Education. Thus, the review will propose some suggestions for stakeholders, educationalist, and learners to have the proper inclusion of security values in order to maintain the coherence and integrity of Muslim societies.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

The Islamic religion seeks to secure five imperatives that supports the human life; namely: the religion, brain, soul, money and dignity. So this is considered as the most comprehensive sense that necessitates building the most important pillars of the communities that must be preserved; so the soul that is honored by God must be preserved in security and safety from various hazards and disasters.

The Islamic culture curricula are one of the Islamic materials that are consistent with the other materials in the construction of Islamic thought properly; Article (12) of the education policy in Saudi Arabia calls for: "guiding the science and knowledge of various kinds and its methodology towards the Islamic doctrines and their methods of investment in order to be derived from Islam which is in consistent with the idea of Islamic governance (The Ministry of Education, 1390 H, p.9).

Hence, there was a need to consolidate the concepts and values of the Islamic culture in light of the challenges of civilization for reasons of human nature before being a Muslim. All Muslims believe in this religion and avoid its prohibitions; and it is innate and natural to every individual to belong to a family, group or a national to have his/her character represented in his/her community.

The Islamic Culture is one of the most important ways that can constitute Muslim generation which addresses these threats and challenges. The Islamic civilization can support the humanity with the values of truth, goodness, virtue, tolerance, prosperity, security, reassurance, well-being and happiness. On the basis of the educational policy in Saudi Arabia, which decided to teach the Islamic Culture in different colleges; because this is the fertile phase for the participation and dissemination of faith, and for the return of the Islamic, noble values, high ethics, and this confirms confidence in the validity of Islam to lead humanity, and to guide anytime and anywhere, and to broadcast

Corresponding Author:- Mohammed Bin Saad Saleh Altamimi.

the Islamic spirit which is enkindled in the soul the aspiration to high ideals, to resume the well-being, and the belonging to the nation of Islam. This shall appear as described by the Almighty by saying: *'You are now the best people brought forth for (the guidance and reform of) mankind. You enjoin what is right and forbid what is wrong and believe in Allah. Had the People of the Book believed it were better for them. Some of them are believers but most of them are transgressors.'* (Quran: Al-Imran, 110).

It is important then to adopt values of communities in the role of education by preparing curricula and textbooks properly to embrace the value of all kinds to provide learners with knowledge and action in order to maintain the interests of the individual and society hoping to show excellence and to maintain it. However, textbooks pay attention to the cognitive domains which had side effects on security in the community such as the increase in the rate of crime which poses a realistic indication that the imbalance may hit the values in society which requires competent attention to the curriculum which instill the values of security to fight crime and associate patterns of behaviour on the part of the individual and society, too (Ghanem, 1999).

Many studies such as Al-Ghanim (1994) , Al-Qaisy (1996), Al-Yahyawi (1417H), Jaroudy (1417H), and Aql (1427H), have emphasized the importance of values in the lives of individuals and groups as one of the most important inputs that govern human behavior which play an important role in both individual and group in the present and past. This is one of the components of the individual personality and the guidance of his/her conduct. Values are considered the reference framework for governing behavior, preferences and choices. On the other hand, values achieve social cohesion and integration inside the community and can build its identity and his well-being to achieve economic, industrial, social development, so the values are one means of achieving this development. However, the studies on values in school curricula and textbooks are so few compared to the studies conducted on other educational areas. Therefore, the security values have little interest, despite the suffering of Islamic and Arab countries which may adversely affect the tranquility of the groups and the individuals; as well as the negative reflections on the communities and their future.

Given the vulnerability of attention to the transplanting of security values in the hearts of young people, it was necessary for the curriculum in the kingdom of Saudi Arabia to reflect these values, besides other Islamic countries in order to help learners to cope with positive attitudes rooted in Islamic culture towards the development of noble values in the hearts of young students.

Previous Studies:-

The study of Al-Jarady (1993)

This study is entitled "Analysis of the values contained in Islamic education books for lower basic education in the Republic of Yemen" and aimed to identify the values contained in the books of Islamic education for the lower years of primary school students in the Republic of Yemen, to identify the distribution of values according to the domain, and then to find the extent of variation in the distribution of the values in the fields due to the variables of grade and subject.

The study sample consisted of all Islamic textbooks for the primary phase of Education in the Republic of Yemen. The researcher used in his study the descriptive method in accordance with the method of content analysis through a questionnaire and observation card. To achieve the goal of the study; the researcher has classified the values into two dimensions which are the content through rating values for the following areas:(the legislations, worshipping, personality, society, materialism) and the second dimension classification of the values according to (positive values, negative values).

The study concluded that the most important of which are: that the values contained in the books of Islamic education for the lowest stages of the Education need to be revisited, tested and identified. There is a need to exert more care and attention to gender-related behaviour. There is a need to take into account the balance, integration and inclusion in the distribution of values.

The study of Al-Shuhomy (2006)

The study is entitled:"The extent to which the books of Islamic education at the secondary level help in addressing peace and safety for high school students in the state of Kuwait", It aimed to identify the extent to which the books of Islamic education in the secondary phase contribute in addressing peace and safety for high school students in the

state of Kuwait, and to find out the values that help in addressing peace and safety of high school from the teachers' perspectives.

The study sample consisted of all Islamic textbooks at the secondary level in the state of Kuwait. The researcher used in his study the descriptive method through the analysis of the content addressing the teachers of Islamic education by a questionnaire in order to measure the student misconduct and identify methods of treatment. To achieve the goal of the study; the researcher described the reality of peace and safety among the students of the secondary stage from the point of view of teachers and the values that help in the treatment. The study concluded that the most important thing to highlight is the negative social behaviour. The values that help in the treatment of peace and safety are those attributed firstly to the social dimension followed by the personal dimension, followed by the religious dimension, then the scientific dimension.

Problem of the study:-

In light of the foregoing, the problem of the study is addressed in the following question:

'What are the security values to be met by the Islamic culture curricula provided for students of general education?'

Justification of the chosen problem of the study:-

A. Security values adjusts the behavior of individuals and enhances the individual, community and professional responsibility; necessitating the need to search them.

B. The Islamic education curricula maintain human culture a Muslim, as well as the past and heritage that is streamed from the Quran and the Sunnah of Prophet Mohammad (PBUH).

The objectives of the study:-

The study seeks to achieve the following points:

1. To prepare a list of the security values that should be included in the Islamic Culture curricula in general education.
2. To make some procedural recommendations necessary for the planners of curricula to improve the content of Islamic culture curricula.

The importance of the study:-

The study and its relevance to the Islamic culture themes can be highlighted as follows:

A. Scientific importance:

- Development of the content of Islamic Culture curricula in public education, and detects the extent of availability of security values that could be integrated and confirmed in the hearts of learners.
- Draw the attention of the planners of curricula and authors of educational books to security values that should be included in the books of Islamic Culture.
- Emphasize the attention to security values and the need to be addressed in the content of Islamic Culture in all institutions.

B. Practical significance:

1. Make a list of the main security values in the content material of Islamic Culture in general education.
2. Acquaint the teachers and learners with the force and effect of the reflection of the security values on their performance; to positively achieve the security values desired.
3. This study is a natural extension of studies in other areas, it is also the kernel to do similar studies in the field of security values, no one has addressed such a study in the field of Forensic Science or Humanities in general.

Definitions of terms:-

The values are all that contain integrity and constancy of human being in recognition of the lordship, the Almighty. This value is what directs the human's behavior and thoughts directly to God especially in times of distress and dismay.

Al-Sha'wan (1417H) defines the values as 'abstract concepts, metrics or standards either implicit or explicit that are used to judge something as desirable or undesirable, and guide the behavior of an individual of what is desirable by society.'

Security values:-

Security Values are a set of security standards called for by the company group to help learners guide the behavior of his/her security to sustain the community and maintain the integrity of its behavior through the content material of Islamic Culture. By studying the meanings and definitions of the values, we find that there are common features among them are summarized by Mary and Balqis (1982), Al-Jaroudi (1417H), Aqel (1427H)

- values are humane; and thus caring, pleasure, pain and thoughts are connected to the individual.
- values are subjective, anyone senses the values according to his/her criteria
- Values are relative as it varies from person to person, and from time to time, and from place to place, and from culture to culture.
- values have a hierarchy and some values have dominance over other values
- values have preferential standard that represents a reference framework and governs the actions of the human and explains his behavior.
- Values govern the human choices and his/her preferences.
- Everyone has his own value -system that is acquired through the interaction between individual knowledge and the culture in which he/she live in.

Importance of values:-

Values identify the objectives of the society and its activities, and they guide its ideology towards specific targets; no matter how scientifically and globally the nation has gone through, still it needs a system of values.

Allah (SWT) says 'What you have been given is only the fleeting enjoyment of this world. Far better and more lasting is what Allah will give to those who believe and trust in their Lord; who shun great sins and gross indecencies; who forgive when they are angry; respond to their Lord; keep up the prayer; conduct their affairs by mutual consultation; give to others out of what We have provided for them; and defend themselves when they are oppressed. The harm can be requited by an equal harm, though anyone who forgives and puts things right will have his reward from Allah — He does not like those who do wrong. (Al-Shura 42:36-40).

Therefore, Islam is the religion of faith, worship and values. Values are the ideals that we uphold and we must live by. Since we pay attention to our beliefs and worship, one should also pay attention to our values. Values give you clarity of thought and help set one's priorities. The values of Islam are considered the noblest moral principles for human development. The Prophet – peace be upon him – said, 'I am sent only to fulfill the noblest characters.' (Musnad Al-Bazzar, Hadith 8949).

The significance of values for the individual is in being the essence of the real human and without them he/she loses his humanity and becomes a beast controlled by the whims and desires. They determine the individual's paths and partnerships in life that are directed to what should be done or avoided.

Positive values are considered a fence from regression towards the lusts; and without values humans become slaves to bad habits that destroy the individual and society and threaten its security. Positive values make the individual active in his life and lead him to success and progress. They also increase the confidence of the individual and enhance his/her virtue and his/her human energy as well. They lead him/her to success and confidence. Without values, the human will be a failure.

Impact of Islamic values:-

And the Islamic values have impact on the positive behaviour of the individuals and communities. According to Al-Jallad (1430H), Al-Yemany (2009), Sallom, Taher and Jamal (2009), Islamic security values:

A- Impact on the behavior of the individual as:

- That values and standards represent the essence of the real positive human; and without them the individual loses his humanity and becomes an animal controlled by its passions and desires.
- Determine the course of individual and direct behavior in his/her life, to safety.
- Protect the individual from drifting behind the lusts and desires.
- Is the fence that saves the human from psychological, physical, social regression, and reforms him/her morally, socially and educationally.
- Provide Human with self-esteem in life and keep him full of power, away from passivity.
- Strengthen the virtue of the human and enable positive interaction with different life situations.

B. Impact on the behavior of the community as they

- Stimulate the community's survival and continuity, it depends on what values the community possesses which are the foundations and directions of positive behaviour that builds upon the progress of societies and its advancement.
- Stimulate the community's identity and distinctiveness, since they are the foundation of the culture of the society, which shape the patterns of human behavior, practice. Thus, the values are markers of distinction that distinguish the groups from each other.
- Reserve the society of negative social and moral behaviours as they are protective to the community.
- Strengthen community unity and cohesion by identifying the life's goals and ideals.
- Help the community to face the changes that occur through healthy choices.

The pioneers of Islamic education have over-emphasized the values since Imam Al-Ghazaly thinks that to achieve happiness for humanity in this world and the Hereafter is the supreme value in the moral education. Happiness in the hereafter are the main results of adherence to Islamic values. It is, therefore, necessary to take all means and ways that lead to the happiness of the humanity; which is the ultimate goal of education.

Security Values:-

In his/her life, the human is living amongst his social stratum that is not secluded from others. Although the social values shape the individual's relationship to others; the security values determine the correct path for the individual to live in stability and maintain his/her security in the community. They enhance the sense of security, especially his soul security and the rest of the members of the community generally. They help instill the values of security and dissemination in different environments or communities which prepare the individual to get health behaviour that can protect his/her nation and homeland, and secure a life free of fear, unrest and discomfort. The security values are imperative as follows:

- They achieve the nation's dignity, security and happiness .
- The absence of security values disrupt the security of all its components.
- The security values have its roots in the doctrine of the Islamic nation that determines its identity.
- In achieving the security values, then the individual, society and nation are protected from threats against their security.

The security values are so imperative in the society which desperately seeks to promote itself and direct the behaviour of the individual, society and all social groups especially the security personnel, teachers, and learners. These security values have power in adjusting the behaviour and in teaching individuals the seriousness, honesty, trust, responsibility, obedience, commitment, fight against corruption, and the development of feelings of belonging to Islamic and national levels.

Security within social security differs according to specialists depending on the proportions. Security is the society's capacity to face not only the events, facts, individual actions, but all the appearances related to the nature of things that lead to violence. Nafea (1972) explains it as 'the sense of individual and group towards the satisfaction of organic and psychological motives such as the physical, psychological security towards the contentment of the community to the demise of what threatens the manifestation of this motivation such as the permanent and stable, livelihood and the psychological motives of society's recognition of the individual and his/her role within it'. Ali (1976) sees it as 'the situation that is available when the security of the country is not breached in the form of crimes or in the image of a dangerous activity in order to take preventive measures to stop the dangerous activities.'

Therefore, security values represent the standards and principles derived from the provisions of Islam, used in guiding human behavior toward achieving security and preservation, awareness of the importance of the security, the commitment to legislations, regulations, security and respect. This is summarized in the following:

1. They are derived from divine revelation (the Qur'an and Sunnah).
2. They maintain the individual, social and national security.
3. They are moderate values.
4. They keep the legacy of the nation's cultural authenticity and identity.
5. They keep the economy of the nation locally and the globally.
6. They are connected to the individual, society and nation to the degree of nobility and innocence.

Functions of security values:-

The role of values in guiding behavior is fundamental and basic, both on the level of the individual or society because of its positive impact on the human. The system of values, if settled and assimilated by the individual, has

become the standard and authority in leading his/her positive behaviour through five basic functions as defined by Isa (1984):

1. The values provide the individual with a sense of what he is doing and geared towards to achieve its purposes.
2. They create the basis for individual and the group.
3. They are the basis for judging the behavior of others.
4. They enable the individual to know what to expect from others and their reactions.
5. They gave the human the sense of righteousness and wickedness.

Results: Domains of security values:-

The researcher has reached to a list of security values referring to the books and previous studies, and other regulations related to security matters. Six domains were identified; namely, Ideological Security, National Security, community Security, Cultural Educational Heritage Security, Military Security, Economic Security.

The first domain: ideological security:-

This value is achieved through following the Islamic faith, tolerance and commitment to the orders of the divinely orders that make the human being seek in this world and the Hereafter; and these include the following:

1. Enjoying the orders of the Islamic.
2. Cooperation in righteousness and piety.
3. Respect for Human Rights.
4. Justice in contentment and anger.
5. Promote a spirit of tolerance.
6. Refute pervert thought.
7. Link to holy shrines.
8. Achieve fidelity in the work.

Second domain: national security:-

This domain strengthens the human belonging to his/her homeland, preservation and defense of home-country and respect of its principles, and transplantation of well-being. This includes the following:

1. Boast of belonging to Islam.
2. Obeying the state representatives without disobeying Allah.
3. Good citizenship.
4. Defend issues of the nation.
5. Maintain unity and connectedness.
6. To achieve the principle of Shura (Advisory Teams).
7. Maintaining the Muslim legislations.
8. The consolidation of security and fight against crime.
9. Upgrading the security.
10. Maintaining general rules.
11. The deepening belonging to the homeland.

Third domain: societal security:-

This value binds the individual with his/her society as a whole in which they live through cooperation and commitment about being responsible towards the society without breaching the general rules in order to ensure unity among its members. This includes the following:

1. Social stability.
2. Cooperation and provoking community spirit.
3. Social integration.
4. Commitment to responsibilities.
5. Refute racism and poverty.
6. Non-violation of liberties.
7. Renunciation of defamation.
8. Avoiding rumors.
9. Maintaining legitimate rights.
10. The deployment of the principle of proportionality.

Fourth domain: cultural and educational security:-

These values tend to keep the cultural identity within positive thought in order to elevate the nation with honesty, integrity, respect, and guidance about everything that can affect that identity. This includes the following:

1. Positive Cultural openness.
2. Appreciate scientists.
3. Scientific honesty.
4. Spreading the culture of reading.
5. Respect the opinions of others.
6. Protection of the manifestations of the intellectual invasion
7. The fight against illiteracy.
8. Assist in national issues.
9. Awareness of the importance of Health prevention.
10. Instill good attitudes and conduct.
11. Awareness of the dangers of environmental pollution.
12. Awareness of the dangers of addiction (drug and alcohol).

Fifth domain: military security:-

Military values bind human beings in general with security, especially the ideals that are manifested with honesty to achieve precision and maintenance of security in which man lives safely and securely. This includes the following:

1. Respect for the principles of military.
2. Be a model of good conduct.
3. Maintaining honesty and integrity.
4. The performance of duty to the fullest.
5. Precision in the implementation regulations.
6. Well-behaved.
7. Taking into account being organized.
8. Promote self-courage.
9. Respect the rights of others.
10. The protection of the vulnerable.
11. Keeping secrets. 12. Positive leadership.

Sixth domain: economic security:-

These values tend to sustain financial stability and preservation, maintenance of public money from damage away from corrupted financial dealings in the public economy. This includes the following:

1. To instill the principle of productive work and its appreciation.
2. Provide career opportunities.
3. Maintain public facilities.
4. The preservation of public money.
5. To maintain food security.
6. The rationalization of consumption.
7. Fight goods-fraud.
8. The development of environmental resources.
9. Dealing with unemployment.
10. The optimization of wealth

Conclusion:-

Akgunduz (2016) thinks that '*religion in general and Islam in particular can play positive role in reviving common values for mankind and uniting people for justice and equality, particularly the weaker sections.*'

These days, people interact with each other much more than the past due to cultural exchanges and greater accepting of other values and norms. In each cultural and national value, there must be universal endeavor to address problems of social, educational inequalities, gender inequalities and human rights as well. Global solidarity must be maintained in order to fight injustice towards the protection of human rights. Global solidarity is vital for the protection of the environment, to respond to natural calamities and to battle poverty.

On the contrary of some alleged reasons about Islam and Muslims, Islam attaches much importance to human values, and works to establish general peace and well being. It makes firm love and brotherhood in the structure of society, and puts forward the necessity of union and harmony. It rejects determinedly movements, which obliterate the common values and genuineness between members of society, like tribalism, racialism, and negative nationalism.

Recommendations:-

There is a need to develop clear objectives and content of Islamic education books and to write them down in the introduction to these books in order to enable teachers to identify and adhere to them, and to get to achieve these values through the teaching of the content of the books. There is a necessity of building the content material of Islamic culture in accordance with the standards, principles and rules of accurate scientific targets of Islam, including Islamic security values in support of the behavioural side, the need to distribute these values appropriately to achieve sequence and integration in a more attractive, interesting with high-tech content.

The study proposes to conduct studies to identify the security values contained in the Islamic courses in the military universities and civil colleges. This will increase the sense of security and thus maintain the security of the individual, society and the nation. It is also suggested to conduct more studies on the content analysis of the decisions of the Islamic courses in general education to ensure the availability of security values. It is also proposed to conduct a study on security values included in the decisions of the police sciences that connect to young people and elevate good education which is desirable in the stages of public education.

The religion of Islam has not neglected the human security values since the human is the center of the system of creation, and everything is created for him/her. By investigating Quran and Sunna, it was concluded that Islam has paid high attention to five fields of human security including individual, social, economic, environmental and health fields paying attention to aspects such as culture, politics, society, economy, family, and judging which affect the individual, collective and international aspects. Islam considers human security values as components of the survival of human society, and as health and immunity from any danger. Therefore, realization of human security values in every society requires offering suitable solutions (Faghihi, 2015).

Acknowledgements:-

The author acknowledges the profound gratitude of Allah (SWT) and the glorification of our Prophet Mohammad (PBUH). My gratitude goes to IIUM and all friends, especially my friend, Dr. Osama Abu Baha from Palestine for his generous contribution.

Community Forestry, Community Forest Users Group (CFUGs), Conservation, Sustainable Management, Forest Products

Abstract

Expansion of agricultural land, the growing demand for timber and the local dependency on forest firewood created long term pressure for deforestation in Nepal. This paper investigated the impact of community management on forest conservation and outlines the conversion trend of the forest outlook in Nepal in the past decades by informal interviewing 10 representative Community Forest Users Groups (CFUGs) from the middle hills of the country. The results showed notable positive changes including increased forest cover, improved forest product supply and enhanced biodiversity after implementation of the community forestry program. The main factor behind the forest restoration is sustainable management adopted by the community and control on forest fire and over exploitation. However, the adopted conservative-oriented approach hampers communities to exploit the maximum benefits. It has been recommended that market-oriented approach would help communities to get more economic benefit than the existing approach. The community led initiative in Nepal has set best example in forest conservation and this experience can be explored by other countries as well. Local people's participation is very important and necessary for common resources management. The research results provide fundamental basis for policy making process regarding common pool resources management and forest governance.

Introduction:-

The Community forest management program in Nepal is considered as the most successful example of participatory, collaborative and sustainable forest management. This program has played a vital role in improving forest condition and conserving biodiversity and supporting the local people to enhance their livelihoods (Gurung et al., 2013; Pokharel et al., 2007; Acharya, 2004; Carter et al., 2011; Gautam et al., 2004). Over the period of two decades forest-covered area of the country has increased remarkably and condition of the forest has been enhanced after the government came up with policy and legal intervention to promote the community forestry in the country. Since management rights handover to the community from the government, 86% Community Forest Users Groups (CFUGs) reported improvements in their all forest quality (MFSC, 2013). Community forestry program is effective in increasing the biodiversity in degraded land, conserving and improving the total environmental condition and enhancing livelihood of the users by effective resource management in the middle hills of Nepal (Acharya, 2002; KC et al., 2015; Birch et al., 2014).

Corresponding Authors:-Wenying Xu, Zhigang Liu.

Address:- UNEP TONGJI IESD, College of Environmental Science and, Tongji University, 1239 Siping Road, Shanghai, 200092, P.R. China.

By engaging one third of the country's total population, more than 18,000 CFUGs have been formed in the country and have been able to manage over 30% of the total forest in the country (MOF, 2016). Among them, 75% of community forest users groups were formed in the middle hills of Nepal. A 2013 survey report from Ministry of Forests and Soil Conservation shows that forest conditions have improved in overall since the handover to CFUGs, with 86% reporting improvements in forest conditions. 79% of the CFUGs reported an increase in tree coverage area within the community forest geographical space (MFSC, 2013). The main factor behind the forest restoration is sustainable management adopted by the community and control on forest fire and over exploitation.

Forest Resources of Nepal was mostly controlled by the government and forest administration was centralized in 1970s (Gautam et al., 2004). The idea of local involvement in forest management was conceptualized in late 1970s (Nagendra et al., 2005). As a policy innovation to address the massive forest degradation in the country, the government of Nepal endorsed Forest Rules in 1978, which allowed local governance body to manage forest land (Ojha et al., 2009). In 1982 Decentralization Act introduced the 'user group' concept and in 1988 forest master plan emphasized the concept of forest users group with legal management rights (Poudel et al., 2015). The government of Nepal enacted the Forest Act in 1993 and forest regulation in 1995 which allows to flourish the community forest users group (CFUGs) all over the country (Pokharel et al., 2007).

In the beginning, community-based management strategy was adopted in the middle hills of Nepal as an experiment, which brought successful result, afterward evolved rapidly across the country over the years gaining endorsement among the policy makers and the local forest users. In order to restore degraded forest land and cope with massive deforestation, the Nepalese government formally adopted community based management approach in 1980s, which put emphasis on the devolution of management and governance right from government to local people (Gautam et al., 2004). Handing over a forest management and governance rights to the community led to overall improvement of environment as well as brought positive transformation in the livelihood of the local people (Nepal, 2006; Acharya, 2004).

Most of the past studies (e.g., Yadav et al., 2003; Gurung et al., 2013; Kanel et al., 2004; Adhikari et al., 2007) presented the status of the community forestry in forest management program, impact on livelihood of the community, challenges and opportunities among other. Both positive and negative aspects of community forestry program have been well documented comprehensively over the past years in various research papers. However, the literature on pushing factors for reforestation and restoration are relatively insufficient in telling the latest changes of forest outlook. There is a lack of comprehensive study on influencing factors on forestry rebound in the last two decades. Latest survey on the State of Nepalese forest produced by the government of Nepal has also failed to clearly mention the community forestry program as one of the major causing factors for afforestation in the country. This paper assesses the community forestry program as a key factor behind the successful change of forest outlook in the past decades. The forest survey of different time period did not indicate and discuss the factors of deforestation and afforestation. This paper argues that the cause factor for afforestation is the adoption of the community forestry program as a main strategy in the forestry policy. The impact of community management on change in local environmental condition was assessed. Both quantitative and qualitative data were collected to evaluate the role of community management on forest conservation, qualitative data were used to interpret the conditions of the forest.

Materials And Methodology:-

Data were collected through survey and informal interviews with the members of the CFUGs and experts for this study. This study was conducted in six representative districts namely Ilam, Nuwakot, Syangja, Palpa, Surkhet and Doti covering different parts of mid-hill region of Nepal. Mid-hills account 43% of total land area of the country, with the greatest and diversified ecosystem. Additionally, about 32% of the forests in Nepal are covered in the mid-Hills. This part has extended east to west of the country between the Himalayan range in the north and the Ganges River plain in the south with an altitude range between 1000 and 3000 meters (Shrestha et al., 1992). The topography of the mid-hill zone is generally mountainous, with combination of fertile farmland, forest, shrub and grassland.

In order to examine the status of forest under the community management, 10 sample CFUGs were randomly selected from a community for one-to-one interview and survey. In the sampled areas, the majority of the populations were engaged in agriculture and dependent on forest resources such as firewood, fodder, timber and other products to sustain their local livelihood. Data were collected through informal interviews, survey among the members of CFUGs in the year 2016. It was intended to select CFUGs from the different parts of the mid-hill so that

the impacts of community management all over the country could be assessed. The forest biodiversity information was collected through the informal interviews with the members of the CFUGs.

30 interviewed members of the CF were with 100% response rate. The interview was semi-structured, with closed and open ended questions. Experts were also interviewed to examine their opinions towards the performance of the community forestry program. A survey questionnaire was designed to assess the total environmental impact of the CF program on forest conservation. To compare before and after the CF intervention, three options were presented in the survey questionnaire. The three options were 'increased or improved condition', 'same as before' and 'decreased conditions', respectively. In addition, secondary data-based discussion is also presented on environmental impact of the CF program. This discussion also provides linkage of the present results to the other studies.

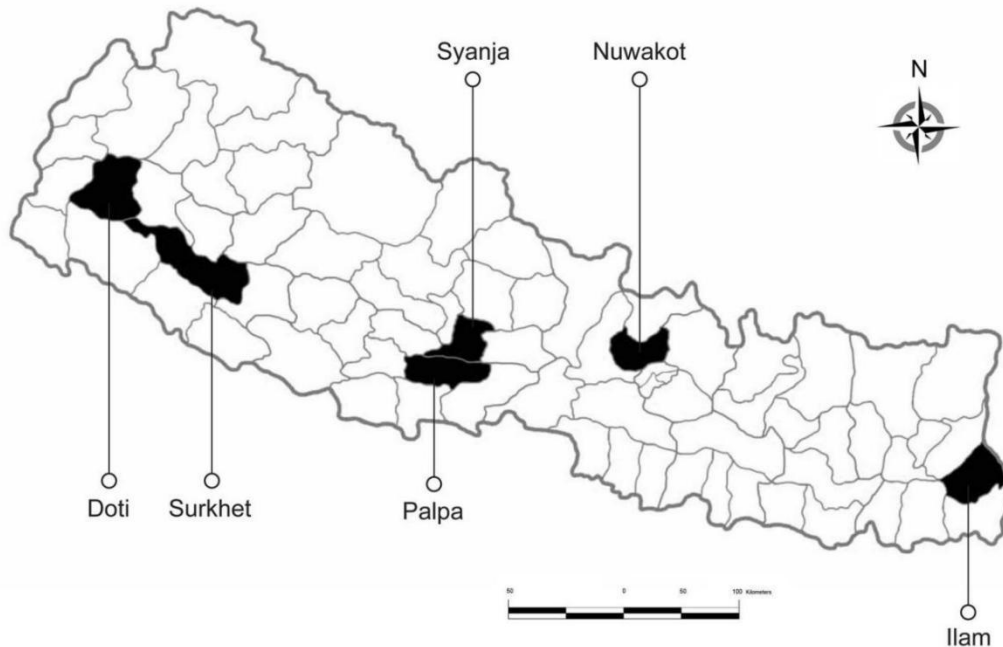

Figure 1:- The map of Nepal showing six study districts.

The main focus of the informal interview was to assess the quality of forest ecosystem before and after the implementation of community forestry program. The interview was designed to elicit forest conditions information from the users that mainly covered information on forest condition and health of biodiversity before and after CF intervention. In-depth interview is effective in collecting detailed information on significance of community management in conservation forest resources and evaluating the role in enhancing people's livelihood. The interview was designed to assess environmental impact of community management using multiple indicators. Similarly, this study also used the secondary data and reviewed literature to assess the contribution of community management. Existing literature and data related to community forestry were reviewed and analyzed to draw conclusions. The required secondary data were obtained from published reports, research papers, national data base and official records of the related agencies and stakeholders. The indicators of forest condition of this study include increasing shrub and greenery, improving biodiversity, reforestation of degraded land, availability of the resources, water resources conservation, soil erosion protection, effort to the conservation etc. The details about these conditions are presented in tables.

Limitations:-

Some of the data were collected through the informal interview and they were not quantifiable. Additionally, there is a lack of historic quantitative information on time — biodiversity for community forests. Small sample size was another limitation. However, given the objectives of the research, these limitations have not sacrificed the quality of the conclusions it has drawn. The implication of the limitations mentioned here suggests that there might be a room for further exploration or improvement on the subject matter of this study.

Results And Discussion:-

The present study revealed the improvement of forest conditions after the intervention of the Community Forestry program and CFUGs were effective in the environmental conservation. CFUGs are involved effectively in the activities of protecting the forest, managing the resources, cultivation, harvesting and benefits sharing, nursery production and planting as their own strategies and operational plan.

Deforestation in Nepal has a long history. Expansion of agricultural land, the growing demand for timber and the local dependency on forest firewood created pressure for deforestation in Nepal which lasted long (Pokharel et al., 2007). Conversion of forest to agriculture land, resource mismanagement, timber extraction for personal benefit by rulers, ineffective forest administration, unsustainable use of resources were the major causes for deforestation. The government of Nepal had already recognized alarming rate of deforestation, especially in mid-hills and Terai (lowland region in southern Nepal) in 1950s (Gautam et al., 2004). In 1964, forest and shrub covered area was 43.9% of the total land area of the country (WECS, 2010). By 1979 forest and shrub area slightly decreased to 42.7%. By the year of 1994, the total area of the forest and shrub further decreased to 39.6% of the total area of the country, while the area of forest alone was only 29% (DFRS, 1999). Over a period of 15 years (1979-1994) total forest area of the country was decreased by 23.68% or in the annual rate of 1.57% and shrub area was increased by 124.89% which was alarming rate of forest degradation over that particular period. The latest statistics show that forest and other wooded land has increased and reached 44.74%. It indicates that the forest area of the country has increased by 39.17% over a period of 20 years (1994-2014) by an annual rate of 1.95% and the area of other wooded land (shrub) decreased by 58.67% during the same period (DFRS, 2015). High decrease rate of other wooded land and increase rate of the forest area gives the clear picture of the afforestation over the period.

Table 1:- Changes in the forest and other wooded land (shrub) cover area (area in '000 ha) over time period in Nepal

	1964		1979		1994		2014		Percent change	
Type	Area (ha)	%	Area (ha)	%	Area (ha)	%	Area (ha)	%	1979-1994	1994-2014
Forest			5617	38.0	4269	29.0	5962	40.36	-23.68	+39.17
Shrub			690	4.7	1568	10.6	648	4.38	+125.53	-58.67
Total	6466	43.9	6307	42.7	5829	39.6	6610	44.74	-7.25	+12.97

Note: The total area of the Nepal is 147,181 km², percentage calculated accordingly. The data sources are WECS, LRMP, NFI and FRA.

The statistics presented in Table 1 show the changing scenario over the period of 15 years (1979-1994) when Nepal lost 1.3 million ha forest, while in the period of 1994 and 2014, the situation was reversed and 1.69 million ha forest covered area was increased.

Table 2: Number of Forest Users Group formation and Area under community forest users group

Year	Number	Area (ha)
1989	32	1281
1994	2756	112626
2005	13677	1134372
2011	15137	1340714
2016	18961	1752193

Data source: Ministry of Finance, Nepal

Table 1 and 2 depict a positive relationship of forest area rebound and CFUGs formation. Formally, community forestry program was launched in late 1980s, though practically community forest users groups were rapidly formed after 1990. In 1989, only 32 community forest users groups were established, managing only 1281 ha forest. By the year of 1994, formation of CFUGs became rapid and 2756 CF were established, managing 112626 ha by the year of 2005, the number of community forest users group extended to 13,667. By the year of 2011, the number of CFUGs increased to 15,137 managing 1,340,714 ha forest. It clearly shows that increasing number of the CFUGs across the country brings afforestation gradually. Not only forest covered area rebounded, number of stems/ha by stem diameter has also increased (Table 3), which indicate the enhancement of the forest quality. In 1960s, number of stems/ha by stem diameter was only 313, which reached 408 in 1994 and 429.93 in 2015. Similarly, carbon stock (t/ha) was 151 in 1960s which increased to 176.9 in 1994 and 176.95 in 2015.

Table 3:- Change in forest composition over time

Year	Number of Stems/ha by stem diameter	Carbon Stock (t/ha)
1964	313	151.0
1994	408	176.9
2015	429.93	176.95

Data Source: Department of Forest, Nepal .

**Figure 2:-** Changes in forest condition. Data source: MFSC, 2013

Studies have shown that there have been remarkable positive changes in community forests across the country. Changes in different dimensions of forest quality are presented in Figure 2. Figure 2 shows outstanding improvement in forest quality as a reflection of the management inputs. According to a study conducted by Ministry of Forest and Soil Conservation, since handover, 86% of CFUGs reported improvements of forest condition. Forest quality has been improved in terms of tree coverage area, tree density, species, and forest productivity, regeneration and bio-diversity. Those are the main indicators and criteria to determine the forest quality. 79.49% of CFUGs reported that tree coverage area increased after CF program intervention, only 14.01% reported that their tree coverage area has been decreased. Similarly, 87.43% CFUGs reported that forest productivity has been increased. CF program has positive effect on bio-diversity in the forests, it has helped to conserve and foster different kinds of plant species.

According to the respondents, forest was under the big threat of massive deforestation due to unsustainable use of resources in order to meet the demands for fuel wood, fodder, timber etc. before the CF program intervention. After the implementation of the program, apart from the improving forest conditions, forestry product supply and forestry income has also increased.

Table 4 describes ten community forests in the study area and provides the information regarding size, household number, forest types, forest condition and total years of forest management by communities. The investigated forests are small in size; therefore the produced forest products are not sufficient to meet the demands of local users. It was found that the condition of the forest that has been conserved for a longer period is good and has higher regeneration rate.

Table 4:- Attributes of community forest

Name of CFUG	District	Forest Area (ha)	No. of households	Years managing the forest actively	Forest Condition	Forest Type (dominant species)	Forest area per household (ha)
Thokre Firfire	Ilam	25	70	20	Good	Katus, Chilaune (<i>Castanopsis sp./schima wallichii</i>)	0.35
Choyatar	Ilam	150	170	20	Good	Pine (<i>Pinus roxburghii</i>)	0.88
Ramche Deurali	Nuwakot	17	65	21	Fair	Katus, Chilaune (<i>Castanopsis sp./schima wallichii</i>)	0.26
Salghari Silapatra	Nuwakot	37	350	16	Good	Sal (<i>Shorea robusta</i>)	0.10
Sallaghari	Syangja	27.75	27	10	Good	Katus–Chilaune (<i>Castanopsis sp./schima wallichii</i>)	1.02
Ramche	Palpa	99.7	302	24	Good	Sal (<i>Shorea robusta</i>)	0.33
Deuti Bajyei	Surkhet	749	1032	26	Fair	Sal (<i>Shorea robusta</i>)	0.72
Kalika	Surkhet	220.76	88	10	Fair	Sal (<i>Shorea robusta</i>)	2.50
Navadurga	Doti	200	73	15	Fair	Pine (<i>Pinus roxburghii</i>), Sal (<i>Shorea robusta</i>)	2.73
Ranipokhari	Doti	126.23	250	18	Good	Pine (<i>Pinus roxburghii</i>), Sal (<i>Shorea robusta</i>)	0.50

The entire sample CFUGs chosen for this study is implementing scientific forest management activities. CFUGs are promoting forest protection and plantation; prohibition of trees falling and wildlife hunting, preventing forest fire, control grazing, conserving soil and water and protecting forest from encroachment have been included in their operational management plans and programs. The primary objectives of forest managements set by all CFUGs are more or less similar to fulfilling the basic needs of forest products by using them in sustainable ways and protecting the forest resources. Income generation, conserving water sources, preventing soil erosion, maintaining greenery, protecting wildlife are the additional objectives of the CFUGs.

The activity of 'Godmel', 'Jhadifadne'¹ is an effective silvicultural practice carried out by CFUGs. This activity includes cleaning, weeding, thinning, pruning etc, which allows the favorable environment to the desired trees to establish, grow and eliminate unwanted trees and bush. Removal of shrub and unwanted wood could help to increase main crop or trees' productivity.

In six of the ten sampled community forests, the forest area per household is found to be less than national average (0.73 ha) ((Bista, Gurung, Karki, Shrestha, & Uprety, 2012). Most of the family in the sampled areas is engaged in the agriculture and dependent on forest for firewood, timber, fodder, leaf-litter etc to meet their daily requirements of cooking, infrastructure and building construction and feed to animals. Nevertheless, all studied community forests are not in the condition to supply full required forest products to the community. Generally, CFUGs distribute their forest products free of cost to the locals, therefore income of CFUGs is very low. Member household pays a very small amount as membership fee. According to them, deforestation took place exclusively before CF program intervention, and the forest condition in the studied community forests has improved since forest handover to the community from the government. The mixed forests were found in the study area, though Sal (*Shorea robusta*) is a dominant species. Most of the sampled forests are covered with Sal (*Shorea robusta*) which is commercially high valued timber species. The main aim of the community forestry program of Nepal is to improve the forest condition through the efficient management and fulfill the demand of forest products of the community as well as livelihood improvement of the poor people. The sampled communities have succeeded in improving forest condition in a sustainable way and restore the degraded forests. Reforestation is one of the major indicators to evaluate community forestry program and most of the CFUGs have achieved this goal impressively.

¹cleaning, pruning, thinning and weeding operations

The handing over management rights of forest encouraged community participation to conserve the resources and also assured the livelihood improvement through benefits generation from forest. A large number of small and medium sized trees is growing up in the sampled area because most of them were recently handed over and communities have been conserving them very well. Seven out of the 10 sampled CFUGs underwent plantation after possession of management rights of the forest in the degraded land. Since the establishment of CFUGs, no forest fire incidents have happened according to all 10 sample CFUGs which is a strong indicator of CFUGs' contribution in forest conservation and protection. Previously forest fire was the main problem. In all the CFUGs studied, the forest condition is improving and 'improving forest condition' is their most successful indicator to evaluate entire community forestry program in Nepal. Restoration of the forest from declined stage and overall indicators of the forest show that CF program is undoubtedly successful.

Data presented in Table 5 indicates that tree coverage area has been increased since the program implementation. Nine of the ten CFUGs studied clearly answered that tree coverage area has been increased and one answered that no changes have occurred. In case of regeneration of plant (seedlings and sapling), six of the 10 CFUGs have done well and four have average characteristics meaning that the forests are sustainable.

Table 5:- Indicators after intervention of community forestry program

Name of Community forest	Area covered by tree	Tree density	Tree Species	Productivity	Biodiversity	Road access to forest	Plantation	Regeneration
ThokreFirfire	Increased	Increased	No Change	Increased	Increased	Yes	No	Good
Choyatar	Increased	Increased	No Change	Increased	Increased	No	Yes (Regular)	Good
RamcheDeurali	Increased	Increased	Increased	Increased	Increased	Yes	No	Average
SalghariSilapatra	Increased	Increased	No Change	Increased	Increased	Yes	Yes	Average
Sallaghari	Increased	Increased	Increased	Increased	Increased	No	Yes(2 times)	Good
Ramche	Increased	Increased	Increased	Increased	No Change	Yes	Yes	Average
DeutiBajyei	Increased	Increased	Increased	Increased	Increased	No	Yes	Good
Kalika	No Change	Increased	Increased	Increased	Increased	No	No	Average
Navadurga	Increased	Increased	Increased	No Change	Increased	No	Yes (regular)	Good
Ranipokhari	Increased	Increased	No Change	No Change	Increased	Yes	Yes (regular)	Good

After handing over management rights to the community (as a reflection of management input), most of CFUGs regulated their forests for regeneration and adopted sustainable forest management strategies. They made effective plans and procedures themselves, implemented the plans rigorously and moved towards successful sustainable management. Amongst the CFUGs studied, tree density and productivity of the forest has been increased in all forests after adaptation of community forestry. The improvement of productivity brings many benefits to community that can be distributed for their livelihood support. As shown in Table 5 most of the CFUGs (seven among the 10) carried out plantation as a priority activity, which indicates that most of the community reforested in degraded land in a planned way. Although 3 community forests are natural forests, CFUGs conserved and managed well.

Most of the forest in Nepal regenerates very easily from seed and roots. The plantation is subjected to less priority in recent years as natural regeneration is sufficient to allow for forest restoration. According to the respondents, the harvesting system is sustainable now, which was unsustainable before the implementation of CF. After intervention of the program, tree species such as, Shorearobusta (sal), pinus sp. (sallo), Schimawallichii (chilaune),

Dalbergiasissoo (sisau) etc have been increased notably in the all CFUGs. As depicted in Table 5, about 27% respondents replied that the status of prioritized species is in good condition after intervention of the program, and 40% replied that the condition is improving. The research revealed that besides forest condition's improvement, the level of awareness of forest protection among the users has also increased after intervention of the program. Similarly, 40% of the respondents replied that the conservation efforts are good, and 23.33% responded that situation is improving whereas 23.33% responded that the conservation efforts of the CFUGs were poor.

After the program intervention, many of the CFUGs put efforts into several activities and behaviors that contributed to the forest conservation. To improve the ecosystem services, the communities focused on planning of the activities for restoration of degraded land, water resources protection, soil erosion and landslide control, biodiversity protection and greenery promotion. According to the respondents, the restoration of the degraded land was the most important issue for them. Then after, water resources conservation, biodiversity protection, soil erosion control, greenery promotion are the other factors of conservation.

Table 6:- Users perception about forest

	Good	Improving	Satisfactory	Poor
Status of prioritized species	8 (26.66%)	12(%)	7(23.33%)	3 (10%)
Conservation efforts	12 (40%)	7(23.33%)	4(13.33%)	7(23.33%)

Despite effective conservation efforts and significant improvement in the forest condition in the country, forest products are not sufficient to meet growing demands of the community. Most of the CFs studied are not in the situation to fulfill the forest product needs of the users and the revenue generation is also low. Forests do not generate enough revenue to support livelihood of the local people. CFUGs are very sensible about sustainable use of forest resources which ensures that use of resources are less than the rate of regeneration. Particularly, forests are unable to meet the demands for timber, mainly due to the immaturity of the forests to produce large amount of timber.

Most of users do not have technical knowledge about harvesting and silvicultural practices among other. They do not have technical human resource as well. Their management model somehow tends to be traditional. One of the underlying problems of the CF is most of the CFUGs adopted a conserve-oriented approach rather than taking economic benefit for the community. They harvested few forest products mainly to restore and protect the forest products. Also, the study found that most of the users are unaware of the financial opportunity from the Non timber forest products (NTFPs) to the community forest. Despite having a huge potential of commercial value, NTFPs are being ignored. Either they are selling the NTFPs in cheap price or the products are becoming useless due to no-market accessibility although, in recent years many CFUGs have shown concern towards the NTFPs and high commercial value products such as bamboo, lantusemblica (amla), cardamom, broom grass (amriso) etc. CFUGs prioritized tree species of high commercial value as required, established nursery and carried out plantation. For example, DeutiBajyei CFUGs planted Sisau (Dalbergiasissoo) Khayar (Senegalia catechu) in 47.5 ha because of their high commercial value.

There are still many challenges for community forestry program towards making it more successful. CF of Nepal is based on protection approach rather than market oriented approach. CFUGs, however, are not far from criticism over few problems regarding representation and benefit sharing.

As depicted in the Figure 3, the majority of the CFUGs member responded that forest products' availability has been increased after formation of the CF. The study examined the member's perception regarding forest condition and outcomes of the CFUGs efforts. They answered that the CF program was raising their living standards and easing the livelihood. Local people use the forest for many purposes such as fulfilling their fuel wood needs for cooking and heating. Timber and poles are highly valued as commercial forest products, which are used for house and other building construction and making agriculture tools. In recent years, seven of the 10 studied CFUGs identified some non-timber forest products as commercial products such as fruits, vegetable, herbs etc. All the studied community forests supply timber to the users. Agriculture and livestock are the integral part of the household livelihood of the rural Nepal. So, there is huge demand for grass, leaf-fodder and leaf-litter. Leaf-litter is used for animal bedding and also used for compost fertilizer making. Particularly, users responded that fire wood, grass/leaf-fodder and leaf-litter have been increased significantly, whereas herbs and non-timber forest products have not been increased in the similar ways.

Figure 3:- Change in availability of forest products

CFUGs are legally autonomous to make decisions regarding the management action. Nepal made evident innovation in people's participation in forest governance practices (Ojha et al., 2008). Forest resources belong to the CFUGs though the property (land) right belongs to the state. Most of the CFUGs selected for this study have clear procedure for operation and benefit allocation of the forest resources. Ideally, CFUGs practice the participatory approach and involve the women, marginalized group and poor in the decision making process (Bijaya et al., 2016; Pokharel et al., 2007). However, there have been some criticisms that CFUGs are not inclusive and elite group dominate in the decision making and benefit sharing process (Yadav et al., 2003; Bista et al., 2012; Pokharel and Nurse, 2004). The study found that CFUGs practice the democratic norms to elect the executive body for operation and management of the CF. It is a strong institution for social inclusion and supporting local democracy. CF program is considered as a vehicle for wider social-economic development of the community which helps for the improvement of community development such as school, drinking water, roads, irrigation etc (Yadav et al., 2003). Most of CFUGs contribute to build social infrastructure. Apart from financial support, CFUGs contribute in raising social awareness on health, education, and forest protection in local level.

The major gain from community forest is quality improvement of forest resources and improving the livelihood of the people. Many researchers (e.g., Pandit et al., 2011; Adhikari et al., 2007; Bijaya et al., 2016; Yadav et al., 2003), CFUGs and Government officials agree that there have been significant positive changes in forest quality since community forestry was introduced. Not only ecological benefit, community forestry program has contributed to improve the livelihood of the local people. According to in-depth national survey conducted by Nepalese Ministry of Forests and Soil Conservation, households in 137 CFUGs across the country mentioned that community managed forests have increased incomes of the rural poor, women and Dalits (marginalized group) (Pandey et al., 2015).

The study found that in CFUG, the community develops the management rules and gets approval from the District Forest Office. They do occasional planting, undergo silvicultural operations on a regular basis. In community forest, harvesting of timber is restricted, harvesting of grasses, leaf litter, fallen wood are generally permitted as per rules and regulations. Time to time CFUGs extraction and distribution or sale of the timber and non-timber forest products are CFUGs' major benefit sharing activities. Local people monitor the forest as a volunteer on a rota basis. CFUGs do not have rights to sell or transfer the land itself because property rights are protected by the governments/state.

After the intervention of the community forestry program, the forest conditions have improved. Similarly, water resources, biodiversity, forest productivity, greenery have also improved (Pokharel et al., 2007). Communities are focused on creation of good atmosphere to enhance the ecosystem services. Despite low commercial benefit from the forest, livelihood of the users has improved gradually as they have access to fodder for their cattle, timber for making home and fire wood for cooking and heating.

Conclusions:-

Community forestry is an appropriate participatory resource management approach to conserving and utilizing forest in a sustainable way. This program is successful in restoration of degraded land, improving forest condition, conserving biodiversity and supporting livelihood of the local community by providing forest products. After two decades of successful management practice by local communities, Nepal gets rapid growth on forest conservation.

In Nepal most of the communities are practicing passive management system that brings few outcomes due to lack of broad knowledge and management skills. Additionally, most of the CFUGs are not aware of potential of their forests. Shift from protection-oriented to market-oriented approach is another major issue that needs to be addressed. Due to conservation approach, revenue generation of the forest is very low and livelihood support from the forest is also less than expected. Benefits for the local users are equally important as conservation of the resources. It has been reported that elite domination on decision making process has suppressed the equitable benefit sharing and social justice, this issue needs to be addressed immediately. Community forest program is likely to be beneficial to mitigation and adaptation to address the consequences of climate change. Vegetation and greenery of the forest has increased after implementing the community forestry program that contributed to the increase of carbon stock and carbon sequestration.

CFUGs are conserving their forests and using resources in a sustainable way and improving their livelihood in the mid hills of Nepal. In nutshell, this study concludes that the CF program brought significant changes to the outlook of Nepalese forestry sector by reversing the previous tendency of massive forest degradation that has resulted into preventing negative consequences. The program has improved forest condition in terms of greenery and tree coverage area and contributed to the livelihood of the people in a sustainable manner. However, it has been recommended that market-oriented approach would help community to get more economic benefit than existing approach. Community led initiative in Nepal has set best example in forest conservation and this experience can be explored by other countries as well.

Acknowledgments:-

We are thankful to the Bachchu BK, Prabhat Bhattarai, Nawadeep Ajnabee, Kamal Basnet, Santosh Raj, Tufan Neupane for their valued helps in field research. We also express our sincere gratitude to Sanot Adhikari and Ramesh Bhusal and other experts for their highly valuable information and feedback.

Camel milk, Cow milk, Metals, Redox titration, FAAS and Flame photometer.

Abstract

This study includes the determination of the contents of some of the major components of camel's milk; and to compare them with their counterparts in cow's milk. The samples were analyzed chemically to determine the percentage of Protein, Fat, Total Solids (TS), Solid Non Fat (SNF), Lactose and Ash contents. Also included in the present study, is a comparative investigation of vitamin C (ascorbic acid) concentrations in samples of both types of milk by redox titration using iodine solution. For essential metals the raw milk sample was digested by wet digestion system, and then the metals (Na and K) were determined by flame photometer in the solutions of digested samples while, (Ca and Mg) were determined directly by flame atomic absorption spectrophotometer (FAAS). The investigation showed that Protein, Fat, Total Solid, Solid Non Fat; Lactose and Ash content were low in camel milk as compared to cow milk. Also, the major metals were higher in cow milk, but ascorbic acid content is high in camel's milk.

Introduction:-

Milk is an excellent source of most essential minerals for human. It is part of a healthy diet. The composition of the milk of various animal species differs, but in every case it has a high priority in human nutrition ⁽¹⁾. Milk also contains antibodies which protect the young mammal against infection ⁽²⁾. Cow's milk has long been considered a highly nutritious and valuable human food and is consumed by millions daily in variety of products one can also use milk from goats and camels.

Chemically milk is described as an emulsion of fat in watery solution of sugar, mineral salts with protein in a colloidal suspension ⁽³⁾.

Sudan possesses large wealth of animal livestock of which camels constitute more than three million heads raised in north of 12° N latitude ⁽⁴⁾.

There are several studies have reported the essential components in various types of animal milk.

The objective of this study is to compare nutritive ingredients in cow and camel's milk available for Al Hajj Yusuf area consumers, in Khartoum state (Sudan) . These include determination of some of chemical composition; the major metals include Sodium , Potassium , Magnesium and Calcium, also determination of ascorbic acid by redox titration.

Experimental Procedure:-

Sampling:-

The row milk samples were collected at milking from cows and transferred into clean bottles (250 cm³), and stored in ice tank, then transported to analysis.

Chemical Analysis:-

A chemical constituent as Fat % was determined by Gerber method and the protein % was determined by Kjeldahl method described by AOAC (1990)⁽¹⁵⁾. Similarly, total solids %, ash %, solid non fat and lactose% also described by AOAC (1990).

Fat content:-

The Gerber method was used to determine fat content in milk. In clean dry Gerber tube Sulphuric acid (10 cm³) was poured into Gerber tube and then 10.94mL of milk sample was slowly added into Gerber tube followed by 1mL of amyl alcohol. The contents of Gerber tube were thoroughly mixed till no white particles could be seen. The Gerber tube was centrifuged at 1100 rpm for 5 minutes. Gerber tube was transferred to a water bath at 65°C for at least 3 minutes and the percent fat was recorded directly from the Gerber tube scale.

Total solid:-

The total solid contents were determined according to the modified method of AOAC (1990), 5 cm³ ml of the milk samples were weighed in dry clean flat bottomed aluminum dish and heated on a steam bath for 10-15 minutes .The dishes were placed in an oven at 100° C for 3 hour. Then was cooled in desiccators and weighed quickly. Weigh was repeated until the difference between the two reading was <0.1mg.the total solid (TS) contents were calculated as fallow:

$$T.S\% = W1/W2 \times 100$$

W1=Weight of sample after drying

W2=Weight of sample before drying

Ash content:-

he ash content was determined according to the method described in the AOAC (1990); 5 cm³ of the sample were weighed in crucible and evaporated to dryness on a steam bath. The crucibles were then placed in muffle furnace at 550-600°C until ashes were carbons free (2-3hour), and then crucible were cooled in a desiccators and weighed. The ash content was calculated using the following equation:

Ash % = $W1/W \times 100$

W1=weight of ash

W=weight of sample

Protein content:-

The protein content of milk samples was determined according to Kjeldahl method as described by AOAC (1990). 10 cm³ of each milk samples were poured into clean dry Kjeldahl flask. Kjeldahl tablets of CuSO₄ and concentrated H₂SO₄ (25 cm³) were added to the flasks. The flasks were heated until clean solution were obtained (2-3hours) and left for another 30 min. the flask were then removed and allowed to cool.

The digested milk samples were poured into volumetric flask (100 cm³) and dilute with distilled water. Then 15 cm³ of 40%NaOH was added to flask and content of flask was distilled. The distillate was received in conical flask (100 cm³) containing 10 cm³ of 2% boric acid plus three drops of indicator (bromocresol green+ phenolphthalein red)

The distillation was continued until the volume in the flasks was 75 cm³ then the flasks were removed from distillatory. The distillate was then titrated with 0.1 HCL until the end point (red colour) was obtained.

The protein content was calculated as follows:

$$N\% = T \times 0.1 \times 0.014 \times 100 / W$$

$$P\% = N\% \times 6.38$$

T=reading of titration

W=weight of original sample

N=total nitrogen

P=total protein

Lactose content:-

The Lactose content was determined by subtracting the sum of protein%, fat% and ash% from the total solid %. Fat from total solids

$$\text{Lactose\%} = \text{total solid \%} - (\text{protein\%} + \text{fat\%} + \text{ash \%})$$

Solid Non Fat (SNF):

The Solid non fat was determined by subtracting Fat from total solids.

$$\text{SNF\%} = \text{T.S\%} - \text{fat\%}$$

Determination of Concentration of Vitamin C (Ascorbic acid):

The vitamin C (Ascorbic acid) was determined in milk by redox titration⁽¹⁶⁾.

0.005 mol /L Iodine and 0.5% starch indicator solutions were prepared.

Preparation of milk samples:

20 cm³ of milk solution were transferred into a 250 cm³ conical flask and then added about 150 cm³ of distilled water and 1 cm³ of starch indicator solution. Then titrated against 0.005 mol/L iodine solution.

Determination of the major metal:

Calcium and Magnesium metals were analysed by flame atomic absorption (FAAS)⁽⁹⁾, while the Sodium and Potassium measured by flame photometer in each samples of milk.

All glassware was washed with detergent and water. After being rinsed with water for several times, it was soaked in 20% HNO₃ (v/v) for 24 h, and Then were soaked again in 20% HNO₃ (v/v) for 24 h. The glassware was then rinsed several times with deionized water, and dried. Deionized water obtained from a Milli-Q system, Hydrochloric acid (37%), Nitric acid (65%), and Hydrogen peroxide (30%) analytical grade (DFCL-Hindi).

Sample Digestion and Preparation of Analytes Solution for AAS and flame photometer:

The milk sample needs to be brought into clear solution to eliminate the organic part of milk, for analysis by the Atomic Absorption Spectrometer and flame photometer. For this reason the milk sample was first digested with chemicals^(9,13) where the organic matrix of milk was destroyed and left the element into a clear solution. Wet digestion method (i.e. digestion with nitric, sulfuric and perchloric acids) has been used in the present study⁽¹³⁾.

Known volume of milk (100ml) was evaporated dryness. About 1 gm sample was transferred into a 125 ml conical flask. A 10 ml HCl-H₂O₂ [1 + 1] mixture was added to it, and the flask was covered with a watch glass. The sample

was heated on a hot plate at 100°C for about 2 h, bringing it to a gentle boil. The digested solution was filtered into a 100 ml volumetric flask through 125 mm filter paper, and diluted with deionized water⁽¹⁷⁾.

Determination of Ca and Mg by Flame- AAS:

Instrumentation:-

A Shimadzu analyst 6800 model (Japan) flame atomic absorption spectrometer equipped with hollow cathode lamps was used for the analysis. The following Instrumental conditions for the determinations of metals in raw camel and cow's milk are given in Table (1).

Table (1):- Operation condition for determination Ca and Mg by FAAS:

<i>Operation condition</i>	<i>Ca</i>	<i>Mg</i>
Lamp current flow rate [mA]	10	8
Wavelength [nm]	422.7	285.2
Slit width [nm]	0.5	0.5
Fuel gas flow rate [L/min]	2.0	1.8
Flame type	Air-C ₂ H ₂	Air-C ₂ H ₂
Burner height	7	7

Determination of Sodium and Potassium by Flame Photometry:-

Instrumentation:-

JENWAY model PFP7 (UK) flame photometer for the determination of sodium and potassium concentrations was used (table 6).

Result and discussion:-

Results of chemical composition of camel and cow's milk samples which were collected from farms in Al Hajj Yusuf city were showed in Table (2). The means of Fat, protein, lactose, T.S, SNF and ash were in camel's milk [2.9, 3.09, 2.42, 9.52, 6.62 and 0.6 %, respectively] lower than those detected with cow's milk [4, 3.89, 3.5, 12.3, 8.3 and 0.7 %, respectively].

Table (2):- chemical composition of camel and cow's milk (%):

	Fat%	Protein%	Lactose%	Total solid%	Solid non fat%	Ash%
Camel milk	2.90±0.13	3.09±0.03	2.42±0.11	9.52±0.12	6.62±0.02	0.6±0.00
Cow milk	4.00±0.07	3.89±0.04	3.50±0.01	12.3±0.05	8.3±0.03	0.7±0.02

The Table (2) indicated the chemical content of cow milk is higher than camel milk. Cow's milk seems thicker than camel's milk because it generally contained higher total solids than camel's milk; fat content of cow's milk is higher than camel's milk. Because of its high fat content, cow's milk had considerably higher energy value than camel's milk. These results are agreement with those values reported by Ghada Z. A. Soliman⁽¹⁾ and Sabahelkhier et.al.⁽³⁾. these results are comparison with other results shown in table (3).

Table (3):- comparison of milk chemical content with other reported content:

Animal milk	Fat%	Protein%	Lactose%	Total solid%	Solid non fat%	Ash%	Reference
Camel milk	3.6	2.59	4.30	11.7	-	0.75	3
	2.35	2.06	4.41	9.78	7.45	0.94	4
	3.1	4.0	5.6	-	-	0.8	7
	4.85, 3.46	2.32, 2.58	-	11.29, 9.81	-	1.30, 0.87	9
	2.9- 5.38	3.01- 4.0	3.36- 5.8	-	7.01- 10.36	0.6- 0.8	10
	2.9-5.5	2.5-4.5	2.9-5.8	-	8.9-14.3	0.35-0.95	11
Cow milk	3.44-4.96	2.98-3.87	4.08-5.00	11.23-14.26	-	0.40-0.8	2
	3.75	3.40	4.80	12.8	-	0.71	3
	3.20	3.20	5.00	12.10	-	0.65	6
	4.6	3.4	4.9	-	-	0.7	7
	3.6	3.20	4.70	-	9.00	0.7	15

Vitamin C or ascorbic acid is a water soluble antioxidant that plays a vital role in protecting the body from infection and disease. It is not synthesized by the human body.

The content of vitamin C in raw camel and cow milk was studied; it showed in Table (4), the level of ascorbic acid in camel milk is higher than the cow milk; it plays a major part in the medicinal reputation of camel milk. Ascorbic acid is highly unstable especially with temperature change. these result for camel milk are support with given by FARAH et.al⁽⁷⁾ (26.2-61.1 mg/L) and G. Konuspayeva et.al⁽⁸⁾ (15-435mg/L), but different from Mohamed H.E. et al⁽¹¹⁾ had determined according three breeds of camels and affected by the stage of lactation.

In this study vitamin C was determined in row milk by different method from other reports (redox titration) whereas the other authors as Farah et al.⁽⁷⁾ had analyzed frozen milk by HPLC (High Performance Liquid Chromatography) and G.Konuspayeva et.al⁽⁸⁾ were quantified vitamin C on fresh milk by the colorimetric method using 2,6-dichlorophenolindophenol [2,6-DIPh]. Therefore, the observed differences in vitamin C milk concentration could be partly explained by the analytical conditions, and probably also by the analytical methods used.

Table (4):- The vitamin C of camel and cow's milk

Animal milk	Vitamin C mg/100ml
Camel milk	18.4±2.11
Cow milk	5.3±1.43

The results of metals analysis of camel and cow's milk are given in Table (5) and table (6). The concentration levels of major metal in row cow milk observed in this study are higher than those observed in raw camel milk.

Table (5):- Analytical characteristic for determination Ca and Mg by FAAS:

Parameter	Ca	Mg
Regression line	$y = 0.257x + 0.030$	$y = 0.276x + 0.001$
r^2 correlation coefficient	0.99	0.99
SD Standard Deviation	0.025	0.0026
Slope ± SD	0.0045	0.0043
intercept± SD	0.022	0.0027
LOD (Limit of detection) mg/ml	0.33	0.015

Table (6):- the major metals of camel and cow's milks (ppm):

Metal	Ca	Mg	Na	K
Camel milk	73.4	6.54	13.25	135
Cow milk	128.28	12.96	51	149

The differences in the values of nutritive contents obtained in this study compared to their analogues in other studies can be attributed to differences in bred species, feeding condition, hygienic follow up, water availability, and seasons of the year. The camel milk didn't coagulate after 2 months of standing, at room temperature and that shaking was enough to bring the milk back into its original form.

Conclusion:-

There are differences in constituents of camel's milk compared to cow's milk. The most important property of camel milk is the high value of vitamin C. This high value contributes to a consideration that camel milk has a stimulating effect on the human immune system, provides sufficient vitamin C for people living in the desert, and presents normal acidity unfavorable for bacteria growth. The camel milk can be kept for longer periods than cow milk. Raw cow milk becomes sour after 2 days. Raw camel milk is richer vitamin C, so the camel milk is very much more nutritive and hygienic for human body.

Induced Hypertension, 2D
Echocardiography

Abstract

Introduction: Pregnancy related increased preload alters the diastolic properties of the left ventricle which have negative effects on maternal health. Scarcity of data exist on the diastolic properties of left ventricle in pregnancy induced hypertension.

Objectives: To evaluate the Left ventricular diastolic dysfunction in pregnancy induced hypertension and its comparison with normotensive pregnant females using standard 2D echocardiography and Doppler studies.

Methods: This is a prospective study done in Department of Cardiology, KLES Dr Prabhakar Kore Hospital, Belagavi, India. The study population consisted of 100 hypertensive(H) and 100 normotensive(N) pregnant females which were evaluated by 2D Echocardiography and Doppler parameters for diastolic dysfunction of Left ventricle.

Diastolic parameters studied were mitral valve E wave, A wave, E/A ratio, isovolumetric relaxation time (IVRT), E deceleration time, Deceleration slope, pulmonary vein systolic (PVs), diastolic (PVd) and its ratio, E wave velocity time integral, A wave velocity time integral and tissue Doppler study of the mitral valve annulus.

Results : Majority of the women in group N(94%) had normal diastolic function that is grade 0, compared to group H(56%).

This difference was statistically significant ($p < 0.001$).

Most significantly associated characteristics with diastolic dysfunction included MV: E/E' ($p = 0.004$), IVRT ($p < 0.001$), Deceleration Slope ($p < 0.001$), PVa(<0.001) and PVs(0.015).

Mean grade of diastolic dysfunction in hypertensives was significantly high compared to normotensives ($p < 0.001$).

Conclusions: This study concludes that there is significant incidence of diastolic dysfunction in pregnancy induced hypertension as compared to normotensive Asian Indian females.

LV inflow E/E', Deceleration slope, IVRT and Pulmonary vein flow velocities are most significant echocardiographic characteristic associated with diastolic dysfunction in pregnancy induced hypertension.

Introduction:-

Pregnancy introduces a plethora of hemodynamic challenges to the maternal cardiovascular system which is further intensified in pregnancy induced hypertension. Pregnancy induced hypertension includes gestational hypertension, pre-eclampsia, and eclampsia. It is associated with increased maternal morbidity and mortality. The incidence of hypertensive disorders ranges from 2-8% of all pregnancies and contributes to 9% of maternal mortality in Asia and 12% in India.^{1,2}

Pre-eclampsia involves multiple systems in mother and can lead to fetal mortality and morbidity secondary to uteroplacental insufficiency.³

Gestational hypertension is diagnosed when the BP exceeds 140/90 in the absence of proteinuria or pathologic edema in a previously normotensive female at or after 20 weeks of gestation. Pre-eclampsia is considered severe when proteinuria exceeds 4gm/24 hours, blood pressure is or more than 160/110 and/or severe headache, visual disturbances or epigastric pain is noted. Eclampsia is the development of generalized seizures in a patient of pre-eclampsia.¹ The incidence in primigravidae is about 10% and in multigravidae about 5%.⁴

Pregnancy induced hypertension increases cardiopulmonary morbidity and has a higher prevalence of myocardial contraction band necrosis at autopsy suggesting that pre-eclampsia may be associated with potentially significant myocardial damage.⁵

During normal hemodynamic adaptations there is some degree of diastolic dysfunction even in normotensive pregnancy which gets further exaggerated in pre-eclampsia leading to increased cardiovascular morbidity and mortality.^{6,7,8} Normal diastolic function allows adequate filling of ventricles during rest and exercise without an abnormal increase in filling pressures. Initial diastolic dysfunction is impaired relaxation and with further progression of disease, there is mild to moderate increase in left atrial pressure and the mitral inflow velocity pattern appears similar to a normal filling pattern (pseudo normalization). However with further progression of the disease, the pattern becomes restrictive and finally irreversible. Doppler echocardiography is an excellent and routinely used non-invasive tool to assess the diastolic function of the heart.

This study is designed to find out the prevalence of diastolic dysfunction in pregnancy induced hypertension as compared to normotensive pregnant women by 2D Echocardiography and Doppler indices.

Methods:-

A case control study was performed between January 2015 and January 2016 in the Department of Cardiology, KLEs Dr Prabhakar Kore Hospital and Medical Research Centre, Belagavi. 100 singleton pregnant women with gestational hypertension, were enrolled for the study during the third trimester of pregnancy and were matched with 100 controls. Gestational hypertension was diagnosed according to Davey and MacGillivray.⁹ For each patient with gestational hypertension, a normotensive woman was matched. Approval of the University Ethics Committee was obtained, and written informed consent was collected from all patients.

Exclusion criteria included the following: undetermined gestational age, history of heart disease, undetermined development of hypertension, previously on antihypertensive treatment, and comorbidities namely diabetes, renal failure, anaemia and not in sinus rhythm. Blood pressure was measured from right arm in supine position.

Echocardiographic evaluation:-

2D Echo and Doppler data were obtained in patients in left lateral position with a 2.0 to 80MHz transducer interfaced with a commercially available echocardiographic machine (Phillips IE33). Hypertensive patients were studied prior to initiation of treatment. Severity and grading of diastolic dysfunction was done by calculating Doppler

indices namely transmitral and pulmonary venous flow patterns recorded in the apical 4-chamber view. Mitral flow velocities were detected by placing the sample volume between the tips of the mitral leaflets.

The following variables were measured:

1. Peak flow velocity in early diastole (E wave) and during atrial contraction (A wave);
2. Peak E/A ratio;
3. E- and A-wave time velocity integrals (E-VTI, A-VTI);
4. Deceleration time of the E wave (DT); and
5. Left ventricular isovolumetric relaxation time (IVRT).
6. Pulmonary venous flow velocities namely during ventricular systole (PVs) and its time-velocity integral (PVs-VTI); peak pulmonary venous flow velocity during ventricular diastole (PVd) and its time-velocity integral (PVd-VTI); peak pulmonary venous flow velocity at atrial contraction (PVa) and its time-velocity integral (PVa-VTI); and the duration of the PVa (dPVa).

Statistical Analysis:-

Data was analysed using SPSS statistical software version 20.0 The categorical data was expressed as rates, ratios and proportions and comparison was done using either Chi-square test or Fisher's exact test. The continuous data was expressed as mean \pm standard deviation (SD) and comparison was done using independent sample 't' test. A probability value ('p' value) of less than or equal to 0.05 was considered as statistically significant. Observer bias was avoided by taking in measurements by 2 different observers from random selected patient data recordings.

Results:-

The present study included a total of 200 pregnant women that is, 100 women with hypertension (Group H) and 100 women with normal pregnancy (Group N). The comparison of patient and echocardiographic characteristics of the study population is tabulated in Table 1.

Table 1:- Patient and Echocardiographic characteristics of the study population

Characteristics	Group N (n=100)		Group H (n=100)		p value
	Mean	SD	Mean	SD	
Age	23.06	2.92	23.48	2.38	0.032
Gestational age (weeks)	35.80	0.57	35.78	0.51	0.044
MV:E	5.60	1.80	8.11	9.05	0.060
MV: A	57.70	25.04	56.75	27.93	0.858
MV: E/A	1.25	1.48	1.39	1.58	0.643
MV:E'	7.23	3.01	8.53	4.55	0.096
MV:A'	9.99	5.53	9.36	3.27	0.491
MV:E/E'	33.41	54.32	10.02	25.29	0.004
IVRT	144.02	20.15	119.96	31.91	<0.001
DT	130.88	29.04	173.24	152.68	0.059
DS	294.73	166.10	487.92	208.62	<0.001
PVs	43.30	13.38	50.24	14.52	0.015
PVd	43.98	12.45	46.64	13.85	0.315
PVa	31.58	8.00	40.52	11.31	<0.001
PVs/PVd	1.12	0.43	1.16	0.38	0.591
Systolic Blood Pressure	121.88	5.51	140.16	12.47	<0.001
Diastole Blood Pressure	79.70	9.40	86.00	7.44	<0.001

It was observed that, the mean maternal age and gestational age were comparable in both the groups ($p < 0.05$). Systolic ($p < 0.001$) and diastolic ($p < 0.001$) blood pressure was significantly high in group H compared to group N. Amongst all the Doppler characteristics MV: E/E' ($p = 0.004$), IVRT ($p < 0.001$), DS ($p < 0.001$), PVs ($p = 0.015$) and PVa ($p < 0.001$) were significantly higher in Group H when compared to Group N.

On the basis of the above mentioned Doppler characteristics the grade of diastolic dysfunction was evaluated. In the present study majority of the women in group N had normal diastolic function that is grade 0 in 94% compared to 56% in group H. This difference was statistically highly significant ($p < 0.001$). (Table 2)

Table 2:- Distribution of the study population according to Grade of diastolic dysfunction

Grade of Diastolic dysfunction	Group N (n=100)		Group H (n=100)		χ^2	p value
	No.	%	No.	%		
0	94	94.00	56	56.00	19.379	<0.001
1	6	6.00	40	40.00		
2	0	0.00	4	4.00		
Total	100	100.00	100	100.00		

Discussion:-

Pregnancy induced hypertension is characterized by progressive hypertension during gestation and may be associated with pathological edema and proteinuria. It complicates 2-8% of pregnancies.^{1,2}

Pregnancy induced hypertension has a placental pathogenesis with acute onset of cardiovascular manifestations secondary to generalized endothelial dysfunction and vasospasm resulting in hypertension and multi-organ hypoperfusion. The major scientific societies provide different criteria for the diagnosis of pregnancy induced hypertension. Common to all is new-onset hypertension (≥ 140 mm Hg systolic blood pressure [SBP] or ≥ 90 mm Hg diastolic blood pressure [DBP]) arising after 20 weeks of gestation and complete resolution within 12 weeks postpartum. The term pre-eclampsia and eclampsia indicates presence of proteinuria and generalized tonic clonic seizures associated with hypertension respectively. It is one of the leading causes of maternal morbidity and mortality worldwide, and delay in the treatment of severe hypertension and diagnosis of pre-eclampsia complications contribute significantly to maternal mortality.⁵ Multiple exceptional and exclusive changes in cardiac structure and function have been described in pre-eclampsia, suggesting that these women display abnormal cardiac adaptation to pregnancy and hence towards long-term postpartum cardiovascular disease (CVD). The development of pre-eclampsia and eclampsia is now considered a risk factor for long-term CVD.⁵

The data on changes in diastolic function in pregnancy induced hypertension is limited and studies have reported varying levels of diastolic function across various stages of gestation.¹⁰

Therefore, this study was undertaken to assess changes in diastolic function in pregnancy induced hypertension and compared to normal pregnant women by 2D echocardiography and Doppler evaluation.

This was a one year prospective study, conducted in the Department of Cardiology with 200 pregnant women that is, 100 women with pregnancy induced hypertension (Group H) and 100 women with normal pregnancy (Group N). All the women underwent 2D echo for the evaluation of diastolic function.

In this study majority of subjects were between 21 to 25 year of age i.e. 66% in Group H and 62% in Group N. Also the mean age in group H was 23.48 ± 2.38 years and in group N it was 23.06 ± 2.92 years ($p=0.032$) suggesting that the age distribution of the study population in group H and group N was comparable.

In this study, 92% women in Group H and 78% in Group N had gestational age of 36 weeks. The mean gestational age in group H was 35.78 ± 0.51 years and in group N it was 35.80 ± 0.57 years ($p=0.044$). Hence the gestational age in group H and group N was comparable. These findings rule out the possible bias in study results.

In the present study 2D echocardiography revealed majority of the women in group N with normal diastolic function that is grade 0 in 94% while in group H 56% of the women have normal diastolic function. This difference was statistically highly significant ($p<0.001$).

Furthermore, Grade 1 diastolic dysfunction was present in significantly higher number of women with pre-eclampsia compared to women with normal pregnancy (40% vs 6%) and Grade II diastolic dysfunction was noted in 4% of the women with pre-eclampsia while none of the normal women was found to have Grade II diastolic dysfunction.

Hence these findings suggest that, pregnant women with pre-eclampsia are likely to have diastolic dysfunction as assessed by 2D Echocardiography.

In this study Doppler parameters including MV: E/E' ($p = 0.004$), IVRT ($p < 0.001$), DS ($p < 0.001$), PVs ($p = 0.015$) and PVa ($p < 0.001$) were significantly high in group H compared to group N.

However MV: E, MV: A, MV: E/A, MV: E', MV: A', DTI, PVd and PVs/PVd were found to be comparable but statistically insignificant ($p > 0.05$).

Hence these findings suggest that, pregnant women with hypertension are likely to have diastolic dysfunction in terms of raised MV: E/E', IVRT, DS, PVs and PVA.

These findings were comparable to other studies.

In a study by Solanki R. et al¹⁰ authors evaluated maternal cardiovascular function using echocardiography in normal and pre-eclamptic women in the third trimester of pregnancy on 20 subjects with pre-eclampsia and 20 normotensive controls with 34 weeks gestation and singleton pregnancy. Study revealed that increased afterload in pregnancy induced hypertension is linked with reduced emptying of left ventricle. Increased E wave velocity in hypertensive patients suggest elevated trans mitral gradient during early diastole reflecting reduced LV compliance. The higher peak A wave velocity suggests more important role of atrial systole in filling of the hypertrophied ventricle in these women. The prolonged IVRT in pre-eclamptic subjects suggests that longer time is required for left ventricular pressure to fall below atrial pressure. The prolongation of E wave deceleration time in pre-eclamptic subjects is consistent with increased passive filling of left ventricle during early diastole. Mean cardiac output (66.85 ± 4.56 ml/min vs. 56.1 ± 1.77 ml/min), mean LV diastolic mass (66.85 ± 4.56 ml/min vs. 56.1 ± 1.77 ml/min) and total vascular resistance (1396.85 ± 150.2 vs. 1204.5 ± 71.182 dyne, s cm⁵) was higher in the women with pre eclampsia indicating reduced LV compliance and diastolic dysfunction. This study hence concluded that there are significant structural and dynamic changes in women with pre-eclampsia particularly reduced LV compliance and diastolic dysfunction. Blood pressure monitoring alone is insufficient in identifying and managing the risk of cardiovascular complications in such patients. Including echocardiographic assessment in the management protocol could help identify women who are at higher risk of developing complications.

Melchiorre K, et al.⁸ conducted a prospective case control study comparing the diastolic function of 50 patients with pre-eclampsia and 50 normal pregnancies. It was undertaken to evaluate cardiac function and LV remodeling occurring at term in patients with pre eclampsia. Global diastolic dysfunction was seen in 40% of pre eclampsia cases as compared to 14% in normotensive pregnancies ($p=0.007$). Altered indices of LV mass indicate Left ventricular adaptation to maintain myocardial contractility against increased afterload in pre-eclampsia patients. As diastolic dysfunction precedes systolic dysfunction in other causes, its development is of prognostic value in patients with pre-eclampsia. Hence this reiterates the importance of early detection of diastolic dysfunction in women with pre- eclampsia.

Conclusion:-

Echocardiography can be used as a useful screening tool to identify diastolic dysfunction in patients with pregnancy induced hypertension. The echocardiographic characteristics including Mitral Valve: E/E', IVRT, DS, PVs and PVA were significantly higher in pregnancy induced hypertension when compared to normotensive pregnant females.

Key words:-

Air pollution tolerance index, biochemical parameters, relative water content, ascorbic acid and bio monitoring

Abstract

The study examined Air pollution tolerance index (APTI) of 35 plants growing near metal casting foundries located in and around Peelamedu, Coimbatore. Four physiological and biochemical parameters of plant leaves namely total chlorophyll content, relative water content, pH, and ascorbic acid content which can be used as predictor of air quality. It is observed that *Lantana indica*, *Nerium indicum*, *Duranta repens*, *Amaranthus viridis*, *Ricinus communis*, *Bauhinia racemosa* and *Samanea saman*, showed higher APTI values. The study indicates that plantation of tolerant species are useful for bio monitoring and to develop green belt in and around industrial areas.

Introduction:-

Air pollution was earlier considered as a local problem around large point sources. But due to the use of tall stacks and long range transport of pollutants, it has become a regional problem. Many developing countries including India have experience a progressive degradation in air quality as a result of rapid pace of development over the last three decades. During this period newly industrialized countries underwent unparalleled economic growth, swelling urban populations and generated excessive emissions from automobiles, factories and refuse burning (Agbaire and Esiefarienrhe 2009). Much of the 20th century witnessed an increasing trend in urbanization in developing countries. While urbanization is a stimulus of development, in the process many cities in Asia, Africa, the Near East and Latin America are facing two challenges of pollution and congestion (Ashmore, 2005).

Air pollution is more complex than most other environmental challenges. No physical or chemical methods are known to ameliorate air pollution. A suitable alternative is to develop a biological by growing green plants in and around industrial and urban areas (Shannigrahi *et al.*, 2004, Ghose and Majee 2001 and Aarti *et al.*, 2012).

Plants plays a vital role in monitoring and maintaining the ecological balance by actively participating in the cycling of nutrient and gases like CO₂, O₂ and also provide enormous leaf area for impingement absorption and accumulation of air pollutants to reduce the pollution level in the air environment (Escobedo *et al.*, 2008). Several contributors agree that air pollution affects the plant growth adversely (Rao 2006, Chandawatet *et al.*, 2011 and Bhattacharya *et al.*, 2012).

Coimbatore, one of India's leading industrial centers with excellent potential for industrial growth is spread about 105.6 sq.km and has a population of 1.1 million people. The city is one of the important foundry cluster area in

southern India. The majority of the foundry units fall under the category of small scale industry. There are about 250 small scale foundries located every 2 km in the industrial sector of Coimbatore. Air pollution due to these industries has become a serious environmental stress to plants. The emission of gases and dust particles from the industry causes serious setback to the overall physiology of plants. Among all the plant parts, leaf is the most sensitive part to air pollutants and several other such external factors. Response of plants toward air is being assessed by air pollution tolerance index. This index has been used to rank plant species in their order of tolerance to air pollution. Some plant species and varieties are so sensitive that they can be conveniently employed as biological indicator or monitors of specific pollutants. The present investigation was undertaken to study the air pollution tolerance index of plant growing near metal casting foundries located in and around Peelamedu, Coimbatore.

Materials and Methods:-

Study Area:-

Peelamedu is a residential and commercial neighborhood in the city of Coimbatore, Tamil Nadu, India, located at 11.031.N and 76.999 E. It is situated just 5 km away from the heart of the city Gandhipuram. There are many large, medium and small scale metal casting foundries are operating from here.

Sampling:-

For the present study, fresh leaves from each plant were collected from the experimental sites of urban and industrial areas of Peelamedu from July to March, 2012-2013. Three replicates of fully matured leaves of each species were taken in the morning (9:30 am to 11:30 am). The experiments were replicated three times for each biological factor. Leaves from same plant species (control) were collected from Indian Forest Genetics and Tree Breeding (IFGTB) Campus which is used as control area located far away from the industrial area which is a pollution free atmosphere. The weight of fresh leaves was taken immediately upon getting to the laboratory. Samples were preserved in refrigerator for further analysis.

Ascorbic acid content:-

Ascorbic acid content (expressed in mg/g) was measured using spectrophotometric method (Bajaj and Kaur, 1981). 1 gram of the sample was measured in to a test tube, 4 ml oxalic acid – EDTA extracting solution was added. Then 1 ml of orthophosphoric acid followed by 1 ml of 5% tetraxosulphate (vi) acid. To this 2ml ammonium molybdate was added and then 3ml of water. The solution was then allowed to stand for 15 minute, after which the absorbance at 760 nm was measured with a spectrophotometer. The concentrations of ascorbic acid in the sample were then extrapolated from a standard ascorbic acid curve.

Total chlorophyll content:-

Chlorophyll content was estimated using the method of Arnon (1949). 0.1 gram of fresh leaf material crushed with mortar and pestle. The crushed samples were collected and washed with 2 ml of 80 per cent acetone in three tubes. The contents are transformed into centrifuge tubes and the samples are centrifuged at 2,500 rpm for 10 min. The supernatant was collected in each test tube and the final volume of supernatant is made up to 10 ml by adding 80 per cent acetone using measuring cylinder and the absorbance is read at 645 nm and 663 nm for chlorophyll a and b using a spectrophotometer. The amount of total chlorophyll present in the extract (mg chlorophyll per gram tissue) was calculated by using the formula given below:

$$\text{Chlorophyll a / g tissue} = 12.7 (A_{663}) - 2.69 (A_{645}) \times \frac{V}{1000} \times W$$

$$\text{Chlorophyll b / g tissue} = 22.9 (A_{645}) - 4.68 (A_{663}) \times \frac{V}{1000} \times W$$

$$\text{Total chlorophyll / g tissue} = 20.2 (A_{645}) - 78.02 (A_{663}) \times \frac{V}{1000} \times W$$

where: A = Absorbance at specific wave length, V = Final volume of chlorophyll extract in 80 per cent acetone, W = Fresh weight of tissue extracted.

Leaf extract pH:-

For determining pH of leaf extract, 5 gram of fresh leaf material was homogenized with 50 ml of distilled water and samples of the homogenate were centrifuged at 3000 rpm for 10 min and pH value of leaf extract was determined using a calibrated digital pH meter with buffer solution of pH 4 and pH 7.

Relative water content:-

Leaf RWC is determined by using the method described by Singh (1997) and calculated with the formula $RWC (\%) = [(FW - DW) / (TW - DW)] \times 100$

where, **FW** – Fresh Weight,

DW – Dry Weight,

TW – Turgid Weight.

Fresh weight is recorded by weighting the fresh leaves. To get the dry weight, the leaves were dried in an oven at 70°C for overnight and then taken the dry weight. For getting the turgid weight, the leaves were immersed in water overnight, blotted dry and then weighed.

Air pollution tolerance index determination:-

APTI was calculated by the following formula proposed by Singh and Rao (1983). The formula of APTI is given as:

$$APTI = [A (T+P) + R] / 10$$

Where A= ascorbic acid content (mg/g)

T= total chlorophyll (mg/g)

P= pH of leaf extract

R= relative water content of leaf (%)

Results and Discussion:-

The plant being constantly exposed to the environment absorbs, accumulate and integrate pollutants impinging on their foliar surface. Consequently they show visible or subtle changes depending on their sensitivity level.

The increased level of ascorbic acid in leaves will increase air pollution tolerance in plants (Chaudhury and Rao, 1977). In the present study, the plant species namely *Duranta repens*, *Lantana indica*, *Nerium indicum*, *Bauhinia racemosa*, *Terminalia catappa*, and *Prosopis juliflora* showed increased concentration of ascorbic acid (Table 1). The variation in chlorophyll content in plants is because of various environmental factors such as air, water and soil (Katiyar and Dubey 2000). Chlorophyll is the principal photoreceptor in photosynthesis. Hence its measurement is an important tool to evaluate the effects of air pollutants on plants. It plays an important role in plant metabolism and any reduction in chlorophyll content corresponds directly to plant growth (Joshi and Swami, 2009). A higher concentration of chlorophyll was recorded in *Amaranthus viridis* followed by *Ricinus communis*, *Aegle marmelos*, *Cassia fistula*, *Lowsonia inermis* and *Nerium indicum* (Table 1).

The leaf extract pH was found to be alkaline in species like *Lantana indica* (7.8), *Citrus lemon* (7.3) and *Achyranthus aspera* (7.2) whereas, it was acidic in other species. A significantly lowest pH value was shown in *Terminalia catappa* (4.5) (Table 1). Schlitz and Reck (1977) reported that in the presence of an acidic pollutant, the leaf pH is lowered and decline is greater in sensitive species. A shift in cell sap pH toward the acid side in the presence of an acidic pollutant might decrease the efficiency of conversion of hexose sugar to ascorbic acid. However, the reducing activity of ascorbic acid is pH controlled, being more at higher and less at lower pH. Hence, the leaf extract pH on the higher side gives tolerance to plants against pollution (Agarwal and Tiwari, 1997). Relative water content is associated with protoplasmic permeability in cells caused loss of water and dissolved nutrient resulting in early senescence of leaves (Masuch *et al.* 1988). It is likely that the plants species with high relative water content may be tolerant to pollutants. The relative water content was found to be higher in *Nerium indicum* (86.03), and *Polyalthia longifolia* (84.23), *Pisonia alba* (83.7), *Achyranthus aspera* (82.0), *Lowsonia inermis* (81.0) and *Prosopis juliflora* (80.0) (Table 1).

Air pollution tolerance index is an index denotes the capability of a plant to combat against air pollution. Plant which have higher index value are tolerant to air pollution and can be caused as sink to mitigate pollution, while plants with low index value show less tolerance and can be used to indicate levels of air pollution (Singh and Rao, 1983). Among the plant species studied the highest tolerance was shown *Lantana indica* (68.12), *Nerium indicum* (67.10), *Duranta repens* (59.79), *Ricinus communis* (56.70), *Amaranthus viridis* (57.60), *Bauhinia racemosa* (54.50), *Samanea saman* (52.06), *Prosopis juliflora* (51.60) and *Thespesia populnea* (50.86) (Figur.1). Plantation of these tolerant species is useful for bio monitoring and to develop the green belt among the nature and to reduce industrial air pollution. This is very essential for saving the environment for our future generation to protect the present generation.

Conclusion:-

Day by day with increasing urbanization and industrialization, the air quality is degrading. Plants play a significant role in mitigating air pollution and maintaining ecological balance. APTI determination is of utmost importance because with an increase in small scale industries the pollution load is on the rise. From the results of the present study, this tolerant plant species can be used as indicators of pollution thereby acting as a sink to all air pollutants.

Left bundle branch block(LBBB), Left ventricular dysfunction(LV dysfunction),mechanical dyssynchrony, Speckle tracking, Real time 3D Echocardiography(RT3DE).

Abstract

Background: LBBB affects LV function and causes LV mechanical dyssynchrony. Prevalence of LBBB increases with age about 0.05% to 5.7% between age of 30-80 years in otherwise healthy population. Aim of the study was to evaluate the LV function and mechanical dyssynchrony with 2D Echocardiography, 2D speckle tracking and real time 3D Echocardiography (RT3DE) in asymptomatic LBBB patients, non- LBBB volunteers, and with symptomatic LBBB patients.

Methods: 2D Echocardiography, 2D speckle tracking and real time 3D Echocardiography was performed in 191 patients, 65 were non- LBBB volunteers, 60 patients were asymptomatic LBBB and 66 patients were symptomatic LBBB patients. Global LV function and mechanical dyssynchrony were measured.

Results: Non LBBB volunteers mean LV ejection fraction by 2D Echo was $67.18 \pm \text{SD } 3.45$, in RT3DE mean LV ejection fraction was $61.88 \pm \text{SD } 3.12$. In asymptomatic LBBB patients LVEF by 2D was $58.43 \pm$ and RT3DE LVEF was 54.47 ± 4.08 . In heart failure (HF) with LBBB patients 2D LVEF was 43.53 ± 7.12 and 3D LVEF 39.21 ± 7.97 .

LV dyssynchrony measurements by 2D speckle tracking analysis showed:

- A. Sdt of 6S segments by CS was 54.82 ± 11.2 , 96.43 ± 17.73 , 119.02 ± 23.17 for non-LBBB volunteers, asymptomatic LBBB patients and symptomatic LBBB patients respectively.
- B. Sdt of 12S by LS was 52.96 ± 5.1 , 90.03 ± 16.2 , 111.75 ± 34.22 for non-LBBB volunteers, asymptomatic LBBB patients and symptomatic LBBB patients respectively.

Systolic dyssynchrony (SDI) index by RT3DE was 5.07 ± 2.22 , 7.44 ± 1.45 , 15.08 ± 3.85 for non-LBBB volunteers, asymptomatic LBBB patients and symptomatic LBBB patients respectively.

Conclusion: Asymptomatic LBBB patients have more depressed LV function than non LBBB volunteers with intermediate mechanical dyssynchrony, symptomatic LBBB patients have moderate to severe LV dysfunction and most severe mechanical dyssynchrony among the 3 groups.

Introduction:-

Left ventricular (LV) mechanical dyssynchrony is observed in left bundle branch block (LBBB). Persistent mechanical dyssynchrony contributes to progressive ventricular remodelling and impaired systolic LV function.¹ Mechanical dyssynchrony may partially be responsible for the increased morbidity and mortality in heart failure (HF) patients with conduction abnormalities as a LBBB, compared to patients without a LBBB.²⁻⁵

In patients without underlying structural cardiac disease, except the presence of a LBBB, subtle impaired systolic and diastolic LV functions are frequently found.⁶ However, impaired function in these patients is not always recognized because of lack of clinical symptoms.⁶⁻⁸

Prevalence of LBBB increases with age about 0.05% to 5.7% between age of 30-80 years in otherwise healthy population.²⁴⁻²⁶ Currently, the most widely used methods for the clinical assessment of LV function and mechanical dyssynchrony are two-dimensional (2D) echocardiography and tissue Doppler imaging.⁹⁻¹¹

Speckle tracking strain analysis method based on grayscale 2-dimensional (2D) images, and transthoracic real-time three-dimensional echocardiography (RT3DE) are relatively novel imaging technique which offers the unique opportunity to evaluate global LV function fast and accurate, without presumptions and with comparable results as 2D Echocardiography and magnetic resonance imaging.¹²⁻¹⁵ In addition, combined with specially designed software, provides detailed quantitative information of mechanical dyssynchrony.¹⁶⁻¹⁸

Therefore, we designed a prospective cross-sectional study to assess global LV function and mechanical dyssynchrony in consecutive LBBB patients. The first purpose of this study was to evaluate global LV function and the amount of mechanical dyssynchrony by Speckle tracking strain analysis and RT3DE in asymptomatic LBBB patients compared to non- LBBB volunteers and patients with symptomatic LBBB. The second purpose was to evaluate the association between LV mechanical dyssynchrony and the presence or absence of symptoms of HF.

Methods:-

LBBB was diagnosed according to standard electrocardiography criteria: A QRS duration greater than 120 ms, absence of initial septal Q waves, a broadened R wave in the left precordial leads, and an initial R wave followed by a wide, deep S wave in the right precordial leads on a 12-lead electrocardiogram. Symptoms of HF included dyspnoea, ankle oedema, fatigue and reduced exercise tolerance.

Consecutive OPD and IPD patients of LBBB attending to our department of Cardiology were included as per inclusion criteria. Ethical committee clearance was taken.

There are very few studies quantifying LV volume, ejection fraction and mechanical dyssynchrony in patients with LBBB by 2D Echocardiography, 2D speckle tracking, real time 3D echo, hence we have taken up this study. One hundred and ninety one subjects were studied, consisting of sixty five volunteers with no abnormal findings during physical examination, no conduction abnormalities on electrocardiogram; sixty consecutive asymptomatic LBBB patients, with no history of structural cardiac disease and no abnormal findings during physical examination, New York Heart Association function class (NYHA) I and sixty-six consecutive symptomatic LBBB patients, NYHA II–III, without pulmonary hypertension, were screened.

ECG gated echocardiography was performed using EPI Q 7C (Philips Medical Systems, Andover, Mass), installed with highly advanced software techniques are used for 2D echocardiography, 2D speckle tracking with strain imaging, real time 3D Echocardiography image acquisitions. A matrix array transducer with a frequency range from 2 to 5 mhz, and the transducer was maintained in a fixed orientation. A complete examination of patients with normal conduction and those with LBBB was performed

Quantification of LV function:-

Dimensional echocardiographic LV volume and LVEF by modified Simpson's method:-

Transthoracic apical 4-chamber view was performed, later Left ventricular end diastolic image and Left ventricular end systolic images were acquired, and in the same way apical 2-Chamber Left ventricular end diastolic image and Left ventricular end systolic ECG gated images were acquired with patient in left lateral decubitus position. Then LV end diastolic volume, LV end systolic volumes, LVEF was estimated in apical 4- and apical 2-chamber windows by the modified Simpson's method.

The volume of the LV is calculated from the dimension and area obtained from orthogonal apical views (four-chamber and two-chamber views). The LV volume was then calculated with the modified Simpson method or disk summation method

Three -Dimensional data acquisition and Analysis:-

Three-dimensional echocardiography, first as reconstructed images and more recently as real-time acquisition, provides reproducible assessment of LV volumes, dimensions and systolic function. Using dedicated reconstruction software, semi-automated border detection allows continuous volume calculation of all 16 myocardial segments simultaneously. Represented as regional volumetric curves during the cardiac cycle, the timing of minimal volume for each segment can be analyzed. With normal homogeneous activation, the different LV segments reach their minimal volume at the same time.

Transthoracic apical 4-chamber full volume acquisitions were made during 4 –6 s breath-hold, with the patient in left lateral position. Care was taken to include the entire LV volume within the pyramid shaped 3D scan-volume. Due to the sector width of the acquired volume, three alternate heart cycles and a constant R-R interval were obligatory or compulsory to create a full-volume acquisition of the LV.

Then apically acquired dataset was imported into an offline software package for analysis.

- Identification of three points or land marks i, e mitral valve, aortic valve and apex was done, then the volume data set was automatically sliced into eight equally rotated imaging planes, in this end systolic frame and end diastolic frames were identified.
- After identification of end systolic frame and end diastolic frames, the apex and two annulus points were determined in both end diastolic and end systolic state.
- Later endocardial borders were traced in end-diastole using an automated counter detection software system, in case the borders were not accurate, manually these endocardial borders were manipulated and adjusted, then a full volume 3-D model of the left ventricle was reconstructed.i.e a LV cast is formed.
- After a full volume 3D model of the left ventricle was reconstructed, the left ventricle was divided into 16-segments, then segmental analysis was performed, later end diastolic end systolic volumes and ejection fraction were displayed on screen along with this global and segmental volume and EF were presented.

Quantification of left ventricular mechanical dyssynchrony:-

Real time 3D Echo:-

LV cast was divided into 16 pyramid-shaped segments. For each segment, a regional time-volume curve was obtained and the systolic dyssynchrony index (SDI) was derived. From the regional time-volume curves, the systolic dyssynchrony index (SDI) was derived.²⁰ SDI is based on the standard deviation of mean time-to-minimal regional volume of 16 LV segments (six basal, six mid-segments and four apical segments) during a cardiac cycle. In other words, SDI is the dispersion of time-to-minimal regional volume for all 16 LV segments. Time is represented as percentage of the RR interval to allow comparisons of different patients which otherwise could be influenced by RR interval duration.

Speckle tracking strain Analysis:-

Standard grayscale 2D images were acquired in the 2- and 4-chamber apical views as well as the parasternal and short-axis views. From an end-systolic single frame, a region of interest was traced on the endocardial cavity interface by a point-and-click approach. Then an automated tracking algorithm followed the endocardium from this single frame throughout the cardiac cycle. Further adjustment of the region of interest was performed to ensure that all of the myocardial regions were included. Speckles, equally distributed in the region of interest, could be followed throughout the entire cardiac cycle. The distance between the speckles was measured as a function of time, and parameters of myocardial deformation could be calculated.

Myocardium was divided into 6 segments that were color coded and displayed into 6 segmental time-strain curves for CS, and LS.²⁷

Two different parameters for dyssynchrony were obtained:-

Circumferential Strain (CS)

- Difference between time to peak-systolic strain of the (antero) septal and posterior segments (AS-P delay).
Figure B
- The standard deviation of time to peak-systolic strain for all 6 segments (sdt6s) was measured.

Figure B:- Difference between time to peak-systolic strain of the (antero) septal and posterior segments (AS-P delay) by circumferential strain.

Longitudinal Strain (Ls):-

- Difference between time to peak-systolic strain of the basal-septal and basal-lateral LV segment (BS-BL delay).
Figure C
- The standard deviation of time to peak-systolic strain for 12 LV segments (sdt12s)

Figure C:- Difference between time to peak-systolic strain of the basal-septal and basal-lateral LV segment (BS-BL delay) by longitudinal strain.

Statistical Analysis:-

Data are expressed as mean value \pm standard deviation(SD). For comparison of means between the three groups, a one way ANOVA test with Tukeys multiple posthoc analysis was used. A probability value of $p < 0.05$ was considered as statistically significant.

Results:-

Subjects:-

A total of 191 consecutive LBBB patients and non- LBBB volunteers were enrolled. The final study population consisted of Sixty five non LBBB volunteers (mean age 51 ± 7 years, QRS duration 96 ± 4 ms), sixty patients with an asymptomatic LBBB (mean age 60 ± 7 years, QRS duration 139 ± 2 ms) and sixty-six patients with symptomatic LBBB (mean age 61 ± 9 years, QRS duration 151 ± 10 ms).

QRS duration of both asymptomatic LBBB and symptomatic LBBB groups was significantly more compared to non- LBBB volunteers ($p = 0.0001$)

Then further comparing QRS duration of symptomatic LBBB patients and asymptomatic LBBB it was observed that symptomatic LBBB patients had more QRS duration. ($p = 0.0001$). *Table 1*

Discussion:-

Important finding of this study is that, 2D Echocardiography, 2D speckle tracking, RT 3D Echo are useful for detecting differences in global LV function and mechanical LV dyssynchrony in LBBB patients with or without symptoms compared to non- LBBB volunteers.

Assessment of global LV function demonstrated that patients with asymptomatic LBBB and patients with symptomatic LBBB had a mild and moderate to severe reduction in EF respectively.

The EF, EDV, ESV measured with RT 3D Echo was lesser than one would expect when conventional 2D Echocardiography is used.

Mechanical dyssynchrony assessed by RT 3D Echo and *speckle* tracking strain analysis showed that non-LBBB volunteers had mild mechanical dyssynchrony. In asymptomatic LBBB patients intermediate mechanical dyssynchrony was observed and in symptomatic LBBB patients severe mechanical dyssynchrony was noted, which differed significantly among these 3 groups.

As observed previously in other studies, the EF and the amount of mechanical dyssynchrony showed an inverse correlation.²⁰ In accordance with results of a study by Vernooij et al.,¹ the trend to increased mechanical dyssynchrony in asymptomatic LBBB patients and the significant increased mechanical dyssynchrony in symptomatic LBBB patients in the present study, might be held responsible for the observed mild global LV dysfunction in asymptomatic LBBB patients and moderate to severe global LV dysfunction in symptomatic LBBB patients. Thus, demonstrating that mechanical dyssynchrony might negatively affect LV function and the resulting symptomatic status.

A study conducted by Kapetanakis et al.²⁰ showed HF with symptomatic LBBB patients with severe LV dysfunction had SDI of 15.7 ± 6.7 which was in accordance with SDI of 15.08 ± 3.85 in our symptomatic LBBB patients.

Another study conducted by Jeroen van dijk et al.²⁸ found SDI of 12.8 ± 4.8 in HF patients with LBBB which was in accordance with SDI of 15.08 ± 3.85 in our study.

In our study, number of LBBB patients enrolled is larger when compared to other older studies. It is also one of the first of its kind where LBBB patients are evaluated to assess global LV function and mechanical dyssynchrony in comparison to non- LBBB volunteers by means of 2D Echocardiography, 2D Speckle tracking strain analysis and 3D Echocardiography.

Clinical implications:-

With evaluation of LBBB patients with and without symptoms, differences in global LV function and mechanical dyssynchrony was observed which suggested that patients with a LBBB, who achieve a certain amount of mechanical dyssynchrony, may develop symptomatic HF. Therapeutic interventions that will decrease mechanical dyssynchrony may lead to a reduction of symptoms and improvement in LV function.

Study limitations:-

In patients with a LBBB, it is often unknown for how long a LBBB has been present. The process of remodelling of the LV that might occur after the formation of a LBBB, may be more distinct in a patient with a long lasting LBBB, than in a patient with a new onset LBBB.

In RT3DE, frame rates are relatively low (20 –25 Hz) compared to tissue Doppler imaging (100 –150 Hz). For evaluation of mechanical dyssynchrony, low frame rates can be a limitation in detecting very subtle dyssynchrony differences between the segments. However, RT3DE acquisitions have high spatial resolution and post-processing analysis can be done fast with good reproducibility, compared to other imaging techniques.²¹⁻²³

Conclusion:-

2D Echocardiography, 2D Speckle tracking strain analysis and 3D Echocardiographic evaluation of LBBB patients with or without symptoms and non-LBBB volunteers showed that global LV function of asymptomatic LBBB patients already slightly impaired compared to non-LBBB volunteers. However it was observed that patients with symptomatic LBBB have most severely impaired LV function.

Based on global LV function analysis in all 3 groups by 2D Echocardiography and real time 3D Echocardiography found that the values observed by real time 3D Echocardiography were significantly lesser when compared to 2D Echocardiography as 2D Echo considers LV in the form of a cylinder. Whereas, real time 3D Echocardiography during measurements take endocardial contours which are semi-automatically detected during the complete cardiac cycle creating a LV cast which is used to measure the LV volumes and EF. Hence real time 3D Echocardiography is more accurate and standardised method when compared to 2D Echocardiography.

Mechanical LV dyssynchrony in asymptomatic LBBB patients is already increased and patients with symptomatic LBBB have the more severe mechanical dyssynchrony.

Quantification of mechanical dyssynchrony with 2D speckle tracking strain imaging and RT3DE is useful, as increased mechanical dyssynchrony might have an effect on global LV dysfunction and consequential symptoms. EF and the amount of mechanical dyssynchrony showed an inverse correlation in our study indicating that when a substantial level of LV mechanical dyssynchrony is reached, it might be suggestive for the presence of symptoms.

Abstract

The present work brings to light the effect of divalent (viz. Mg) doping on the Young's Modulus (YM) of ZnO nanowires (NWs), as a function of diameters considering surface stress effect. It is seen that the YM exhibits contrasting behavior for different doping concentrations of Mg. The variation in the YM is seen to be of semiconductive type, which then is seen to change to depict conductive type behavior on the immersion of Mg as a dopant. The doping along with surface stress play as deciding factors in determining the mechanical properties; especially the YM of the ZnO nanowires.

Introduction:-

Thin Films and Nanowires are emerging as one of the most enticing fragments offered by the recent developments in the field of Nanotechnology in current times. Also, along with the Thin Films and NWs developed from pure undoped materials, a new horizon has been put forth by the concept of doping and the variation that this doping can bring in the material. More recent studies show that this idea of doping has proved to be an extremely valuable aspect as it can be used to unlock the hidden potentials and frontiers that the material has to offer. So, decent understanding of the outcomes of doping on semiconductor materials is essential. ZnO is one of the most commonly used semiconductor materials with a direct bandgap of ~3.37 eV at room temperature which leads to its abundant applications in the field of Photonics and Optoelectronics [1-4]. Previous Studies [5-7] of size dependence of YM of ZnO NWs has further lead us to explore out their mechanical properties for the practical applications. Along with diameter, the concentration of doping usually exerts a great influence on its overall mechanical properties; especially the YM which is believed to be determined by the contribution of both bulk elastic modulus and surface elastic modulus. So, it is of great interest to explore how the YM of the ZnO NWs varies as a function of their diameters and concentrations of doping.

Theoretical Approach:-

In order to estimate the YM of the ZnO nanowires the effects due to surface stress as discussed in the ref. [5,6] and can be written as,

$$E_{\text{nanowire}} = \frac{8}{5} g(1 - \nu) \frac{L^2}{D^3} (1)$$

Where D is the diameter of the nanowire, L is the length of the nanowire, ν is the Poisson's ratio and g is the surface stress [5,6,10]. As, the diameter of the nanowires increases, the equilibrium strain approaches to zero [5,7]. Further,

it is the surface stress that plays as an important parameter and changes with the change in the concentration of doping [5,6,9].

Results and Discussion:-

In this work, we bring forth our results on the investigation of the YM of Mg doped ZnO nanowires. Here, the length of the nanowire is assumed to be 1000 nm [5,6], the typical length suspended when the nanowire is suspended using three point's clamped bending condition. The concentrations of Mg doping in ZnO is taken to be 0%, 2%, 4%, 6%, 8% and 10%. We have seen that the ZnO shows different behavior for undoped (i.e. 0%) and the doped case (i.e. 0%, 2%, 4%, 6%, 8% and 10%. respectively) [9]. We have taken into consideration (100) and (101) directions of growth of the NWs at growth temperature and annealed at 500°C and 700°C with the data acquired from other studies regarding the same [9]. From Fig 1, we can see that the YM increases for the as grown state of the Mg doped ZnO NWs but we see that when we anneal the same at temperatures above 450°C, the YM decreases with decreasing diameters showing semiconductive behavior [5-7]. Previous studies [10] suggest that the crystallization in ZnO occurs after crossing the 300°C temperature which is believed to be one of the reasons that the following trends and behavior are seen in the undoped ZnO case. Also, it is seen that the increase in temperature of annealing leads to further decrease in the YM of undoped ZnO NWs.

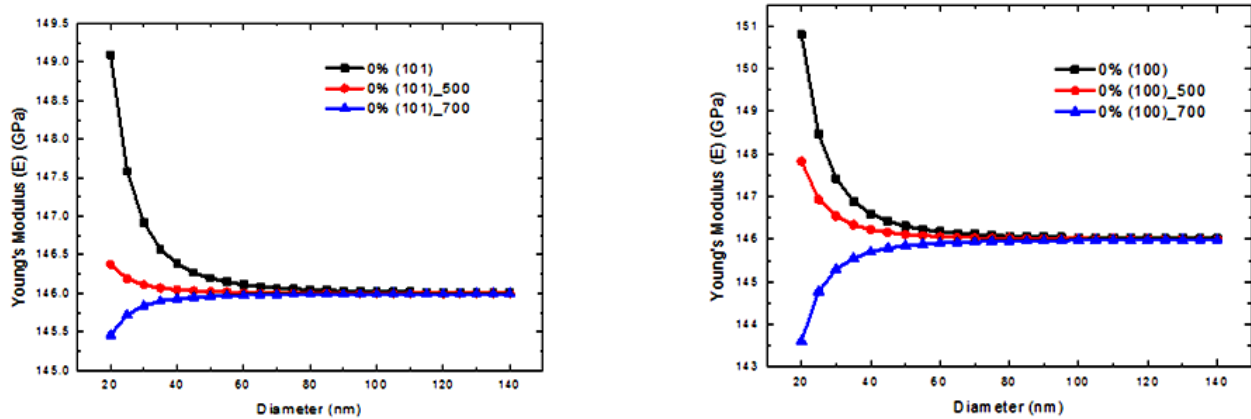

Figure 1:- YM vs. diameter for undoped ZnO NWs for (100) and (101) orientations at different temperatures.

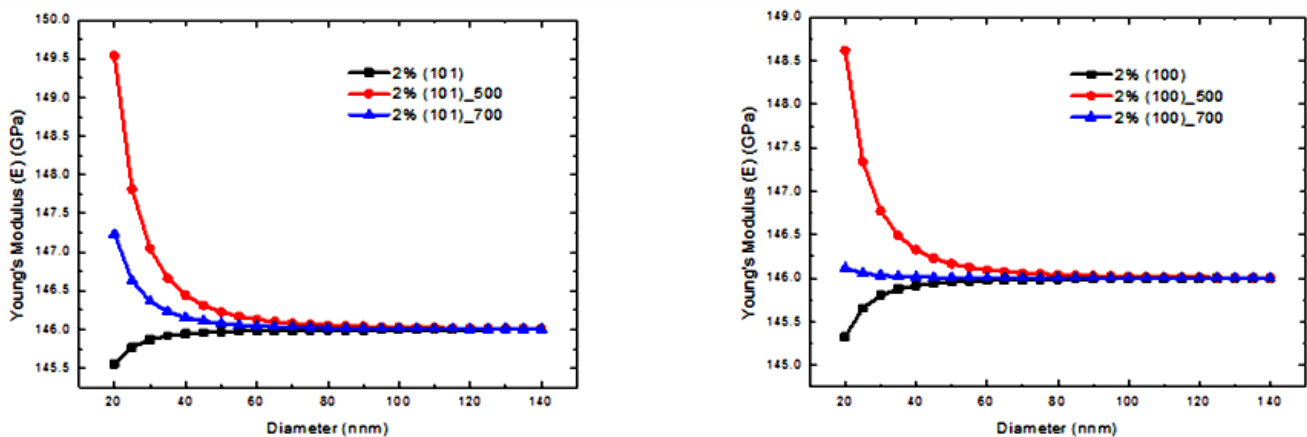

Figure 2:- YM vs. diameter for 2% Mg doped ZnO NWs for (100) and (101) orientations at different temperatures.

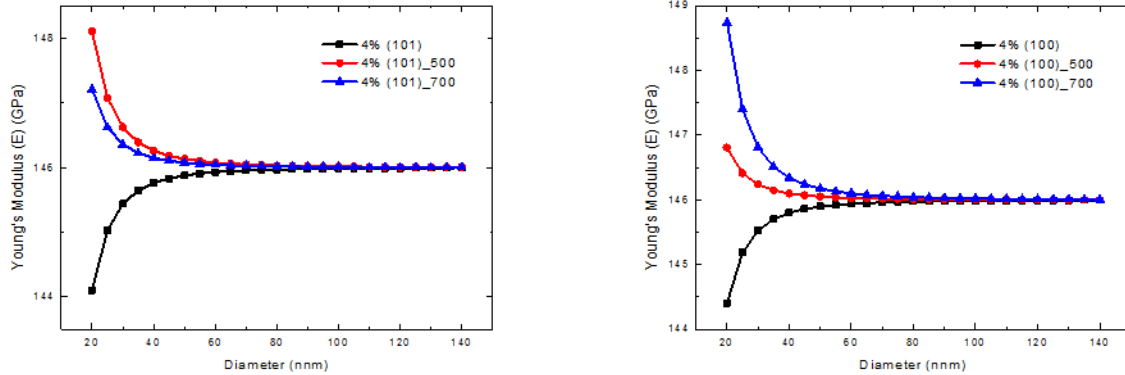

Figure 3:- YM vs. diameter for 4% Mg doped ZnO NWs for (100) and (101) orientations at different temperatures.

A similar approach was used to demonstrate the effect of Mg doping on the ZnO nanowires and it was observed that the results are quite exciting. It was seen that unlike the undoped case, the doping of Mg in various concentrations lead to an increase in the YM of the Mg doped ZnO NWs. The YM is found to increase with the decreasing diameters and hence show the conducting behavior [5] which is supported by the fact that the doping of Mg in ZnO leads to a change in bandgap of the material. Fig 2-6, show the effect of various doping concentrations on the YM of the ZnO NWs. An evident point is seen that as the doping concentrations increase the maximum value of YM of the NWs decreases. It may be because the effect of Mg doping on ZnO is substitutional. The peak value of YM in both orientations of growth is seen at 500°C for 2% doping and at 700°C for 4% doping of Mg showing the effect of doping on the crystallization temperature of the resultant material.

Figure 4:- YM vs. diameter for 6% Mg doped ZnO NWs for (100) and (101) orientations at different temperatures.

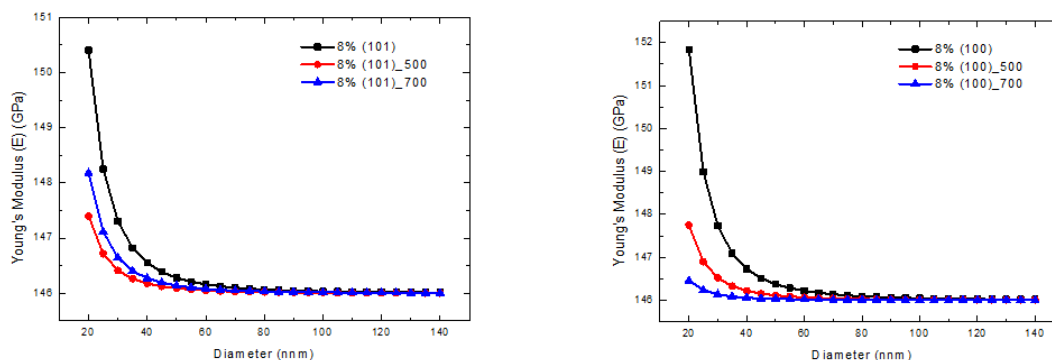

Figure 5:- YM vs. diameter for 8% Mg doped ZnO NWs for (100) and (101) orientations at different temperatures.

A major change in the behavior of the YM is seen from Fig. 4 and 5. It is seen that the trend of the YM for the as grown temperature is changed from the behavior exhibited in the previous two doping concentrations. The maximum value of YM for the 6% doping case was found to be at 600°C temperature which is in good agreement with the 4% result. But, to our surprise the maximum value of the YM unlike the above two cases was seen to be that of the sample at the growth temperature for both the orientations. This has opened a new window for us to explore as to how the above change has taken place.

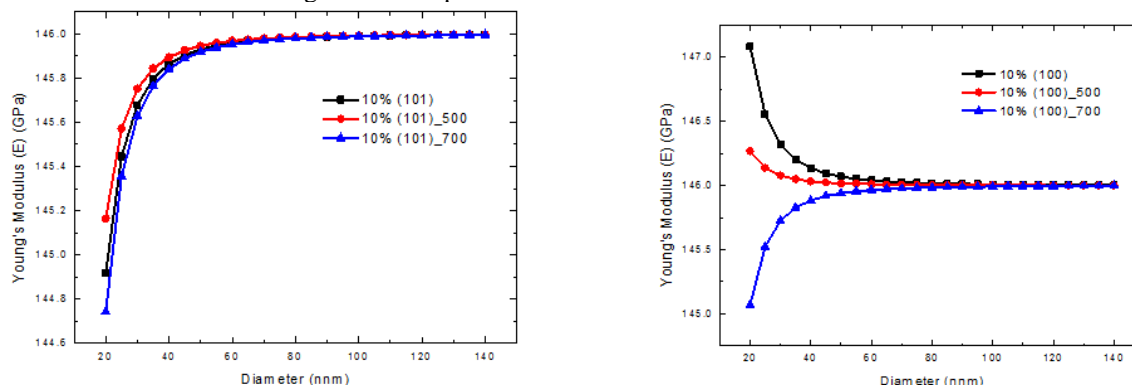

Figure 6:- YM vs. diameter for 10% Mg doped ZnO NWs for (100) and (101) orientations at different temperatures.

An even unexpected turn of behavior was seen in the 10% doping sample because it shows a decrease in the YM of the NWs with decreasing diameters in all the three temperatures at the (101) orientation, but at (100) orientation the behavior was seen to strike an unusual resemblance to that of the undoped case. This is yet to be seen as to what is the reason behind such a behavior seen in the NWs. All of the above discussed results have been computed from the values of the surface stress obtained from ref. 9 and we can see that the surface stress plays the deciding factor in the considered model for the estimation of behavior of Mg doped ZnO NWs. The variation in the surface stress with the corresponding change in the doping concentration of the material is shown in Fig7. This change in the surface stress is one of the pivotal reasons to the behavior observed in 8% and 10% doped samples.

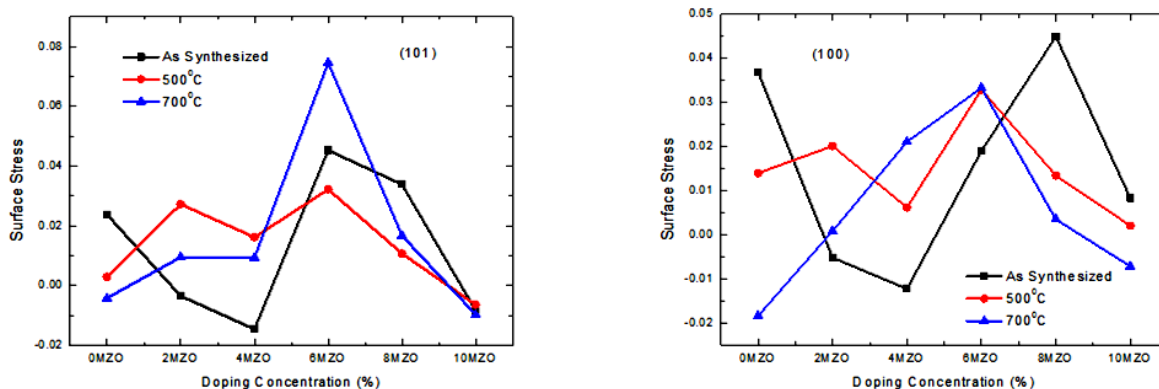

Figure 7:- Surface Stress vs. Doping Concentrations of Mg doped ZnO NWs for (100) and (101) orientations.

Conclusion:-

The results suggest that ZnO NWs can give different natures with the same diameter if the concentrations of doping are altered which would result in the respective change in the surface stress as well. We have mainly focused on the variation that occurs when we consider doping at different temperatures and orientations, and its effect on the YM of the NWs. It is clear that a surface with positive (tensile) surface stress will lead to an increase in the YM whereas the surface with negative (compressive) surface stress will lead to a decrease in the YM of the NWs[5-7]. Thus, as the surface stress plays an important role we can see that it might be the possible key factor in engineering the desired mechanical properties.

Abstract

Background: The use of plants gained widespread as well in developing countries as in developed countries for different purposes and both as mixture or single formula. That widespread use does not guarantee their safety and efficiency. The aim of the present study is to assess the phytochemistry and subacute toxicity of *Mitragynainermis*, an alleged nephroprotective properties plant acclimated in Benin.

Methods: By complexation and/ or precipitation reactions, the different groups of secondary metabolites in these plants were highlighted. The crude aqueous extract of *M. inermis* has been force-fed to rats for seven days. They were observed for toxicity signs and some blood biochemical parameters have been evaluated before and after treatment. We used Microsoft excel and Minitab 1.6 to process data.

Result: Different phytochemicals were found and crude aqueous extract of *M. inermis* doesn't induce toxicity signs on rats after seven-day force-feeding up to 2500 km/kg of body weight using oral route. Biochemical analysis shows a significant decrease in blood level of urea and creatinine up to 2500 km/kg of body weight. The significant increase in ALAT by D2 (1000 km/kg dose) and both in ALAT and ASAT by D3 (2500 km/kg dose) after 7 days is decreased and normalized during the observation period.

Conclusion: Crude aqueous extract of *M. inermis* stem bark is less toxic up to 2500 km/kg of body weight and should be taken during consecutively less than 7 days.

Introduction:-

The use of plant for nutritional and therapeutic purposes dates back to the 'old world' where trial and error methods were employed in the folklore means to treat ailments and diseases. Traditional medicine has proved to be a key element among the rural communities in developing countries for the provision of primary health care especially

Corresponding Author:- Maxime Machioud Sangare.

Address:-Department of Animal Physiology, Laboratory of Animal Physiology, University of Abomey-Calavi 06 BP 2584 Cotonou (Benin).

where there are inadequate primary health care systems (Tijani *et al.*, 2012). The existence of traditional medicine depends on plant species diversity and related knowledge of their use as herbal medicine (Ssegawa *et al.*, 2007). Nowadays, many plants have been studied and some of their attributed empirical properties in healing proved to be true. Most of these plants often display a wide range of biological and medicinal properties such as anti-inflammatory, antihemorrhagic, fertility enhancer, laxative, sexual enhancer, anti-microbial, anti-fungal (Tijani *et al.*, 2012). Thus, the use of these plants gained widespread as well in developing countries as in developed countries. Today, due to the side effects of western medicines (i.e. chemical drugs), drug tolerance, rise of the complications of the disease (despite careful management), and high financial implications imposed on society and individuals; the use of medicinal herbs and traditional medicine has become a priority globally (Zareiet *et al.*, 2015). Conversely, the widespread use and increasing popularity of herbal medicines does not guarantee their efficacy and safety (Shafaei, 2011).

Mitragynainermis is a savannas, forest and forest galleries shrub of 3-14 m in height and it is widely distributed in West to Central Africa (Senegal, Cameroon, Ghana, Ivory Coast, Mali, Chad, DR Congo and Sudan), where it is termed *Nkiwu*, *lèninFonorNago*, *kabe* in *dendi* (Akouegninouet *et al.*, 2006). Well known for its ornamental and medicinal purposes, *Mitragynainermis* medicinal applications however still depends as practiced by inhabitants of different geographical areas. In Benin, the aqueous decoction of root barks and leaves is used orally against anorexia, constipation and in steam bath against leprosy (Akouegninouet *et al.*, 2006). *Mitragynainermis* is reported to be used for the treatment of diabetes, ulcer, piles, dysentery and bone pain among the Hausa/Fulani tribes of northern Nigeria (Adoumet *et al.*, 2012). The hypotensive, cardiothoracic and vasodilatory properties of the aqueous extracts of the plant has also been reported (Ouedragoet *et al.*, 2004). Beyond its medicinal use, crude extract mixtures of leaves and stem from *M. inermis* showed good biopesticide activity against *Lepidopterous caterpillars* infesting plants of cotton (Ndiaye *et al.*, 2008).

The effects on haematological and biochemical parameters should be assessed in order to determine the safe and unsafe use of medicinal plants. Change from normal physiological levels of these parameters after administration of a chemical agent to an experimental animal is an indication of adverse effects of such agent on living organisms (Kolawole *et al.*, 2011). The present study is a preliminary work which contributes to a better knowledge on properties of medicinal plants used in traditional medicine in Benin for their alleged hepatoprotective and nephroprotective properties, especially *Mitragynainermis* of which phytochemical and toxicity are reported here.

Material and Methods:-

Preparation of plant extract:-

For the purpose of this study, the plant material used is composed of stem bark *Mitragynainermis*. Plant material was air-dried to constant weight at room temperature afterwards it was grounded into powder using an electric blender. The powder was then dissolved in distilled water for three days. After every 24 hours, the mixture was filtered through a Whatman filter paper and water was then added for the following 24 hours. Crude extract was collected by removal of water in oven at 40°C. The concentrated extract obtained was used for the trials. Phytochemical examinations of the extracts were carried out for detection of alkaloids, phenols, flavonoids, tannins, saponins, phytosterols, terpenes, glycosides and steroids following the method reported by Koudoro *et al.* (2014).

Experimental Animals:-

Male and female Wistar strain albino rats weighing between 140-200g were used for the purpose of this experiment. The animals were obtained from the Institute of Applied biomedical sciences (ISBA-FSS/FAST, Cotonou, Bénin, from Prof.Laleye) and kept in well ventilated and hygienic animal house of Animal Physiology and experimental pharmacology laboratory under constant environmental and nutritional conditions (18 to 22°C). All the rats were kept in cages and given food and water *ad libitum*.

Experimental Design:-

Animals were randomly divided into four groups of three rats each after body weight measurement to ensure homogeneity of the batches. The experimental groups (labelled group D1, D2, and D3) were administered 100 mg/kg of body weight, 1000 mg/kg of body weight and 2500 mg/kg of body weight of the extract respectively each day. The control group received distilled water. The administration was carried out for a period of 7 days and data was collected up to the 37th day.

Biochemical essays:-

The biochemical assays were performed using blood from the eyes of the rats and samples were collected three times. The first batch of samples were collected five days before drug administration (D0) from the rats was started and the second batch was done on the eighth day after the start of drug administration (D+7); with the third and last batch of samples collected on 37th day from the start of drug administration (D+30). Blood samples were collected into a clean dry test tube without an anticoagulant. The blood then was centrifuged at 3000 rpm for 10 minutes and the collected serum was used for estimation of biochemical parameters. Estimation of biomarkers for kidney (alanine aminotransferase (ALAT) and aspartate aminotransferase (ASAT)) and liver (urea and creatinine) functions were done using spectrophotometer KENZA MAX BioChemistry Photometer according to standard procedures provided along with the kits supplied by Biolab (France).

Data Analysis:-

The values of parameters were compared between groups using one-way analysis of variance (ANOVA) followed by Tukey multiple comparison tests. All the data analysis was performed using Minitab 16. Data was presented as mean \pm SD and significance was taken at $p < 0.05$

Results:-**Phytochemical group:-**

Table 1 showing phytochemical group identified into aqueous crude extract of *Mitragynainermis* reveal the presence of catechic tannins, alkaloids, flavonoids, saponosides, terpenes and sterols. However, compounds such as gallic tannins, anthraquinones and coumarins were absent.

Toxicity study of crude extracts of *M. inermis*:-

Along this part of our paper D0 means Starting day (Fives days before first gavage), D+ 7 means the day after the last gavage, D+ 30 means 30 days after the last force-feeding.

We recorded no particular signs of toxicity on animal during 24 hours following first drug administration. Recorded Signs are piloerection, convulsions, lethargy, diarrhea and sleep. The alive animals number was also recorded. From the following table 2, no death was recorded during the experimental period.

Change in body weight of rats administered with the aqueous extract of *M. inermis* are shown in figure 1.

As per figure 1, there was no significant variation of animals body weight during the experiment ($P > 0.05$) in all groups.

Figure 3:- Effect of extract on Liver function.

Effect of the drug administration on biochemical parameters:-

Effect on kidney function:-

Drug administration to rats at 100 mg/Kg BW and 1000 mg/Kg BW did not show any effect on the urea level in blood during the first 7 days and also after 30 days of observation. But at 2500 mg/Kg BW, the extract reduced significantly the urea level in blood (Fig.2 A). At 1000 mg/Kg BW, the extract significantly reduced the blood creatinine level that had been increased by the seven-day administration (Fig.2 B). The 2500 mg/Kg (BW) dose also reduced blood creatinine level after 30 days from the drug administration stop day.

At 100 mg/Kg (BW), the extract did not change the ALAT level in blood, but at 1000 mg/Kg (BW) and at 2500 mg/Kg (BW), the extract increased ALAT level significantly after seven consecutive days of drug administration (Fig.3 A). After 30 days, the normalization of ALAT level was noticed in group D2, which was significantly higher in comparison to the starting level and the control group (Fig.3 A). Blood level in ASAT was affected by seven-day administration of the extract at 2500 mg/Kg (BW) but normalized after 30 days of observation (Fig.3 A). Other doses (D1 and D2) didn't affect ASAT levels. 100 mg/Kg (BW) and 1000 mg/Kg (BW) doses did not induce significant changes, although there was a small variation after seven-day drug administration (Fig.3 A).

Discussion:-

In the current study, the phytochemicals found presented results similar to those of Konkonet *et al.* (2008) and those of Wakirwaet *et al.* (2013) in *Mitragynainermis* leaves extracts (infusion and decoction); however, contrary to the above mentioned studies saponosides was also present. Similarly to the current study, Ndiayeet *et al.* (2008) also reported finding saponosides besides other phytochemicals such as flavonoids, alkaloids and tannins. The main differences in the findings could be attributed to the difference in plant parts or solvent systems used in different studies. Indeed, these two research groups used *Mitragynainermis* leaves extracts (Konkonet *et al.*, 2008 and Wakirwaet *et al.*, 2013). Ndiayeet *et al.* (2008) used both leaves and stem bark whilst the present study used only stem bark extract for the phytochemical screening. This difference can also be attributed to climate and soil conditions of the harvesting areas (Olaleye, 2007).

The present study showed no particular signs such piloerection, convulsions, lethargy, diarrhoea and sleep. Moreover, after 37 days experimental period, no death within animals was recorded. Such results suggested that the crude aqueous extract of *M. inermis* do not possess acute toxicity up to 2500mg/kg of body weight in rats. Several research groups came to the same conclusion. Konkonet *et al.* (2008) using *M. inermis* leaves extracts estimated LD50 over 5000 mg/kg in mice and concluded that leaves freeze-dried aqueous extract of *M. inermis* was less toxic. Timothy *et al.* (2015) estimated the LD50 of the ethanolic extract of *M. inermis* stem bark at 1587.45 mg/kg for intraperitoneal route and at 4298.84 mg/kg for oral route. Atingaet *et al.* (2015) also concluded that methanol leaf extract *M.inermis* in mice is relatively less toxic after finding intraperitoneal LD50 to be more than 2000mg/kg of body weight. Furthermore, in the current study, the observation of less toxicity was reinforced by other research groups' conclusions using different solvents (water, methanol); in different animal (mice, rats) and different route (oral and intraperitoneal) (Timothy *et al.*, 2015, Uthmanet *et al.*, 2013, Adoumet *et al.*, 2012, Atingaet *et al.*, 2015, and Konkonet *et al.*, 2008).

The experimentation period did not affect animal's body weight suggesting that the crude aqueous extract of *M. inermis* doesn't affect animal appetite. Because kidney and liver toxicity has been reported following the use of phytotherapeutic products (Saadet *et al.*, 2006), biochemical parameters evaluation was important. In this study, it was determined the effect of a regular administration during one week of aqueous extract of two medicinal plants acclimated in Benin on rat serum creatinine, urea, ASAT and ALAT levels as bio-markers of kidney and liver activities. Since plasma urea concentration reflects the balance between urea production in the liver and urea elimination by the kidneys, its increase in plasma can be caused by increased urea production, decreased urea elimination, or a combination of the two. Urea is the dominant urinary osmole in most mammals and may be concentrated a 100-fold above its plasma level in humans and even more in rodents. The present study results showed a significant decrease in blood urea at 2500 mg/kg of body weight. This finding suggested that extracts could increase urea elimination by kidney acting on glomerular filtration rate (Higgins, 2016). Creatinine, which is a waste product in the blood that came from muscle activity and it, is normally removed from the blood by kidneys. Its levels rising when kidney function slows down. Generally, increased urea levels are associated with nephritis, renal ischemia and urinary tract obstruction (Guyton, 2012). Similarly, to urea, creatinine level is reduced significantly by drug administration at 1000 mg/kg and 2500 mg/kg of body weight. That observation supposed a nephroprotective effect of extract.

Transaminases are enzymes having significant metabolic activity within cells and their increase suggested a cellular lesion particularly in the liver, heart, kidney or muscular (Sanogo, 2008). Seven-day administration of the extract increased both ALAT and ASAT levels at 1000 mg/kg of body weight (ALAT) and at 2500 mg/kg of body weight (ALAT and ASAT). Interestingly, the levels of those parameters decreased and normalized after 30 days from drug administration date suggesting that the first seven days of drug intake can cause damage to either liver, heart, kidney or muscular cells.

Conclusion:-

The phytochemical screening in crude aqueous extracts from stem bark of *Mitragynainermis* revealed different phytochemical compound such as tannins, alkaloids, flavonoids, terpenes and sterols but saponosides was absent in leave *M. inermis*. The solvent and plant part used have been shown to be the main causes of the difference. Toxicological study allowed confirming the less toxicity of crude aqueous extracts from stem bark of *M. inermis* using oral route in rat wistar. Biochemical essay also revealed and confirmed less toxicity, suggesting the beneficial effect of the extract up to 2500 mg/kg of body weight for the liver; but the safety duration of the extract intake must be determined for the further pharmacological study of crude aqueous extract from stem bark of *M. inermis*. However, seven-day drug administration affect ALAT and ASAT levels negatively at 2500 mg/kg of body weight.

Abstract

Background & Aim: Hepatitis C virus (HCV) is a globally prevalent pathogen and a leading cause of death and morbidity. IFN-gamma inducible protein 10 kDa (IP-10, or CXCL10), predict a more pronounced first phase decline of HCV RNA during anti-viral therapy. We assessed pretreatment serum IP-10 as a predictor of SVR in treated chronic HCV.

Subjects and methods: Seventy adult chronic HCV patients were included in the prospective controlled study and 10 healthy subjects as a control group. All patients were treated with combined pegylated interferon and ribavirin therapy: pegylated IFN- α 2b, 1.5 μ g/kg/week or pegylated IFN- α 2a, 180 μ g/week SC plus ribavirin (15mg/kg/day orally) for 48 weeks and were followed up for 6 months later.

Results: There was statistically significant difference between the Non-SVR group and SVR group as regards IP10 level (395 ± 167.9 vs. 159.9 ± 55.2) pg/ml; AFP level (7.2 ± 1.4 vs. 3.8 ± 1.8) ng/ml and Liver Stiffness measurement by transient elastography (10.9 ± 6.3 vs. 7.4 ± 2.5) kpa, respectively. On multivariate regression analysis for predictors of post-treatment SVR: IP10 was the only independent predictor of achieving SVR (Odds=0.97; C.I 95%= 0.95-0.99; P=0.002). At cutoff point for IP10 more than 216.6 pg/ml has a sensitivity of 90%, specificity 87.5%, PPV 84.4% and NPV 92.1% at P = 0.001; C.I 95% = 0.900-1.000 to define patients with SVR.

Conclusion: Pretreatment IP-10 level should be included as a predictor of SVR. Attempts to neutralize IP-10 or block IP-10 receptor should be considered as additional strategies to improve the outcome of the antiviral therapy.

Introduction:-

Hepatitis C virus (HCV) is a global health problem with >185 million (2.8%) infections worldwide (Mohd et al, 2013). There is substantial regional variation where Egypt is estimated to have the highest HCV prevalence in the world (14.7%) (Cuadros et al., 2014).

As a consequence of asymptomatic progression of chronic HCV infection, almost 75% of patients first present with complications of cirrhosis, portal hypertension and later develop hepatocellular carcinoma (HCC) (Mitchell et al,

Corresponding Author:- Mohamed Abdel-Samiee.

Address:- Hepato-Gastroenterology, National Liver Institute, Menoufia University, Shebin El-Kom, Menoufia, Egypt.

2010). Some estimations suggest that death related to HCV infection (due to liver cell failure or hepatocellular carcinoma) will increase over the next two decades (**Ghany et al., 2009**).

Cellular immune response induced to HCV may affect the severity of liver injury. Inflammatory responses are regulated by complex mechanisms and probably depend on genetic determinants such as HLA expression and chemokines such as interferon-gamma-inducible protein-10 (IP-10) (**Hraber, 2007 and Larrubia, 2008**).

The treatment regimen with pegylated interferon (PEG-IFN) alfa-2a or alfa-2b together with ribavirin (RBV) was the standard of care (SOC) for HCV patients (**Alexopoulou & Karayiannis, 2015**). With improved understanding of the HCV genome, key viral enzymes and life cycle, direct-acting drugs (DAAs) have developed, that show good promise for the future (**Alexopoulou & Karayiannis, 2015**).

Response to treatment is affected by various viral and host factors. Among the identified predictors of response, the host genetic polymorphisms and the pre-treatment activation of IFN-stimulated genes (ISG) (**Kau et al, 2008, Fattovich et al, 2011**).

Single nucleotide polymorphisms (SNPs) near IL28B, which encodes the type III interferon IFN- λ 3, can be used in routine clinical practice for informing treatment decisions. IFN- λ 3 are strongly associated with the response to treatment of chronic hepatitis C, it up regulates IFN-stimulated genes and affects the adaptive immune response (**Rauch et al, 2010; Thompson et al, 2010**). However, the IL28B genotype alone is not a perfect predictor of treatment outcome (**Ogawa et al., 2012**).

On the other hand, it has been shown that low levels of intrahepatic and systemic chemokine CXCL10 (IP-10, or CXCL10), a valid surrogate marker of ISG activation, predict a more pronounced first phase decline of HCV RNA during anti-viral therapy (**Askarieh et al, 2010**) and increased SVR rates (**Romero et al, 2006**).

HCV itself is suggested to be responsible for elevated serum IP-10 levels found in HCV-infected patients. HCV proteins such as NS5A and core, alone or in combination with proinflammatory cytokines, can induce IP-10 gene expression and secretion (**Apolinario et al., 2005**). Pretreatment IP-10 levels correlated with HCV viral load, ALT levels, hepatic inflammation and fibrosis. Potent DAA therapy is associated with a rapid reduction in plasma IP-10 level that parallels the reduction in HCV RNA level, both in treatment-naïve patients and treatment-experienced patients (**Chatterjee et al., 2012**).

Aim:-

The aim of this work was to assess pretreatment serum IP-10 as a predictor of SVR in treated chronic HCV Egyptian patients

Subjects and Methods:-

This prospective controlled study was conducted on 70 patients with chronic hepatitis C virus infection. They were recruited from the outpatient clinic of Hepato-Gastroenterology department, National Liver Institute, Menoufia University. All patients were ≥ 18 years old, and eligible for pegylated interferon plus ribavirin therapy. Diagnosis of chronic HCV was confirmed by real-time PCR. Patients underwent antiviral treatment and follow-up protocol according to the standard clinical practice for 18 months. In addition, 10 apparently healthy subjects of matched age and gender were enrolled as a control group. The study was approved by the ethics committee, and enrollment in the study was conditioned by a written informed consent from all participants in the study.

Exclusion criteria:-

1- Previously treated, or not eligible for treatment. 2- Patients with HBV or HIV coinfection. 3- Patients with evidence of HCC or other liver diseases. 4- Patients having moderate to severe uncorrected anemia, neutropenia and thrombocytopenia. 5- Patients with a history of cardiovascular and neuro-psychiatric diseases.

All patients were treated with combined pegylated interferon and ribavirin therapy: pegylated IFN- α 2b 1.5 μ g/kg/week or pegylated IFN- α 2a 180 μ g/week SC per week, plus ribavirin 15mg/kg/day orally. Patients received treatment for 48 weeks and were followed up for 6 months after the end of treatment.

A rapid virological response (RVR) was defined as undetectable HCV RNA in serum at week 4 of therapy. Early virological response (EVR) was defined as serum HCV RNA negativity or any $>2 \log_{10}$ decline in HCV RNA levels at week 12 of therapy compared with baseline. Patients with sustained virological response (SVR) were those with undetectable HCV RNA in serum 24 weeks after stopping therapy. Treatment failures included patients who had a $< 2 \log_{10}$ drop in viral load at week 12 as compared to baseline, those whose HCV RNA was still detectable at week 24 (i.e. nonresponders), and those who had undetectable HCV RNA at the end of therapy but detectable HCV RNA at 24 weeks after cessation of therapy (i.e. relapsers) (Ghany et al., 2009).

Laboratory Assessment:-

Base line investigation; blood samples were taken before starting treatment. They were tested for: HCV RNA using the COBAS® TaqMan® HCV Quantitative Test (Roche Molecular Diagnostics, CA, USA) with lower limit of quantitation of 15 IU/ml; complete blood count (CBC) using Sysmex K-21 (Sysmex Corporation, Japan); blood sugar, liver & kidney function tests using fully automated Beckman Coulter chemistry analyzer Au 480 (Beckman Coulter Inc., CA, USA); alpha fetoprotein (AFP) & TSH hormone using (Advia Centaur CP immunoassay system, Siemens Healthcare Diagnostics Inc, USA)

Repeated measurements of liver function tests, complete blood count and HCV RNA were done on weeks (12, 24, and 48) during treatment and at 6 months after stopping therapy.

End Points:-

SVR response was considered as primary end point. Non-response and/or relapse were considered as the secondary end point.

Quantification of serum level of IP-10:-

Interferon- γ Inducible Protein -10 (IP- 10) levels were measured in serum samples (separated and stored at -80°C) using a solid phase sandwich ELISA immunoassay (Quantikine human CXCL10 / IP10 immunoassay, R&D System, Minneapolis, USA) according to the manufacturer's instructions.

Liver biopsy:-

Ultrasound-guided percutaneous liver biopsy was performed to determine the degree of liver fibrosis at baseline. The histopathological assessment of necro-inflammatory grade and fibrosis stage was recorded using Metavir scoring system (Fibrosis was staged on a 0-4 scale. Activity was graded as: A0, none; A1, mild; A2, moderate; and A3, severe. Fibrosis stages \geq F2 were considered significant) before commencing treatment (Bedossa et al., 1996).

Radiological investigations:-

All patient had abdominal ultrasonography; liver stiffness measurement (LSM) by transient Elastography using fibroscan apparatus ((Echosens, Paris, France) done initially within a week of liver biopsy and at the end of follow-up period (Andersen et al., 2009).

Statistical analysis:-

Data was statistically analyzed using IBM® SPSS® Statistics® version 21 for Windows. Data are expressed as mean \pm standard deviation, number with column percentage and the median \pm range or 95% confidence interval for non-parametric data. All p-values are 2 tailed, with values <0.05 considered statistically significant, $p = 0.01$ is highly significant and $p = 0.001$ is very highly significant. Comparisons between two groups were performed using the Student's t-test for parametric data "normally distributed", and Mann-Whitney test for nonparametric data "not normally distributed". CHI-squared test (χ^2) and Fisher exact test for categorical data analysis. Regression analysis is used to find how one set of data relates to another. Univariate and multivariate binary logistic regression were done for detecting the predictors of the event.

The area under the receiver operating characteristic (AUROC) curve analysis was used for detection of the cutoff value of the proposed tests. An AUROC value of 0.90-1.0 indicated excellent, 0.80-0.89 good, 0.70-0.79 fair, 0.60-0.69 poor and 0.50-0.59 no useful performance for discrimination of the outcome under assessment. **Sensitivity:** the proportion of patients with disease who are correctly identified. **Specificity:** the proportion of patients without disease who are correctly identified. **Positive predictive value:** the proportion of patients with positive test results who are correctly diagnosed. **Negative predictive value:** the proportion of patients with negative test results who are correctly diagnosed.

Results:-

This was a prospective randomized controlled study which was conducted on 70 chronic hepatitis C patients and 10 healthy persons enrolled as a control group. They were recruited from the outpatient clinic of Hepatology department, National Liver Institute, Menoufia University.

Comparison between control group and treated group:-

There was statistically significant difference between both groups regarding **Albumin** (4.4 ± 0.4 vs. 4 ± 0.2) g/dl, **AST** (21.3 ± 4 vs. 49.6 ± 38.2) U/L, **ALT** (29.9 ± 4.2 vs. 53.7 ± 39.2) U/L, **Creatinine** (0.7 ± 0.1 vs. 0.8 ± 0.2) mg/dl, **Platelets** (253900 ± 56398.3 vs. 6734.4 ± 2165.5) /mm³ and **IP10** (102.2 ± 51 vs. 260.7 ± 165.2) pg/ml in the control group vs. treated group respectively.

However, there was no statistical difference between both groups regarding **age, TSH, RBS, AFP, bilirubin, WBCs, Hb, Prothrombin conc. And INR**

The mean \pm SD of transient elastography was (8.9 ± 4.8) kpa in the treated group patients before starting treatment. The base-line HCV RNA level was (1548683.5 ± 1955482.9) IU/ml in treated group (table 1, Figure 1)

Comparison between sustained vs. non sustained virus responders:-

Sustained virus response (SVR) comprise 57.1% of chronic hepatitis C patients as 40 patients achieved SVR while 30 patients were Non-SVR achievers, who were further subdivided to 20 non responders who did not achieve the end of treatment (EOT) and 10 relapsers (achieved EOT but not SVR).

There was statistically significant difference between the Non-SVR group and SVR group as regards **IP10 level** (395 ± 167.9 vs. 159.9 ± 55.2) pg/ml (table and figure 2); **AFP level** (7.2 ± 11.4 vs. 3.8 ± 1.8) ng/ml and **Liver Stiffness measurement by transient Elastography** (10.9 ± 6.3 vs. 7.4 ± 2.5) kpa, respectively (table 2, figure 3). On the other hand, there was no statistically significant difference between the two groups as regarding **age, bilirubin, albumin, AST, ALT, creatinine, hemoglobin, WBCs, platelets, prothrombin conc., INR and base line HCV RNA level** (table 2)

However, there was a significant difference between the two groups regarding the presence of significant fibrosis ($F \geq 2$) ($P = 0.009$) (table 3) and activity ($P = 0.023$) by Metavir scoring (table 4). Furthermore, there was a significant difference between both groups regarding the achievement of RVR (rapid viral response), EVR (early viral response) and EOT (end of treatment response). As 37 (92.5 %) RVR achievers ($P = 0.023$) (table 5, figure 4), 39 (97.5 %) EVR achievers ($P = 0.001$) and 40 (100%) patients who achieved EOT were SVR achievers ($P = 0.001$) (table 6, figure 4).

Comparison between patients with non-significant fibrosis and patients with significant fibrosis:-

There was statistically significant difference between both groups as regarding **age** which was significantly higher in patients with significant fibrosis than in those with non-significant fibrosis (47.5 ± 7.8 vs. 39.7 ± 10.6 years old). **Prothrombin conc.** was significantly lower in patients with significant fibrosis (83.7 ± 10.2 vs. 89.3 ± 8.6) and **INR** was significantly **higher** in patients with significant fibrosis than in those with non-significant fibrosis (1.2 ± 0.1 vs. 1.1 ± 0.1).

RBS and Transient Elastography were **higher** in patients with significant fibrosis than in those with non-significant fibrosis with values (121.6 ± 37.7 vs. 100.8 ± 17.7 mg/dl) and (15.4 ± 6.5 vs. 7.1 ± 1.9 kpa) respectively.

On the other hands, there was no statistical significance between two groups concerning **IP10, Bilirubin, Albumin, AST, ALT, Creatinine, Hb, WBCs, Platelets, AFP, TSH and base-line HCV RNA level** (table 7).

However, there was a significant difference between the two groups regarding **SVR** as 11 out of 15 patients (73.3%) with significant fibrosis were Non-SVR achievers vs. 19 out of 55 patients (34.5 %) with non-significant fibrosis were Non-SVR achievers ($P = 0.009$) (table 8).

Predictors of treatment:-

On multivariate regression analysis for Predictors of post-treatment SVR **IP10** was the only independent predictor of achieving SVR (Odds=0.97; C.I 95%= 0.95-0.99; $P=0.002$) (table 10).

At cutoff point for IP10 more than 216.6 pg/ml has a sensitivity of 90% and specificity 87.5% and PPV 84.4% and NPV 92.1% at P = 0.001; C.I 95% = 0.900-1.000 to define patients with SVR (figure 6).

Table 1:- Baseline characteristics of treated group vs. control group

	Groups		P-value	Treated Group		P-value
	PegINF/RBV N=70 M \pm SD	Control N=10 M \pm SD		SVR N=40 M \pm SD	Non-SVR N=30 M \pm SD

Discussion:-

There are many estimates of the number of people in Egypt that are infected. Many publications suggest that nearly 14 % of the people in Egypt were infected. This is ten times greater than in any other country in the world (Sievert et al., 2011). The genotype 4 is predominant in 91% of these patients (Guerra et al., 2012).

The combination therapy with interferon- α and ribavirin, neutralize the virus after 6 months in 40-50% of the infection cases with genotype 1 and in 80% of the infection cases with genotype 2 and 3 (Schuppan et al., 2003). Infections of HCV genotype 4 is, as genotype 1, relatively resistant to the interferon- α /ribavirin combination therapy medical treatment (El Makhzangy et al., 2009). A major paradigm shift happened in HCV treatment, with the advent of highly effective, simplified and short duration (12 weeks) oral DAA-based regimens (Dore et al., 2012). However, the effect of these new therapies, even in developed countries, will be modest without expanded access to treatment (Thomas et al., 2010).

Host genetic factors may predict the outcome and treatment response in HCV infection. IFN- γ -inducible protein 10 (IP-10; also known as CXCL-10) is a member of the CXC subfamily of chemokine. It is induced in monocytes, fibroblasts, and endothelial cells by IFN- γ . IP-10 stimulates monocytes, natural killer cell, and T-cell migration and acts as a chemoattractant for CXCR3 +T cells. Baseline plasma IP-10 levels reflect intrahepatic levels and are a prognostic marker of treatment outcome for patients treated with pegylated interferon and ribavirin (Askarieh et al., 2010).

IP-10 decrease to baseline in those who spontaneously clear infection but remain elevated in those who develop chronic infection suggesting that HCV infection itself is driving the elevated IP-10 levels (Chattergoonn et al., 2011).

The aim of this study was to assess the efficacy of serum IP-10 as a predictor of SVR in chronic hepatitis C virus Egyptian patients receiving Peg-IFN and RBV therapy. This was a prospective study which was conducted on 70 patients with chronic hepatitis C. In addition, 10 healthy persons with matched age and sex were enrolled as a control group.

Patients were categorized into two groups according to their sustained virological response (SVR). **Group (1):** patients who achieved SVR. **Group (2):** patients who didn't achieve SVR including non-responders and relapsers.

SVR was achieved in 40 patients (57.1%) while 30 patients were Non-SVR achievers (42.9%); 20 of them were non-responders and 10 were relapsers. These results coincide with Gad et al. (2008) who reported that SVR rate was 54.8% in genotype-4. Another study conducted on 88 Egyptian patients with chronic HCV infection naive to treatment with PEGIFN/RBV reported SVR rate of 39.8% (El Razikyet al., 2015).

As regards **age and gender distribution** we revealed that no statistically significant difference was found between SVR and Non-SVR groups ($p=0.2$, 0.13 respectively). Previous studies showed that younger age of patients was a significant predictor of treatment response (Codes et al., 2007; Antonucci et al., 2007; Assad et al., 2014). However, the significance of age has not been observed concordantly with other reports. Shiffman et al. (2007) showed that older age, was not an unfavorable marker for IFN α treatment. In addition, Adnan et al. (2013) reported a non-significant relationship between age and response to IFN therapy. This discrepancy may come from weak power of significance and/or differences in sample size.

Several reports (Codes et al., 2007; Assad et al., 2014) showed that female sex was a significant predictor of treatment response. In addition, Di Marco et al. (2013) reported that menopause is related to an increased severity of liver fibrosis, and a lower likelihood of response to therapy with peg-IFN and ribavirin.

The decreased rate of a complete response to IFN α treatment may correspond to decrease in estrogen levels. Interleukin 1, associated with an inflammatory response, is stimulated by low concentrations of estrogen and progesterone. A low concentration of estrogen allows peripheral blood monocytes to secrete more interleukin 1. The spontaneous production of interleukin 1 by peripheral mononuclear cells has been shown to be significantly higher in patients with CHC than in healthy control individuals, and decreased in those with a complete response after the administration of IFN α . This cytokine production may alter the effectiveness of IFN α treatment in perimenopausal and menopausal women with CHC infection (Di Marco et al., 2013).

It is well known that advanced fibrosis or cirrhosis is a poor prognostic factor for response to antiviral therapy compared with no or minimal fibrosis (**Poyfriedard et al., 2000; Poynard et al., 2002; Fried et al., 2002; Hadziyannis et al., 2004; Everson et al., 2006**). In agreement with these studies; we found that SVR was significantly higher in patients with non-significant fibrosis than in patients with significant fibrosis as (73.3% vs. 34.5 %; $P = 0.009$).

In addition, we found that the mean of Transient Elastography was significantly higher in Non-SVR achievers (10.9 ± 6.3) KPa than in the SVR achievers (7.4 ± 2.5) KPa. This was matched with **Stasi et al. (2015)** who showed that liver stiffness (LS) >12 KPa prior to the initiation of dual therapy was significantly associated with poor response to therapy ($p < 0.025$). LS >12 KPa should be considered a strong prognostic indicator of non-response to anti HCV treatment (**Martinez et al., 2012**).

In our work, we found that RVR was a significant predictor of SVR. Thirty seven patients (92.5 %) of forty SVR achievers were RVR while twenty one patients (70%) of thirty Non-SVR achievers were RVR ($P = 0.023$). This was coincided with a study conducted by **Ferenci et al. (2004)**, he observed that patients infected with HCV genotypes 2 or 3 achieved RVR in higher proportions than patients infected with genotype 1. However, regardless of the HCV genotype, patients who reached RVR have the highest rates of SVR. In the study by (**Fried et al., 2011**) RVR was achieved by 16% of patients with genotype 1, 71% of genotype 2 and 60% of genotype 3. Among individuals who reached RVR, the SVR rate was high across all HCV-genotypes and ranged from 88% to 100% (genotypes 1-4) (**Mangia et al., 2010**).

Also in our study, we found that there was statistically significant difference between SVR achievers and Non-SVR achievers as regarding achievement of EVR as 39 (97.5 %) patients who achieved EVR were SVR achievers ($P = 0.001$). This was matched with a study from China which showed that patients without EVR rarely achieve SVR (**Reddy et al., 2005**).

In our work we found that, **AFP** level, was **higher** in Non-SVR achievers than in SVR achievers (7.2 ± 11.4 vs. 3.8 ± 1.8 ; $p = .03$). This was matched with **Males and colleagues in 2007** who confirmed the predictive role of AFP concerning treatment response to chronic hepatitis C. In a previous study, serum AFP remained independently associated with SVR after controlling other factors associated with SVR, including liver fibrosis (**Dabeva et al., 1993**).

Previous studies have shown that AFP can be considered as one of the serological predictors of response to antiviral therapy (**Abdoul et al., 2008**) as SVR to Peg-IFN α /RBV was associated with a decrease in serum AFP (**Kasztelan et al., 2003**).

In our study, **IP10** level was 260.7 ± 165.2 pg/ml in the treated group. High serum IP-10 levels were associated with a failure to achieve SVR. IP-10 levels were significantly lower in patients who achieved SVR pg/ml than in Non-SVR achievers (159.9 ± 55.2 vs. 395 ± 167.9 pg/ml; $p = 0.001$). While there was no statistically significant difference between patients with significant and non-significant fibrosis regarding IP -10 ($P = 0.5$). This was matched with a study done in **Cairo University, Egypt** which included 80 treatment naïve HCV patients. Pretreatment serum IP-10 levels were significantly lower in patients who achieved SVR than in non-responders and they concluded that low pretreatment serum IP-10 is a favorable predictor of response to antiviral HCV therapy in Egyptian patients (**Omran et al., 2014**).

Also our results were matched with another study done on 104 Japanese, genotype 1 CHC individuals treated with PEG-IFN/RBV and 45 treated with PEG-IFN/RBV/telaprevir, and evaluated the impact of pretreatment serum IP-10 concentrations on their virological responses. They concluded that pretreatment serum IP-10 concentrations are associated with treatment efficacy in PEG-IFN/RBV and with early viral kinetics of HCV in PEG-IFN/RBV/telaprevir therapy (**Matsuura et al., 2014**).

Diago et al. (2006) reported the association of serum IP-10 levels with SVR to (PEG-IFN/RBV) therapy in patients with genotype 1 chronic HCV. They showed that the levels of IP-10 were lower in SVR patients. Noteworthy, after successful antiviral therapy, serum IP-10 concentrations decreased to levels lower than baseline, whereas they were unchanged in non-responders, suggesting that HCV itself may be responsible for elevated serum IP-10

concentrations found in HCV-infected patients, and thus, pretreatment serum IP-10 is an independent predictive factor of SVR in HCV patients infected by genotype 1.

On contrary; **El Razikyet al (2015)** found that the pretreatment serum IP-10 levels were not significantly different in relation to different grades of necro-inflammatory activity and fibrosis stages. Verifying the predictive value of pretreatment serum IP-10 levels, their study did not find a significant relation to response at week 12, 24, 48, and 72. Concentrations lower than 594.1 pg/mL had a positive predictive value of 86.8% in their study population. Also, **Reiberger et al in 2008** did not find a clear association between IP-10 levels before or during treatment and SVR. Also, **Yoneda et al in 2011** did not confirm the association between a low baseline IP-10 level and SVR. Other reports confirmed these findings; no difference was seen in baseline IP-10 levels between CHC patients with or without RVR (**Falconer et al., 2010**) or with or without SVR (**Wan et al., 2009**).

In our study, we found that a cutoff point for IP10 more than 216.6 had a sensitivity of 90% and specificity 87.5% and PPV 84.4% and NPV 92.1% ($P=0.001$; C.I 95%= 0.900-1.000).

IP-10 has a chemotactic function on different cell types following binding to its receptor. IP-10 recruits T lymphocyte subsets expressing the CXCR3 receptor, including activated T lymphocytes of the T helper type 1 phenotype. Also, cytotoxic T cells and NK cells express CXCR3 and are targeted by the IP-10 chemotactic effect (**Zeremski et al., 2008**).

IP-10 is upregulated in the liver cells infected by HCV since strong IP-10 staining was found in the cytoplasm of the hepatocytes but not in other liver cells. It has been suggested that HCV itself may be responsible for elevated serum IP-10 levels found in HCV infected patients. HCV proteins such as NS5A and core, alone or in combination with pro-inflammatory cytokines, can induce IP-10 gene expression and secretion in human hepatocyte derived cells, leading to the accumulation of CXCR3 expressing T lymphocytes in the liver. IP-10 expression may also provide important retention signals, resulting in the observed accumulation of T lymphocytes (**Apolinario et al., 2005**).

Thus, the mechanism by which IP-10 induces treatment failure may be explained by its role in the recruitment of effector Th1 lymphocytes into the liver cells of chronic HCV patients and its potential in contributing to the host immune response against the virus as well as to the disease progression. Also, IP-10 modulates the efficacy of IFN- α plus ribavirin therapy by enhancing the expression of the HCV NS5A protein which induces IL-8 (CXC chemokine) secretion. IL-8 was also found to be associated with the inhibition of the antiviral effects of IFN- α (**Zeremski et al., 2008**).

We can assume that HCV and IP-10 have synergistic effects towards each other; HCV induces IP-10 secretion by the hepatocytes, and IP-10 stimulates viral replication and inhibits the antiviral effects of IFN- α (**Apolinario et al., 2005**).

It was found that circulating CXCL10 is indeed processed into the shorter form and turns it into a CXCR3 antagonist. It was demonstrated that the short, antagonist form of CXCL10 predominates in the plasma of chronically infected patients who are destined to fail anti-HCV therapy and thus is responsible for the lack of desired antiviral effects of IP-10 and could play an important role in pathology (**Casrouge et al., 2011**).

Thus, IP-10 is a strong negative predictor of response to Peg-IFN/Ribavirin therapy in HCV-4 mono-infected patients. This highlights the need to consider this factor in the individualization of treatment, and augments the level of predictiveness of IL28B polymorphisms for final treatment outcome (**Charles and Dustin, 2011**). As IP-10 may play a role in the mechanism of failure of antiviral therapy, interventions neutralizing endogenous IP-10 or blocking the function of its receptor, CXCR3, may provide new strategies to improve the treatment outcome of these difficult-to-cure patients (**Charles and Dustin, 2011**).

Our study has limitations as it was conducted on a small number of patients and this population contained small percentage of patients with significant viremia and significant fibrosis. Data may not be generalizable to other study populations. Also, we did not analyze the IL-28 B polymorphism in our cohort which may interact with our results.

In conclusion, we found a strong association between low pretreatment IP-10 levels and SVR in HCV infected Egyptian patients. Pretreatment serum IP-10 level should be included as one of the predictor of response to therapy.

Attempts to neutralize IP-10 or block IP-10 receptor should be considered as additional strategies to further improve the outcome of the antiviral therapy.

Further studies with larger samples are needed to determine the association of IP-10 and HCV treatment response especially with DAA therapy.

Abstract

Science does not flourish in vacuum. There is a connection between science and its application. Scientific discoveries need to be translated into practical applications in order to improve health and well-being of mankind. Many discoveries typically began at “the bench” with basic research in which scientists studied disease at a molecular or cellular level then progressed to the clinical level, or the patient's “bedside. It is important that basic research and applied research need to go hand in hand to provide complete answers for many research questions. Translational research in nursing is an emerging area of interest for many. Translational research conveys different meaning to different people, but it seems it is important to everyone. Hence this review is intended to highlight the concept of translational research, its need and applicability in the field of nursing.

Introduction:-

Translational research has become an extremely popular buzzword in the world of biomedical research lately and was designed for the medical world. It emerged in response to concern over the long time lag between scientific discoveries and changes in treatments, practices, and health policies that incorporate the new discoveries(1).

Translational research is broader than the traditional term “applied research.” Applied research is any research that may possibly be useful for enhancing health or well-being. It does not necessarily have to have any effort connected with it to take the research to a practical level. For example, an applied research study might analyse longitudinal data that tracks participants’ health and social relationships. But in translational research, the same researchers would partner with a community and ask for ideas about how their findings might apply there. Together, they would come up with an intervention plan that would also include scientific evaluation of its effectiveness (2).

Definition:-

Research that translates scientific discoveries and advances from the bench or laboratory into a clinically germane application (1).

“Translational research in nursing is scientific investigations of methods, interventions and variables that influence adoption of evidenced based practice by individuals and organizations to improve clinical and organizational decision making in health care” (3).

Need for translational Research:-**Knowledge - Practice Gap:-**

The 'knowledge driven model' was used within the medical field assumed that basic research would progress to applied research and would eventually lead to development stages, such as new medicine or technology and then application in the realm of practice. Example it took 200 years for convincing cure for scurvy (4).

Cultural Differences:-

Early knowledge-driven and problem solving models reduced interaction to one-way due to cultural and value differences between academicians and decision makers (4).

Research and Practice Gap:-

Expanding research literature being difficult to access in a timely fashion, gaps in the current understanding of health and disease processes, and the difficulty of interpreting the results of research publications, there remains also the tension of conjoining a knowledge base from a scientific research community with that of clinical communities (2).

Evidence Based Movement:-

Focused the two-way nature of knowledge flows and the need for active engagement, rather than passive diffusion. Rather than assessing knowledge flow solely by the efficiency of outcomes, the conceptual focus shifted on the process of interaction and collaboration. Also, while EBM reconciled the volitional variations involved in the problem selection and analysis around the logic of efficiency, the emerging conceptualizations of knowledge exchange considered and reconciled cultural differences in a symmetrical and reciprocal interaction of researchers and practitioners (5,6).

Emergence of the research translation Models:-

Emphasize interactions between researchers and decision-makers in developing and implementing research in practice (2).

Components of Translational Research:-

There are two areas of translation.

- Type One Translation (T1): It is the process of applying discoveries generated during research in the laboratory, and in preclinical studies, to the development of trials and studies in humans. Usually called "bench to bedside," (i.e., services, programs, practices and products etc.).
- Type two Translation (T2): this area concerns research aimed at enhancing the adoption of best practices in the community. Cost-effectiveness of prevention and treatment strategies is also an important part of translational science. (e.g., health care settings, community-based organizations, schools etc.) (2,5).

Translational Research - A Collaborative Approach:-

Enhancing team science to improve its ability to work across disciplines and professions is the major hallmark of 21st century science and is now commonly seen as the key for advancing translational research. Team science may make use of a range of modalities:

- ★ Multidisciplinary: Coordination of research among scientists of different backgrounds and disciplines.
- ★ Interdisciplinary: Cooperative effort of scientists on issues that fall between disciplinary boundaries.
- ★ Transdisciplinary: Collaborative projects where information exchange, the modification of scientific approaches, and the integration of scientists and approaches from different disciplines advances research toward a common scientific goal (7,8).

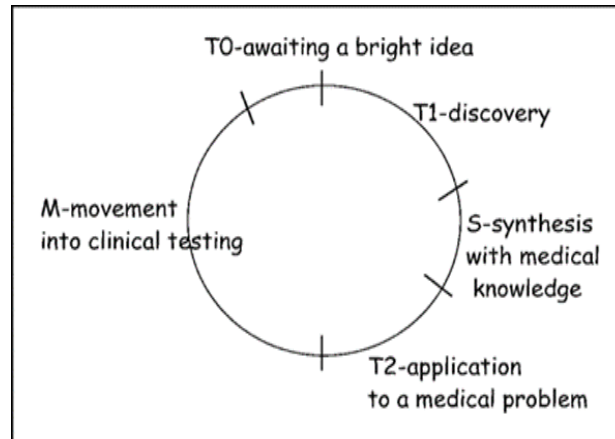

Translational Research Cycle:-

"Translational research cycle", includes several identifiable stages and clearly defined checkpoints. Each phase has its unique features. For example, the resting phase (T0) requires the generation of a great idea and the formulation of that idea into a testable hypothesis.

The testing phase (T1) is when the great idea is subjected to interrogation through scientific inquiry. This hypothesis testing requires the assembly of a research team that includes students, postdoctoral fellows, and more established scientists. The principal investigator or team leader must acquire funding for the project and show that progress is

being made. With a combination of luck, skill, and tenacity, a discovery will occur that may become the basis for translation.

The synthesis phase (S) requires the ability to identify the potential importance of a discovery to a clinical problem. This is often dependent on mechanisms to place fundamental information in front of people who understand the scientific basis of medicine and are familiar with medical problems.

Movement into the application phase (T2) requires the ability of researchers to determine the importance of a discovery to human biology. Here, the team of investigators must have access to human tissue and body fluids, predictive animal models, as well as pathologists, pharmacologists, surgeons, and biostatisticians.

The movement phase (M) is where preclinical studies enter the clinic. Now the research team must expand to include practicing physicians, nurses, research coordinators, toxicologists, informaticians, regulatory experts, lawyers, and a variety of other seemingly unrelated species. Ironically, as the discovery moves closer to human application, the science tends to get less sophisticated, yet the funding gets more difficult (9).

Translational Research in Nursing:-

In recent decades, the initiatives to develop individual, collaborative, or multicentric nursing research have multiplied throughout the world. The objective of such initiative has been to improve the quality of nursing care given, offering greater security to patients and influencing more effective health care policies. Research based on evidence, clinical research, systematic literature reviews, convergent care research, phenomenological studies, and social representations all share the same objective: to respond to professional practice questions. However, despite all the knowledge such efforts have produced, there is a vacuum among the studies and the use of the results from research carried out in public or hospital health care services. Translational research, with its mantra "bench to bedside and back," emerged as a top priority in the field of nursing has arisen in an attempt to fill in the vacuum and approximate the researcher to fields of practice (10).

Clinical and translational Research Center Nursing: nurses skilfully combine both the clinical and research aspects of patient care. With patient safety a priority, maintaining the highest standards of research conduct, utilizing expert clinical judgment, critical judgment, critical thinking skills, and a patient-centred approach are the key components which are emphasised (8).

Nursing Leadership in Translational Research:-

Nurses should assume leadership for the majority of translational science projects in hospitals. Nurses need to identify optimal mechanisms for enriching the care provided in the more remote communities. Also, nursing has had long-established historical efforts at studying broad range outcomes in health care, which positions them very well to lead, including establishing institutes focusing on translation within hospitals and health systems. Nursing homes and other long term care services and home care should be very high on the priority list. Given nursing's commitments to address health disparities, they must assume more leadership responsibilities for translational research that illuminates how the communities at greatest risk can benefit from the very expensive work they are all doing. It is not good enough to continue to generate studies that show how one can change health and health care in

communities that have access to high quality health care as well as adequate housing, nutritionally adequate diets, and good health education. Nurses should be devoting more of their efforts to the census tracts in inner city and rural areas (4).

Future of Translational Research in Nursing:-

Nurses must engage immediately and assertively in setting an agenda for translation of their research to practice in health care systems and to public. In order to achieve this, nurses need to focus on three sectors: traditional, mainstream health services including complementary and alternative health services and community health services, and the general public.

- ✦ Nurses must be visible and vocal on focusing on the areas in which nurses have expertise. Nurses should expect that they exist to embrace, advance, and translate nursing science, given that nurses have been contributing to clinical sciences
- ✦ Nurses should make their translational science models visible, and their efforts should be supported by federal agencies.
- ✦ Contemporary communication Medias have a great reach and nurses should use them more effectively to promote health and health-care. Nurses need to author articles and books for the public and contribute to internet sources designed to translate research findings to the public for their benefit.
- ✦ If nurses are truly committed to translation of research in practice, they will resolve to educate clinicians who are capable of the translational work necessary to truly achieve this goal (11).

Conclusion:-

Although the science of translating research into practice is fairly new, there is some guiding evidence of what implementation interventions to use in promoting patient safety practices. However, there is no magic bullet for translating what is known from research into practice. To move evidence-based interventions into practice, several strategies may be needed. Nurse scientists must reevaluate how proposed research fits within and contributes not only to the development of new knowledge, but to the translation of that knowledge to the care of diverse communities and populations.

Spodoptera littoralis, lavender oil, mint oil, *Catharanthus* extract, *Artemisia* extract, toxicity, feeding deterency.

Abstract

The sensitivity of *Spodoptera littoralis* 2nd and 4th instar larvae towards the essential oils (mint and lavender oils) and aqueous plant extracts (*Artemisia herba-alba* and *Catharanthus roseus*) were investigated under laboratory conditions and the effect of sublethal concentrations on the feeding deterrence were evaluated on the insect. Results revealed that 2nd and 4th instar larvae of *S. littoralis* were more susceptible to lavender oil than mint oil as it has higher LC₅₀ values. In addition, the results showed that the mean feeding deterrence (FDI%) of essential oils and botanicals extracts was concentration-dependent. Therefore, these botanicals could be important as eco-friendly accessible pest control alternatives against *S. littoralis* and other closely related species.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

The Egyptian cotton leafworm, *Spodoptera littoralis* (Boisd.) (Lepidoptera: Noctuidae) is one of the most destructive pests of several crops such as cotton, corn, peanut, clover, vegetables and various fruits in Egypt as well as in Mediterranean and Middle East countries (El-Sinayet *et al.* 2008 and El-Zoghby *et al.* 2011). The continuous and unwise use of insecticides to control agricultural pests usually lead to development of resistance, adverse effects on beneficial insects and residues in foods (Rizket *et al.* 2010 and Ehab 2012). The essential oils and other plant extracts, as a new class of natural products for controlling insect pests environmentally friendly have begun to play an increasing prominent role as alternatives to synthetic insecticides (El-Sinayet *et al.* 2008; Tripathi *et al.* 2009 and Ragaei and Sabry 2011). The selected essential oils and the botanical extracts used in this study are among those compounds under investigation as potential biopesticides.

Materials and Methods:-

Insect rearing:-

The colony of cotton leafworm, *Spodoptera littoralis* (Boisd.), was obtained from the division of the cotton leafworm, Plant Protection Research Institute, Dokki, Egypt. Larval stages were reared on castor bean leaves at 27 ± 2°C and 65 ± 5% R.H. and photoperiod of 16:8 hr (L:D) as described by El-Dafrawiet *et al.* 1964.

Commercial essential oils:-

Lavender oil and mint oil (containing carvone, menthol, menthone, sinod, kadenin and limonene as major constituents) were obtained from El Captain Company, Cairo, Egypt.

Preparations of aqueous botanical extracts:-

Healthy plants *Catharanthus roseus* (family: Apocynaceae) and *Artemesia herba-alba* (family: Asteraceae) were collected in the morning hours from the medicinal plant garden, Faculty of Pharmacy, Cairo university and after separating the leaves to test their insecticidal properties against *S. littoralis*, they were washed with distilled water and left to dry in the shade. Finally, they were transferred to an oven (70°C) for 24 hour and the dried leaves were blendered to make fine powder. Fifty gram of dried powder were stirred with 1 Liter distilled water for 1 hour and incubated for 48 hour at 4°C and then stirred for additional 1 h and filtered twice through whatman No.1 filter paper. The volume was made up to 500 ml and it was considered as stock solution of the extract. This stock extract was maintained in a refrigerator until being used and the diluted concentration of the extract were made up.

Insect Bioassay:-

Leaf-dip method as described by **Tabashnik et al. 1991** was followed using castor leaves. Fresh castor leaves, of almost the same size, were dipped in different concentrations (0.1, 0.5, 0.75, 1, 1.5 and 2%) in case of treatment each of *S. littoralis* 2nd and 4th instars with essential oils but dipped in (1, 5, 10, 15, 20 and 25%) concentrations for botanical extracts treatments. The dipping lasted for ca. 5-10 seconds and left to dry in air from excess solution. The treated leaves were transferred singly in plastic cups where 10 individuals of 2nd and 4th instar larvae were allowed to feed on these treated leaves. Treated leaves were offered to larvae for 48 hrs. Three replicates of each concentration were performed. The untreated castor bean leaves (control) were dipped in distilled water for the same period of time as treated ones. Insect mortality were recorded daily starting after 24h from treatment. The experiment was conducted at laboratory temperature of 27 ± 2 °C, $70 \pm 5\%$ R.H. with photoperiod of 16:8 (L: D) hr.

The mortality % was corrected according to Abbott's formula (**Abbott, 1925**) as follows:

$$\text{Corrected mortality \%} = \frac{\text{Observed mortality \%} - \text{control mortality \%}}{100 - \text{control mortality \%}} \times 100$$

Probit analysis was determined to calculate the median lethal concentration values (LC₅₀) and related parameters, according to **Finney (1971)**.

Feeding deterrent activity (non-choice method):-

Feeding deterrent activity of the botanical solutions was assayed against *S. littoralis* 2nd and 4th instar larvae using a leaf-dip bioassay in no-choice situations. For this purpose the concentrations (LC₂₅ and LC₅₀) of essential oils and botanical extracts were prepared for each instar. The Leaf discs of (Ø= 8 cm) were impregnated for 5-10 seconds in each concentrations and the control leaf discs were impregnated in distilled water for the same time. In each plastic Petri dish (1.5 cm x 9 cm) wet filter paper was placed to avoid early drying of the leaf discs and ten larvae per replicate of either 2nd or 4th instar were introduced. Progressive consumption of leaf weight by the larvae after 24 hrs was recorded in control and treated discs. Amount of leaf eaten by the larva in essential oils and botanical extracts treatments was corrected from control. Three replicates were maintained for each treatment with 10 larvae per replicate (total, n= 30). Feeding deterrent activity was assessed by calculating the Feeding Deterrence Index by the formula of **Saleh et al. 1986**:

Feeding Deterrence Index (FDI);

$$= \left(1 - \frac{\text{Percentage of treated consumed leaf}}{\text{Percentage of untreated consumed leaf}} \right) \times 100$$

Statistical Analyses:-

Using the computed percentage of mortalities versus corresponding concentrations, Probit analysis was adopted according to **Finney (1971)** using a software computer program (**SAS, 2002**). This yields determination of the toxicity indices (LC₂₅ and LC₅₀) as well as the related parameters (95% confidence intervals, slope and Chi-square, χ^2) for established toxicity regression lines.

Obtained data were statistically analyzed using one-way analysis of variance (**ANOVA**) supported by Duncan's multiple range test (**Duncan, 1955**) running on **Costat statistical software, 1990**. Means were compared using L.S.D. (5% significance level).

Results and Discussion:-

Toxicity of tested botanicals to *S. littoralis*:-

Table (1 & 2) revealed that the LC₂₅ and LC₅₀ values were 0.179 and 0.379 %, respectively for lavender compared with 0.296 and 0.417 %, respectively for mint against 2nd instar larvae. The LC₂₅ and LC₅₀ values were 0.293 and 0.504 %, respectively for lavender compared with 0.39 and 0.839 %, respectively for mint against 4th instar larvae. The essential oils act at multiple levels in the insects, so the possibility of generating resistance is little probable (Gutierrez *et al.* 2009). The main components of lavender oil were linalool acetate and linalool while the mint oil consisted of menthol in high percentage, menthone (*iso*), β -pinene, and menthyl acetate (Karamaouna *et al.* 2013).

In addition, the LC₂₅ and LC₅₀ values were 2.297 and 5.016 %, respectively for *Catharanthus* compared with 2.633 and 6.527 %, respectively for *Artemisia* extract against 2nd instar larvae. While the LC₂₅ and LC₅₀ values were 3.456 and 6.56 %, respectively for *Catharanthus* compared with 3.818 and 8.332 %, respectively for *Artemisia* against 4th instar larvae. The slope values indicated that the insect population was relatively heterogeneous in their susceptibility toward tested essential oils and botanical extracts by leaf-dip method. Our results showed LC₅₀ values, the range of toxicity was in the decreasing order of lavender > mint > *Catharanthus* > *Artemisia* against both *S. littoralis* 2nd and 4th instars.

The *Artemisia* sp. belonging to the important family Asteraceae (Compositae) has known to possess several important biological properties, such as insecticidal activity (Saleh 1984). Hifnawy *et al.* (2001) reported larvicidal activity of *A. herba-alba* against cotton leafworm, *S. littoralis* (Biosd.) larvae.

Among the plants found to contain insecticidal or growth regulatory effects of insects, plants from the genus *Ageratum* and *Artemisia* were reported to have insecticidal activity (Anjoo and Ajay 2008). *Artemisia herba-alba*, is rich in terpenoids like monoterpene hydrocarbons (Behtari *et al.* 2012), oxygenated monoterpenes (Hudaib and Aburjai 2006) and sesquiterpenes (Laid *et al.* 2008 and Paolini *et al.* 2010). Ramya *et al.* (2008) and Alaguchamy and Jayakumararaj (2015) studied the effect of leaf aqueous extract of *C. roseus* and they recommended that it can potentially be used as ecofriendly bio-pesticide to control the devastating damage caused by larvae of *Helicoverpa armigera*.

Kumar and Yadav (2013) showed that screened phytochemical constituents of *Catharanthus roseus* (family: Apocynaceae) possesses carbohydrates, anthraquinone glycosides, flavanoids, saponins, and alkaloids. Also, the work on the isolation of a possible insect growth regulator (IGR) from *C. roseus* is in progress (Summarwar and Pandey 2015).

Table (1): Toxicity indices (LC₂₅ and LC₅₀) of the essential oils (Mint and Lavender) and the botanical extracts (*Artemisia herba-alba* and *Catharanthus roseus*) against *Spodoptera littoralis* 2nd instar larvae.

Phytochemicals	LC ₂₅ (Conc. %) 95% confidence interval	LC ₅₀ (Conc. %) 95% confidence interval	Slope \pm SE	χ^2
Mint	0.296 (0.12 - 0.52)	0.417 (0.34 - 0.67)	2.44 \pm 0.31	4.17
Lavender	0.179 (0.12 - 0.37)	0.379 (0.26 - 0.77)	2.41 \pm 0.35	2.13
<i>Artemisia</i>	2.633 (1.96 - 3.27)	6.527 (4.81 - 7.96)	1.71 \pm 0.24	4.83
<i>Catharanthus</i>	2.297 (1.11 - 3.27)	5.016 (4.81 - 7.96)	1.98 \pm 0.26	3.42

* LC₂₅ and LC₅₀ values are significant (p < 0.05) whenever confidence intervals do not overlap.

Table (2): Toxicity indices (LC₂₅ and LC₅₀) of the essential oils (Mint and Lavender) and the botanical extracts (*Artemisia herba-alba* and *Catharanthus roseus*) against *Spodoptera littoralis* 4th instar larvae.

Phytochemicals	LC ₂₅ (Conc. %) 95% confidence interval	LC ₅₀ (Conc. %) 95% confidence interval	Slope \pm SE	χ^2
Mint	0.390 (0.13 - 0.49)	0.839 (0.53 - 0.99)	2.96 \pm 0.30	3.42
Lavender	0.293 (0.19 - 0.58)	0.504 (0.33 - 0.78)	3.02 \pm 0.35	3.67
<i>Artemisia</i>	3.818 (1.75 - 6.29)	8.332 (6.00 - 11.17)	1.12 \pm 0.24	1.52
<i>Catharanthus</i>	3.456 (1.97 - 5.78)	6.56 (4.40 - 7.71)	1.15 \pm 0.23	3.41

* LC₂₅ and LC₅₀ values are significant (p < 0.05) whenever confidence intervals do not overlap.

Feeding deterrence activity:-

Data presented in table (3) showed that the mean feeding deterrence activity (based on feeding deterrence index values) was significantly different (P < 0.05) between lavender and mint oil treatments on 2nd instar larvae at both

LC₂₅ and LC₅₀ where mean feeding deterrent values at LC₂₅ were higher in case of mint oil (68.369 %) than that in case of lavender oil (65.833 %) for four days after treatment. while for the same instar at LC₅₀ levels, the mean feeding deterrent values were higher in case of lavender oil (79.151 %) compared to that in case of mint oil (75.272%). In connection with the 4th instar, also the mean feeding deterrent values were significantly different between lavender and mint oil treatments either at LC₂₅ or LC₅₀ where mean feeding deterrent values at LC₂₅ were higher in case of mint oil (63.561%) than that in case of lavender oil (60.408 %) for four days after treatment. Also, at LC₅₀ levels, the mean feeding deterrent values were still higher in case of mint oil (73.413 %) compared to lavender oil (70.837%) (table 3).

Depending on the data, the mint oil exhibited relatively more feeding deterrent effect than lavender oil treatments. The higher feeding deterrence index normally indicates decreased rate of feeding. Also, the *Mentha pulegium* oil significantly inhibits the feeding of fall armyworm, *Spodoptera frugiperda* (Zalkowet *et al.* 1979). Any substance that reduces food consumption by an insect can be considered as antifeedant or feeding deterrent (Isman 2002).

Abd El-Galeil and Nakatani (2003) indicated that the antifeedant activity was dose-dependent in some of the isolated compounds. Elumalai *et al.* (2010) reported that all tested essential oils are showed moderate antifeedant activity against 4th instar larvae of *S. litura*; however, the highest antifeedant activity was observed in the essential oils of *Cuminum cyminu*, *Mentha pipertia*, *Rosmarinus officinalis*, *Thymus vulgaris*. *Coriandrum sativum* exhibited (100%) complete antifeedant activity at 6 mg/cm².

Table (3): Percentage feeding deterrent indices (mean \pm SE) of *S. littoralis* 2nd and 4th instars larvae treated with LC₂₅ and LC₅₀ of essential oils (Mint and Lavender).

Treatment	LC ₂₅		LC ₅₀	
	2 nd instar	4 th instar	2 nd instar	4 th instar
Mint	68.369 \pm 4.195 ^a	63.561 \pm 3.895 ^a	75.272 \pm 4.613 ^b	73.413 \pm 4.504 ^a
Lavender	65.833 \pm 4.116 ^b	60.408 \pm 3.706 ^b	79.151 \pm 4.850 ^a	70.837 \pm 4.342 ^b
L.S.D.5%	2.173	2.199	2.217	2.249

*Within the same column, means followed by the same letter are not significantly different (P > 0.05).

While table (4) showed that the mean feeding deterrent activity (based on antifeedant index values) was significantly different (P < 0.05) between *Artemisia* and *Catharanthus* treatments on 2nd instar larvae at both LC₂₅ and LC₅₀ where mean antifeedant values at LC₂₅ were higher in case of *Catharanthus* (63.503 %) than that in case of *Artemisia* (56.46 %) for four days after treatment. Also, for the same instar at LC₅₀ levels, the mean antifeedant values were still higher in case of *Catharanthus* (70.903 %) compared to *Artemisia* (63.617 %).

In connection with the 4th instar, also the mean feeding deterrence values were significant different between *Catharanthus* and *Artemisia* treatments either at LC₂₅ or LC₅₀ where mean antifeedant values at LC₂₅ were higher in case of *Catharanthus* (57.65%) than that in case of *Artemisia* (54.342%) for four days after treatment. Also, at LC₅₀ levels, the mean feeding deterrent values were still higher in case of *Catharanthus* (67.75 %) compared to *Artemisia* (63.871 %) (table 4).

It is obvious from data that the *Catharanthus* extract exhibited more feeding deterrent effect than *Artemisia* extract. In addition, the data indicates that feeding deterrence of both botanical extracts has increasing trend till the 4th day after treatments. Also, it is interesting to notice that the feeding deterrent activity of both botanical extracts was higher in 2nd instar than 4th instar larvae.

The extracts of *Artemisia monosperma*, *Calotropia procera* and *Tagetes patula* were the powerful antifeeding effect against *S. littoralis* larvae (Ahmed 1985). In general, the antifeeding effect of plant extracts depend mainly on insect species, however, the plant structure-activity relationship associated with its components on insect feeding is complex and no clear trends emerge (Bruno *et al.* 2002).

Erturk (2006) reported that the extracts derived from different plants *Artemisia absinthum*, *Aesculus hippocastanum*, *Viscum album*, *Sambucus nigra*, *Buxus sempervirens*, *Diospyros kaki*, *Alnus glutinosagoertn*, *Origanum vulgare*, *Hypericum androsaemum* and *Ocimum basilicum* had antifeeding effect against the 3rd – 4th instar larvae of the *Thaumetopoea solitaria* (Lepidoptera).

While **Summarwar and Pandey (2015)** observed that at 5% of leaf extract of *C. roseus* the percent feeding of *S. litura* 4th instar larvae was reduced to 47.77 compared to 82.47 % in control. Also, the antifeedant activity caused a reduction in food consumption and chronic toxicity leading to delayed growth, development and increased mortality (**Vattikonda et al. 2015**).

Table (4): Percentage feeding deterrent indices (mean \pm SE) of *S. littoralis* 2nd and 4th instars larvae treated with LC₂₅ and LC₅₀ of botanical extracts (*Artemisia herba-alba* and *Catharanthus roseus*).

Treatment	LC ₂₅		LC ₅₀	
	2 nd instar	4 th instar	2 nd instar	4 th instar
<i>Artemisia</i>	56.460 \pm 3.462 ^b	54.342 \pm 3.332 ^b	63.617 \pm 3.902 ^b	63.871 \pm 3.920 ^b
<i>Catharanthus</i>	63.503 \pm 3.896 ^a	57.650 \pm 3.535 ^a	70.903 \pm 4.349 ^a	67.750 \pm 4.157 ^a
L.S.D.5%	2.203	2.162	2.203	2.361

*Within the same column, means followed by the same letter are not significantly different (P > 0.05).

Conclusion:-

Our results confirmed that the tested botanicals either oils or extracts resulted in increased mortality, reduced food consumption via their feeding deterrent effect and exert a adverse impact on *S. littoralis* growth and development. These effects were dose-dependent. The findings may be helpful and effective for studying the efficacy of such botanicals as a part of the Integrated Pest Management (IPM) against this pest and closely related ones.

Abstract

Enterococcal infection is a life threatening systemic infection prevalent in developing countries like India and is a major public health problem. Enterococci are important nosocomial pathogen of human disease; second most common cause of nosocomial urinary tract and wound infections; third most common cause of nosocomial bacteremias. Because of their resistance to different antimicrobial agents these bacteria are often involved in serious super-infections among patients receiving broad-spectrum anti-microbial therapy. Correct diagnosis is crucial in proper management of Enterococcal infection, so laboratory tests are essential to establish identification of Enterococcal species. The study was conducted to isolate and characterize *Enterococcus* species from different clinical samples and to perform antimicrobial susceptibility testing in all age groups and both genders. Out of 200 Enterococcal species isolated, 164 (82%) were *E. faecalis* and 34 (17%) were *E. faecium*; majority were isolated from urine (60%) and blood (35.5%); they showed more resistance to penicillin (92%), less resistance to vancomycin (1%) and no resistance to linezolid (0%).

Introduction:-

Enterococci are Gram-positive cocci which are normal residents of the gastrointestinal tract, biliary tract and, in lower numbers, of the vagina and male urethra, in saliva. They are becoming increasingly important nosocomial pathogen of human disease, largely because of their resistance to antimicrobial agents to which other streptococci are generally susceptible.

Enterococci are the second most common cause of nosocomial urinary tract and wound infections and the third most common cause of nosocomial bacteremias. *Enterococcus* species also cause endocarditis, intraabdominal and pelvic infections, soft-tissue infections, neonatal sepsis and rarely meningitis¹.

Because of their resistance to penicillin and cephalosporin group, the acquisition of high-level resistance to aminoglycosides, and now the emergence of vancomycin resistance, these bacteria are often involved in serious super-infections among patients receiving broad-spectrum anti-microbial chemotherapy. Newer agents such as linezolid and daptomycin may also be effective; other agents such as chloramphenicol may be used when multidrug-resistant strains are encountered. For urinary tract isolates, nitrofurantoin, tetracycline, or quinolone may be effective^{1,2}.

In mid-1980s, *Enterococci* were distinguished from *streptococci* and related taxa by their ability to grow at 10°C and 45°C, growth in the presence of 6.5% NaCl, growth at pH 9.6, grow in 0.1% methylene blue milk, ability to hydrolyze esculin in the presence of 40% bile, and production of pyrrolidonyl arylamidase (PYR)^{1,3}.

Enterococcus faecalis is the most common isolate found in human clinical specimens, followed by *Enterococcus faecium*. Other Enterococcal species, including *E. avium*, *E. cassiliflavus*, *E. cecorum*, *E. durans*, *E. gallinarum*, *E. hirae*, *E. raffinosus*, *E. malodoratus*, *E. dispar* and *E. mundtii* are infrequently isolated from human infections.

Risk factors for the development of bacteremias include advanced age, immunosuppression, underlying disease and conditions (e.g.; prematurity, diabetes, malignancy, congestive heart failure, renal insufficiency, deep-seated infections), prior gastrointestinal, genitourinary, or respiratory tract instrumentation, long-term hospitalization, and the use of broad-spectrum antibiotics having little or no antienterococcal activity (e.g., cephalosporin)¹.

Isolation measures to prevent person-to-person transmission according to CDC's Guidelines includes⁴:

- Hand washing with antimicrobial soaps and hand rubs with alcohol-based solutions,
- Wear gloves, Wear a gown,
- Dedicate the use of items such as stethoscopes, blood pressure cuffs, and thermometers to a single patient.

Aims and Objectives:-

- ▶ To isolate Enterococci from different clinical samples and to speciate Enterococci by different tests.
- ▶ To determine antibiotic susceptibility pattern of *Enterococcus* species for proper treatment of patient by specific antimicrobial drugs.

Materials and Methods:-

The study was conducted from May 2014 to August 2015 in Sir Takhtsinhji General Hospital, Bhavnagar, Gujarat, India.

In this study 200 Enterococci species isolated from different clinical samples- Urine, blood culture, pus, catheter tips and body fluids collected in sterile container from all patients attending to Hospital. Samples were collected from patients having risk factors like advanced age, immunosuppression, prematurity, diabetes, malignancy, congestive heart failure, renal insufficiency, deep-seated infections, prior gastrointestinal, genitourinary, or respiratory tract instrumentation, long-term hospitalization, and long- term use of broad-spectrum antibiotics.

Identification and Characterization:-

Urine samples were inoculated on CLED agar, other mentioned samples were inoculated on Blood agar. After overnight incubation at 37°C colonies were identified. Further identification was done by inoculation on Bile-Esculin agar, PT agar, by doing Gram stain, Catalase test, Growth in 6.5% NaCl and Carbohydrate Fermentation Test using six sugars- Mannitol, Sorbitol, Sucrose, Raffinose, Lactose, Arabinose.

Antimicrobial Susceptibility Testing:-

Antibiotic susceptibility testing of the isolates was performed on Muller Hinton agar by Kirby-Bauer disc diffusion method⁵. The antibiotic concentration of disc used and zone size interpretation was accordance to Clinical Laboratory Standards Institute (CLSI)⁶. These antimicrobial drugs are Ampicillin, Ampicillin-Sulbactam, Penicillin, Piperacillin-Tazobactam, Linezolid, Ciprofloxacin, Tetracycline, Roxithromycin, Vancomycin, High level Gentamycin (120µg), High level Streptomycin (300µg), and Nitrofurantoin. Commercially available six mm disks (Himedia Laboratories, Mumbai) were used.

Quality Controls:-

Standard operative procedures were followed during processing of each sample. *E.faecalis* VRE ATCC 51299 and *E.faecalis* VSE ATCC 29212 were used as a reference strains^{7,8}.

Results:-

Out of 1850 culture positive samples proceeded, 200 Enterococci were isolated from urine, blood, pus, catheter tip (hospital acquired) & body fluid (peritoneal fluid), suggesting 11% prevalence rate of Enterococci.

Enterococci are Gram positive oval cocci, arranged in pairs at an angle to each other; catalase negative; can grow in 6.5% NaCl. After overnight incubation small yellow or pink colonies were formed on CLED medium; small, cream or white or grayish-white, smooth entire, non-hemolytic colonies were formed on Blood agar. As Enterococci hydrolases esculin in presence of 40% bile, blackening on BEA media seen. *E.faecalis* could grow on PT agar producing black colonies, but *E.faecium* could not^{1,3,9}.

Isolated Enterococci species distribution, sample wise, age and sex wise distribution of Enterococci species shown in Table - 1, 2, 3 and 4 respectively.

Table 1:- Species of Enterococci isolated

Enterococci Species	Number	Percentage
<i>E.faecalis</i>	164	82%
<i>E.faecium</i>	34	17%
Other	2	1%

Other Enterococcal species might be *E.avium*, *E.gallinarum*, *E.cassiliflavus*, *E.durans*, *E.raffinosis* or *E.mundtii*.

Table 2:-Samples showing Enterococcal species isolation

Samples	Number	Percentage
Urine	120	60%
Blood	71	35.5%
Pus	3	1.5%
Peritoneal fluid	2	1%
Catheter tip	4	2%

Table 3:- Age-wise distribution of Enterococci Species.

Age Group	Number	Percentage
<1 year	44	22%
1-15 year	32	16%
16-30 year	28	14%
31-45 year	40	20%
46-60 year	34	17%
>60 year	22	11%

Table 4:- Sex-wise distribution of Enterococci Species.

Sex	Number	Percentage
Female	113	56.50%
Male	87	43.50%

The antimicrobial susceptibility pattern of Enterococci species has been shown in Table-5. In spite of predominance of *E.faecalis*, it was observed that *E.faecium* was more resistant than *E.faecalis*.

Table 5:-Antimicrobial drug resistance in Enterococci.

Antimicrobial Drugs	Isolates Resistant to Antimicrobial Drugs (200 species)	Percentage of Resistance
Ampicillin	106	53%
Ampicillin-Sulbactam	83	41.5%
Penicillin	184	92%
Piperacillin-Tazobactam	108	54%
Linezolid	0	0%
Ciprofloxacin	115	57.50%
Tetracycline	136	68%
Roxithromycin	125	62.50%
Vancomycin	2	1%

Discussion:-

Enterococci colonize the bowels of more than 90% of healthy humans. *E. faecalis* accounts for more than 80% of the Enterococcal isolates in clinical samples, but in recent years *E. faecium* has become more common, probably because of its greater antibiotic resistance to multiple antibiotics. For the last two decades, *Enterococcus* have been the 3rd most common cause of hospital-acquired infections (HAI) after *E.coli* and *Staphylococcus aureus* and ahead of *Pseudomonas aeruginosa*. The most common nosocomial infections caused by Enterococci are urinary tract infections (associated with instrumentation and antimicrobial administration) followed by intra-abdominal and pelvic infections. They also cause endocarditis, neonatal sepsis and rarely meningitis.

In last two decades infections due to Enterococci have increased. Now, it is among the leading causes of bacteremias. Enterococci is the second most common cause of surgical infections and the third most frequently reported cause of HAIs. Gastrointestinal colonization, length of stay in hospital, ICU stay, older age, neutropenia, hematological malignancies and transplantation are risk factors identified for Enterococcal colonization and infection¹¹.

The emergence of high-level resistance to aminoglycosides in Enterococci, particularly *E.faecalis* and *E.faecium*, seriously affected the therapeutic approach; vancomycin become a first-line drug effective against Enterococci¹².

Until the early 1980s, the susceptibility of Enterococci to ampicillin and vancomycin remained fairly predictable. Since that time, *Enterococcus* species resistant to Ampicillin and vancomycin have been reported with increasing frequency. Linezolid seemed to be an appropriate therapeutic option for VRE in our study¹³.

In present study isolated *E.faecalis* and *E.faecium* were 82% and 17%, which is comparable to studies conducted by Bose et al¹⁴ (82% and 18%) and Gupta et al¹⁵ (80% and 20%); In present study only two other species (1%) isolated which might be *E. durans*, *E. raffinosus*, *E. avium*, *E. gallinarum* comparable to study done by Grey et al¹⁶ (1.2%).

In present study, the most common clinical sample from which Enterococci were isolated was urine (60%), comparable to studies conducted by Agrawal et al¹⁷ (62.79%) and Bhatt et al¹⁸ (57%); followed by blood (35.50%), pus (1.50%), catheter tips (2%), peritoneal fluid (1%).

Present study showed that isolation of Enterococci from all age groups, ranging from newborn baby to an old age of 86 years and highest percentage (22%) of Enterococcal isolates was obtained from <1 year age group, similar to observed by Nepal et al¹⁹ (20%).

In present study female predominance (56.5%) over males seen corresponds to the Bhatt et al¹⁸ (54%). Greater vulnerability to acquire urinary tract infection and pelvic infection due to anatomic position of urethra and genital tract might have played a role for predominant female infection by this organism^{11,18}.

In present study, beta-lactam drugs, flouroquinolones, high level aminoglycosides and tetracycline were found to be highly resistant; penicillin was most resistant (92%), comparable to study done by Bhatt et al¹⁸ (97.5%). In present study linezolid has shown 0% resistance, followed by vancomycin shown 1% resistance, comparable to studies conducted by Bose et al¹⁴ (linezolid 0% resistant) and Saraswathy et al²⁰ (vancomycin 1% resistant).

Conclusion:-

- In developing country like INDIA Enterococci are important nosocomial pathogens of human disease; because of their resistance to antimicrobial agents like penicillins, cephalosporins group, the acquisition of high-level resistance to aminoglycosides and now the emergence of vancomycin resistance, these bacteria are often involved in serious super-infections among patients receiving broad-spectrum anti-microbial chemotherapy. Prompt diagnosis is essential for the patient and the community.
- Identification of Enterococci done by urine culture, blood culture, Gram stain and also by other methods like catalase test negative, its ability to grow at 10°C and 45°C, growth in the presence of 6.5% NaCl, ability to hydrolyze esculin in the presence of 40% bile and sugar fermentation test.
- Mainly two species of Enterococci were isolated, *E. faecalis* (82%) & *E. faecium* (17%).
- Out of 200 Enterococcal species 60% were isolated from urine samples, followed by 35.5% were from blood samples.
- As far as antibiotic susceptibility was concerned, resistance to penicillin (92%), suggest that resistance to β -lactam group was more among *Enterococcus* species. Resistance to vancomycin shown in 1% Enterococcal species, linezolid is more effective drug as all isolates are sensitive to it.

Abstract

In order to obtain new chloro(aminopyrazoly)ketone compounds with good herbicidal activity, a series of 5-Chloro-3-methyl-1-phenyl-1H pyrazole-4-carbohydrazide derivatives were designed and synthesized using a series of relational synthons. Their structures were determined by IR, ¹H NMR, and elemental analyses. These compounds were screened for Herbicidal activities against Barnyard grass and Rape seed.

Introduction:-

Pyrazole type herbicidal are those compounds which having a low phytotoxicity, exhibiting excellent herbicidal activity at lower dosages than known analogous herbicidal. As reported, many 4-carbonyl pyrazole derivatives classified as the inhibitors of 4-hydroxyphenyl-pyruvate dioxygenase (4-HPPD) displayed excellent herbicidal activities, such as pyrazolynate 1, pyrazoxyfen 2 and benzofenap 3 (Figure 1). 4-HPPD inhibitor are a class of herbicides that prevent plants by blocking 4-Hydroxyphenyl pyruvate dioxygenase, an enzyme in plants that breaks down the amino acid, tyrosine into components that are used by plants to create other molecules that plants need. This process of breakdown, or catabolism, and making new molecules from the results, or biosynthesis, is something all living things do¹.

HPPD inhibitors were first brought to market in 1980, although their mechanism of action was not understood until the late 1990s. They were originally used primarily in Japan in rice production, but since the late 1990s have been used in Europe and North America for corn, soybeans, and cereals, and since the 2000s have become more important as weeds have become resistant to glyphosate and other herbicides. Among these Benzofenap is a Pyrazole herbicide first synthesized in 1981 by Mitsubishi Petrochemical Company². It is a translocated, selective, root and shoots absorbed herbicide used mainly for broad-leaved water weed control in Rice. Pyrazolynate, an herbicide belonging to the group unclassified is used for controlling weeds. Several Pyrazolynate also has a high activity on rice weeds³. Pyrazoxyfen is a benzoyl pyrazole herbicides, it is used pre or post emergence after transplanting in paddy rice to control annul and perennial weeds⁴. It can be used to direct seeded rice.

By comparisons with other 4-hydroxyphenol-pyruvate dioxygenase (4-HPPD) inhibitors, it was concluded that their main pharmacophore was 5-hydroxyl-4-benzoyl pyrazole. It was also noticed that amino group possessed a similar capability of forming complex compounds with hydroxyl group, and according to the bioisosterism theory, both pyrazole ring and benzene ring were ring equivalents. Also it had chloro group at 5th position in main pyrazole moiety. However, the pyrazole derivatives containing two pyrazole rings used as herbicide have been rarely reported. In order to find valuable lead compounds with high herbicidal activity, a series of the title compounds 6-7 (Figure 1) were designed and synthesized.

Schemes 1.

Schemes 2.

Scheme 3.

Scheme 4.

Material and Method:-

Synthesis:-

5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbohydrazide was prepared as per the procedure described in our research paper⁵

The title compounds were synthesized according to Scheme 1-4 by in a parallel synthesis fashion, by which a number of 5-Amino compounds with various substitutions and 5-Hydroxyl compound are produced. In First, ethyl 2-cyano-3-ethoxyacrylates were reacted with 5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbohydrazide [5] to obtained Ethyl-5-amino-1-(5-chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbonyl)-1*H*-pyrazole-4-carboxylate[6A], then [6A] was transformed to its hydrazine derivatives [6B].

In second scheme, ethyl cyanoacetate reacted with 1,1,1 triethoxy ethane to obtained Ethyl (E)-2-cyano-3-ethoxybut-2-enoate. This is reacted with 5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbohydrazide [5] to obtain Ethyl-5-amino-1-(5-chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbonyl)-3-methyl-1*H*-pyrazole-4-carboxylate [7A]. Then [7A] was transformed to its hydrazine derivatives [7B].

In third scheme 2-(1-ethoxyethylidene)malononitrile was reacted with 5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbohydrazide [5] to obtained 5-Amino-1-(5-chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbonyl)-3-methyl-1*H*-pyrazole-4-carbonitrile [6C].

In forth scheme Ethyl acetoacetate was reacted with 5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbohydrazide [5] to obtained (5-Chloro-3-methyl-1-phenyl-1*H*-pyrazol-4-yl)(5-hydroxy-3,4-dimethyl-1*H*-pyrazol-1-yl) methanone [6D]. All compounds are characterized by ¹H NMR and FTIR analysis.

Herbicidal activity:-

These compounds were screened for herbicidal activities against rape and Barnyard grass (Table 1). The results showed that, when R₂ was 4-carbohydrazide group [6B & 7B], compounds always possessed better herbicidal activities against barnyard grass rather than ester, cyano and hydroxyl group at 100µg/mL; All the synthesized compounds showing non-inhibitory activity against Rape root.

Table 1:- Structure and herbicidal activity of targeted compounds.

Sample No.	Comp.	R ₁	R ₂	R ₃	MP (°C)	Yield %	Rape root Test (cm) 100 µg/mL	Barnyard grass cup test (cm) 100 µg/mL

Figure 2:- Herbicidal Activity of compounds containing carbohydrazide group at 4th position [6B & 7B] on Rape seed & Barnyard grass.

Experimental:-

General Methods:-

Melting points were determined in open capillary on an electrically heated block are uncorrected. IR (KBr) spectra were recorded on Perkin Elmer FTIR and only noteworthy absorption levels (cm^{-1}) are listed. PMR spectra on Varian 300 MHz and AMX-400 Bruker spectrophotometer using TMS as an internal standard and chemical shifts measured in δ (ppm). The required 3-Methyl-1-phenyl-2-pyrazolin-5-one was prepared according to Vogel's procedure⁶. Diazomethane required for the methylation of acid was prepared according to Organic synthesis method⁷.

5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbaldehyde [2] was prepared under Vilsmeier conditions^{8,9} from 3-Methyl-1-phenyl-2-pyrazolin-5-one [1] in which chlorination of C-5 occurs in addition to the expected formylation. This 4-carboxaldehyde is then oxidized with Potassium permanganate¹⁰ to give 5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carboxylic Acid [3]. This acid is then methylated by diazomethane in dry ether to give 5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carboxylic acid methyl ester [4]. The methyl ester is then treated with hydrazine hydrate to give 5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-hydrazide [5].

TLC was used to assess the reactions and the purity of the synthesized compounds. All the compounds gave satisfactory elemental analysis.

3-Methyl-1-phenyl-2-pyrazolin-5-one [1]:-

50 gm (49 mL, 0.384 mole) of redistilled ethyl acetoacetate and 40 gm (36.5 mL, 0.37 mole) of phenyl hydrazine were mixed together in a large evaporating dish. The mixture was heated on a boiling water bath in the fume cupboard for about 2 hours and stirred from time to time with glass rod. The heavy reddish syrup was allowed to cool somewhat, about 100 mL of ether was added to it and the mixture was stirred vigorously. The syrup, which was insoluble in ether, solidified within 15 minutes. The solid was filtered at the pump and washed thoroughly with ether to remove colored impurities. It was recrystallized from hot water to give 3-methyl-1-phenyl-2-pyrazolin-5-one.

Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbaldehyde [2]:-

For the preparation of 5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbaldehyde, POCl_3 (0.35 mole, 32.0 mL) was added to ice-cold dimethyl formamide (0.16 mole, 12.0 mL). To this mixture 3-Methyl-1-phenyl-2-pyrazolin-5-one [1] (0.05 mole, 8.1 gm) was added and the mixture was heated under reflux for 1.0 hrs. After cooling the reaction mixture was poured into ice-cold water (300 mL). The solid precipitated was collected by filtration, washed with cold water, dried and recrystallized from ethanol to give pale yellow crystal of 5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbaldehyde. Yield (90 %), mp: 145-148 °C.

Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carboxylic Acid [3]:-

In three 500 mL flask, 5-Chloro-3-methyl-1-phenyl-1*H*-pyrazole-4-carbaldehyde [2] 0.05 mol and 100 mL of water was slowly added dropwise 0.075 mol KMnO_4 in 200 mL aqueous oxidation. Dropping was completed, the

temperature was raised to 70 -80 ° C reactor 8 h. Adjusting the pH of the reaction solution was made alkaline with 10% Barium Hydroxide solution was slowly cooled, insoluble's were removed by filtration, and the filtrate was acidified with concentrated hydrochloric acid, the precipitated white solid was suction filtered, washing and drying, a white solid; Yield: Yield- (70.0 %) mp: 230 °C.

Chloro-3-methyl-1-phenyl-1H-pyrazole-4-carboxylic Acid Methyl ester [4]:-

2.365 gm (0.01 mole) of 5-Chloro-3-methyl-1-phenyl-1 H-pyrazole-4-carboxylic acid [3] was dissolved in 25 mL of ether. The solution was cooled to 0°C, with proper precaution excess diazomethane solution was added. As the reaction continued nitrogen generated in the reaction solution bubbled out. The reaction mass was kept in refrigerator overnight. Excess diazomethane was distilled out. The solid precipitate of 5-Chloro-3-methyl-1-phenyl-1 H-pyrazole-4-carboxylic acid methyl ester was recrystallized in ethanol. Yield- 75 % mp: 68 °C.

Chloro-3-methyl-1-phenyl-1 H-pyrazole-4-carboxylic acid hydrazide [5]:-

2.0 gm of 5-Chloro-3-methyl-1-phenyl-1 H-pyrazole-4-carboxylic acid methyl ester [4] was kept overnight under reflux in 10.0 mL of hydrazine hydrate. 25.0 mL of chloroform was added to the reaction mass and the hydrazine hydrate layer was separated. The chloroform layer was washed three times with water. The chloroform layer was dried on anhydrous sodium sulfate. The chloroform was evaporated to get solid precipitate of 5-Chloro-3-methyl-1-phenyl-1 H-pyrazole-4-carboxylic acid hydrazide. It was recrystallized in ethanol. Yield- (60.0 %) mp: 172-175 °C.

General procedure for the synthesis of title compounds [6A, 7A & 6C]:-

To a solution of intermediate [5] (5.0 mmol) in 15mL DMF is added Cyano compound (5.5 mmol). The mixture is refluxed for 8 h and cooled to room temperature, then poured into 30 mL water. The precipitate is collected by filtration and a white solid is obtained. The solid is purified by Column Purification. Desired products [6 A, 7 A & 6C] are obtained.

Procedure for the synthesis of title compounds [6D]:-

To a solution of intermediate [5] (5.0 mmol) in 15mL Acetic Acid is added Ethyl acetoacetate (5.5 mmol). The mixture is refluxed for 10 h and cooled to room temperature, then poured into 30 mL water. The precipitate is collected by filtration and a white solid is obtained. The solid is purified by Column Purification. Desired product [6D] is obtained.

General Procedure for the Reaction of 5-Amino-1H-pyrazole-4-carbohydrazide [6B & 7B]:-

A suspension of pyrazole derivatives [6A or 7A] (0.05mol) in 14.7 mL 85% hydrazine hydrate is heated at 105° for 6 h. Then the solution is evaporated under vacuum and cooled to room temperature. The residue is filtrated; washed with 25 mL diethyl ether three times. White crystalline solids [6B or 7B] are obtained.

Ethyl-5-amino-1-(5-chloro-3-methyl-1-phenyl-1H-pyrazole-4-carbonyl)-1H-pyrazole-4-carboxylate [6A]:-

Herbicidal Activity Tests:-

Inhibition of the root-growth of rape (*Brassicacampestris* L):-

The compounds to be tested are made into emulsions to aid dissolution. Rape seeds are soaked in distilled water for 4 h before being placed on a filter paper in a 6-cm Petri plate, to which 2 ml of inhibitor solution had been added in advance. Usually, 15 seeds are used on each plate. The plate is placed in a dark room and allowed to germinate for 65 hat 28° (±1). The lengths of 10 rape roots selected from each plate are measured and the means are calculated. The percentage inhibition is calculated relative to controls using distilled water instead of the inhibitor solution.

Inhibition of the seedling growth of barnyard grass (*Echinochloacrus-galli* (L) Beauv):-

The compounds to be evaluated are made into emulsions to aid dissolution. Ten barnyard grass seeds are placed into a 50-ml cup covered with a layer of glass beads and a piece of filter paper at the bottom, to which 5 ml of inhibitor solution had been added in advance. The cup is placed in a bright room and the seeds allowed germinating for 65 h at 28° (±1). The height of the aboveground parts of the seedlings in each cup is measured and the means calculated. The percentage inhibition is calculated relative to controls using distilled water instead of the inhibitor solution. The results of herbicidal activity listed in Table 2.

Conclusion:-

In conclusion, a 5 number of Chloro(aminopyrazoly) ketone compounds and 1 number of Chloro(hydroxypyrazoly) ketone compound were synthesized and tested for herbicidal activity. However, only a few compounds exhibited moderate activity against rape or barnyard grass. In general, the results indicated that all the compounds possessed a certain extent inhibiting activities against the rape root growth and exhibited activities against barnyard grass, but their activities are not as good as the diketone herbicides.

Acknowledgement:-

The authors wish to thank, Mr. Sreekanth Yerra of Laxai Avanti Life Sciences Pvt.Ltd. Hyderabad, Dr.Omvir Singh of Izen Biosciences Hyderabad for NMR and IR spectra of synthesized compounds. We also thankful to Mrs. Monali Swar, (Quality Manager), TTCWMA, Navi-Mumbai for Herbicidal Activity testing of synthesized compounds.

Bandur sheep, home tract, body weight, body measurement.

Abstract

Data pertaining to the body weight and body measurements of Bandur Sheep were collected on 737 animals from March 2015 to October 2015 of different age groups reared by farmers in the home tract village Bandur and its surrounding villages of Malavalli Taluk in Mandya district of Karnataka. The least squares mean body weight, height at withers, body length, chest girth and paunch girth were recorded to be 27.46 ± 0.27 kg, 53.48 ± 0.26 , 61.64 ± 0.15 , 72.62 ± 0.20 and 74.99 ± 0.23 cm, respectively. All these traits were significantly affected by age and sex.

Introduction:-

Karnataka possesses well defined breeds of sheep such as Bandur, Decanni, Hassan, Bellary, Chitradurga, Yellaga and other local strain that are prevalent in certain parts of the state as adjunct to cropping pattern. Mandya sheep is the best mutton breed of sheep in India and is in great demand for upgrading of other native breeds for Mutton within the country and abroad (Arora and Acharaya, 1976, Rai *et al.*, 1988). Mandya sheep is also called Bandur sheep because this breed is known to have originated from Bandur Village of Mallavalli taluk in Mandya district of Karnataka. Bandur sheep is the best mutton breed of the country and is being slaughtered regularly at high rate for mutton production leading to depletion in its number and genetic erosion over time lag. Hence, this warrants conservation and proliferation of this breed. Data on production traits of Bandur sheep at the field condition is scanty. No systematic attempt has been made to study the production parameters of Bandur sheep under field conditions at farmer's flocks. In this context the present study was undertaken in Bandur sheep under field conditions with the objectives to quantify the performance traits such as body weights and body measurements and to study the effect of non-genetic factors on body weight and body measurements.

Materials and Methods:-

Data pertaining to the body weight and body measurements were recorded on 737 sheep reared by the farmers at different ages based on dentition. The above data was collected from March 2015 to October 2015 in the home tract area of Bandur sheep, Bandur village and its surrounding eighteen villages of Malavalli Taluk of Mandya district in Karnataka. The home tract of this breed is located at an altitude of 609.60m above the mean sea level between the latitude 12.33° and longitude 70.04° . The average rainfall of this area ranges from 518.9 mm to 897.4 mm over the last five years. The mean maximum daily temperature recorded was 35.2° during April and a minimum was 17.2° c in December. The farmer's flocks were grazed from 10.00 am to 6.00 pm on uncultivated waste land and other

harvested fields. No supplemental feed is given to sheep maintained by the farmers. Lambs were allowed to suckle and remain with their mothers up to three months of age and weaned thereafter. Breeding rams were maintained under stall feeding conditions. Selective breeding was practiced in a limited way followed by flock mating system. Breeding is carried out throughout the year.

The animals were weighed using sensitive dial type (Salter) weighing balance before allowing for grazing and watering. Body measurements were recorded nearest to centimeter. All the measurements were taken using measuring tape after making the animal to stand squarely on an even surface. The animal was secured by an attendant with its head held a little high in a normal position as suggested by Turner *et al.*, (1953) and measurements were taken. The whole operation was carried out by a single operator to minimize possible errors. The data on body weight and body measurements were classified into five age groups such as, milk teeth, two teeth, four teeth, six teeth and eight teeth groups. The pooled data again classified into two sex groups i.e. male and female.

The least squares mean and the standard error of various traits of growth were computed by adopting Harvey's least squares method of fitting constants using the mixed model least squares and maximum likelihood computer programme (Harvey, 1990). Data used in the present study comprised of unequal subclass frequencies, thus leading to non-orthogonality. To overcome non-orthogonality of data, the least square analysis of variance technique was adopted to detect the significant sources of non-genetic variation if any (Harvey, 1987). The following fixed model was used for analysis of body weight and body measurements,

$$Y_{ijk} = \mu + A_i + S_j + e_{ijk}$$

Where Y_{ijk} = the record of the k^{th} individual belonging to the i^{th} age group and j^{th} sex group.

μ = population mean

A_i = fixed effect of the i^{th} age group ($i = 1, 2, 3, 4, 5$)

S_j = Fixed effect of j^{th} sex group ($j = 1, 2$)

e_{ijk} = Random error associated with Y_{ijk} and assumed to be identically, independently and normally distributed with mean zero and the unit variance

Result and Discussion:-

The least squares mean along with their standard errors of body weight and body measurements at different ages and sex of Bandur sheep are presented in table 1. The overall least squares mean body weight of Bandur sheep was 27.46 ± 0.27 kg (table 1). The mean body weight at different ages revealed that a faster growth rate from milk teeth to six teeth and the growth rate declined thereafter. This observation tallied closely with the reports of Acharaya and Bhat (1984) in Gaddi, Nagaraja *et al.* (1996), Siddalinga Murthy (2001) and Vasundradevi (2013) in Bandur Sheep and Taye *et al.* (2010) in Washera Sheep. The effect of age on body weight was found to be significant. Significant difference in body weights due to age were also reported by Taneja *et al.* (1993) in Magra sheep and Swarnkar and Arora (1996) in Malpura sheep, Dayananda (1998) in Tumkur strain and Siddalinga Murthy (2001) in Bandur Sheep. The increase in body weight is being noticed with advancement of age might be due to physiological phenomena of growth.

The body weight recorded for males (34.66 ± 0.49 kg) was higher compared to the females (25.63 ± 0.24 kg) indicating sexual dimorphism with respect to growth. This observation confirms the reports of Singh and Mathur (1971) in Coimbatore breed, Nimbkar (1993) in Decanni breed, Taneja *et al.* (1993) in Magra breed, Taye *et al.* (2010) in Washera Sheep and Dayananda (1998) in Tumkur strain, Nayak *et al.* (2008) in Ganjam Sheep and Siddalinga Murthy (2001) in Bandur sheep. However, no significant difference in sex was reported by Singh and Singh (1974) in Bikaneri breed.

Body measurements:-

The least squares mean body measurements at different ages in Bandur sheep is shown in table.1.

Height at withers:-

The least squares mean of height at wither recorded 53.48 ± 0.24 cm (Fig.3, table. 1). The present result was closely related with the values reported by Mahajan and Bahra (1977) in Gaddi, Taneja *et al.* (1993) in Magra, Dayananda (1998) in Tumkur strain, Taye *et al.* (2010) in Washera Sheep and Siddalinga Murthy (2001) and Vasundradevi (2013) in Bandur sheep. The height at withers of milk teeth group sheep differed significantly from all other age groups. Age had a Significant differences in height at withers as reported by Mahajan and Bahra (1977) in Gaddi,

Taneja *et al.* (1993) in Magra, Dayananda (1998) in Tumkur stain and Siddalinga Murthy (2001) in Bandur sheep. In contrast, Basu Thakur and Negi (1967) in Rampur Bushair reported non-significant effect of age on height at wither. The variation in height at withers between age groups appears to be a normal physiological function. The height at withers recorded for males (56.96 ± 0.24 cm) was higher compared to that of females (52.51 ± 0.11 cm) and the difference was significant ($P \leq 0.01$). Similar observations were made by Nimbkar (1993) in Decanni, Taneja *et al.* (1993) in Magra, Dayananda (1998) in Tumkur strain, Nayak *et al.* (2008) in Ganjam Sheep, Taye *et al.* (2010) in Washera Sheep and Siddalinga Murthy (2001) and Vasundradevi (2013) in Bandur sheep.

Body length:-

The least squares mean of body length measured was 61.64 ± 0.15 cm (Fig.2, table 1). The present result was similar to the reports of Nagaraja *et al.* (1996) in the same breed. The present observation was lower than the values reported by Basu thakur *et al.* (1967) in Rampur Bushair and Kalra *et al.* (1987) in Nali breed. However, body length recorded in the present study was higher than the values reported by Taneja *et al.* (1993) in Magra and Dayananda (1998) in Tumkur strain. Body length in milk teeth and two teeth age groups had significantly lower than all other age groups. The effect of age on body length was significant ($P \leq 0.01$). Significant differences in body length due to age were also reported by Taneja *et al.* (1993) in Magra, Dayananda (1998) in Tumkur strain and Taye *et al.* (2010) in Washera Sheep. The mean body length recorded for males was more (63.70 ± 0.27 cm) compared to females (59.54 ± 0.13 cm) and the difference was found to be significant. Similar reports were also made by Taneja *et al.* (1993) in Magra, Nayak *et al.* (2008) in Ganjam Sheep, Taye *et al.* (2010) in Washera Sheep and Siddalinga Murthy (2001) and Vasundradevi (2013) in Bandur Sheep. In contrast, Sharma *et al.* (1977) in Muzaffarnagari breed reported no significant effect of sex on body length.

Chest girth:-

The least squares mean chest girth recorded was 72.62 ± 0.20 cm (Fig.1, table.2), which closely tallied with the values reported by Basu Thakur *et al.* (1967) in Gaddi, Kalra *et al.* (1987) in Nali and Siddalinga Murthy (2001) in Bandur sheep. The chest girth was lower than the values reported by Taneja *et al.* (1993) in Magra (80.03). However, the chest girth was higher than the values reported by Dayananda (1998) in Tumkur strain and Siddalinga Murthy (2001) in Bandur sheep. The chest girth of milk teeth and two teeth age groups varied significantly from other age groups. Significant differences in chest girth due to age were also reported by Taneja *et al.* (1993) in Magra, Dayananda (1998) in Tumkur strain, Taye *et al.* (2010) in Washera Sheep and Siddalinga Murthy (2001) in Bandur sheep. In contrast, Basu Thakar and Negi (1967) reported non-significant effect of age on chest girth in Rampur Bushair breed. The chest girth recorded for males (76.42 ± 0.41 cm) was significantly ($P \leq 0.01$) higher than females (71.43 ± 0.19 cm). Similar observations were made by Nimbkar (1993) in Deccani, Taneja *et al.* (1993) in Magra, Nayak *et al.* (2008) in Ganjam Sheep, Taye *et al.* (2010) in Washera Sheep and Siddalinga Murthy (2001) and Vasundradevi (2013) in Bandur sheep. In contrast, Dayanda (1998) in Tumkur strain, reported non-significant effect of sex on chest girth.

Paunch girth:-

The least squares mean paunch girth measured was 74.99 ± 0.23 cm (Fig.4, table .1) which was tallied with the reports of Nagaraja *et al.* (1996) in Bandur breed. This value is lower than the values reported by Taneja *et al.* (1993) in Magra. However, it was higher than the value reported by Bhadula *et al.* (1979) in Muzzarffarnagari breed. The paunch girth of milk teeth and two teeth groups were lowest and differed significantly from those of remaining 4, 6, and 8 teeth age groups. Age had a significant effect on paunch girth which was in agreement with Taneja *et al.* (1993) in Magra, Dayananda (1998) in Tumkur strain and Siddalinga Murthy (2001) in Bandur sheep. The paunch girth recorded for males was more (78.99 ± 0.48 cm) compared to the females (73.78 ± 0.23 cm) and the difference was found to be highly significant ($P \leq 0.01$). Significant effect on paunch girth due to sex was also reported by Nimbkar (1993) in Decanni, Taneja *et al.* (1993) in Magra, Nayak *et al.* (2008) in Ganjam Sheep, Taye *et al.* (2010) in Washera Sheep and Siddalinga Murthy (2001) and Vasundradevi (2013) in Bandur sheep. However, Dayananda (1998) reported non-significant effect of sex on paunch girth in Tumkur strain.

Conclusion:-

The growth performance of Bandur sheep is quantified under field conditions in the home tract area. The study concludes that the Bandur sheep breed maintained by farmers under grazing system were equally efficient as those maintained at organized farms. Further the body weights and body measurements recorded in Bandur sheep were found similar to other recognized breeds found in southern peninsular India.

Table.1:- Least squares means and standard error of body weight and body measurements at different ages of Bandur sheep.

Particulars	No. of observations	Body weight(kg)	Height at withers (cm)	Body length (cm)	Chest girth (cm)	Paunch girth (cm)
Overall	737	27.46±0.27	53.48±0.24	61.64±0.15	72.62±0.20	74.99±0.23

ABSTRACT

Adaptive wave pipelining is the methodology used for improving the overall performance of Software Defined Radio (SDR). This method is a functional combination of wave pipelining and hybrid technique. Wave pipelining is the methodology used for improving the performance without using the intermediate latches, at the same time it performs the same operation as pipelining. Hybrid technique is the mechanism that is used for introducing registers for achieving the timing constrain. This technique is implemented in the Direct Digital Synthesizer (DDS) which is the integral part of a Digital Down Converter (DDC) in the Digital Front End (DFE)/ Intermediate Frequency (IF) of Software Defined Radio (SDR). This paper presents the principles of wave pipelining and the method for executing the computer algorithm named Coordinate Digital Rotation Digital Computer (CORDIC) using wave pipelining. Xilinx ISE 14.75 design suite is used as the software for simulation of the proposed system.

Introduction:-

A SDR is defined as the functional system that is implemented in software and whose physical layer behavior can be changed by changing the software function. In SDR waveform signal processing is done digitally. The SDR was developed to obtain transmission link inside different bands of spectrum with a single device. SDR is a radio that solves the gap between different Link-layer protocols and provide an ideal solution for the different functional and performance problem by building a generic platform that switches the functionalities using software control. Fig. 1 shows the basic architecture of SDR.

Fig. 2 shows SDR modules in the two-axis graph Processing Intensity vs. Flexibility that determines some of spectrum signal processing associated with SDR system [1]. The upper left area indicates dedicated functions like ADC & DDC that functions with hardware. Flexibility defines the range of ease to complete the function. The lower area determines the functions like analysis and decision making which are functional parameters.

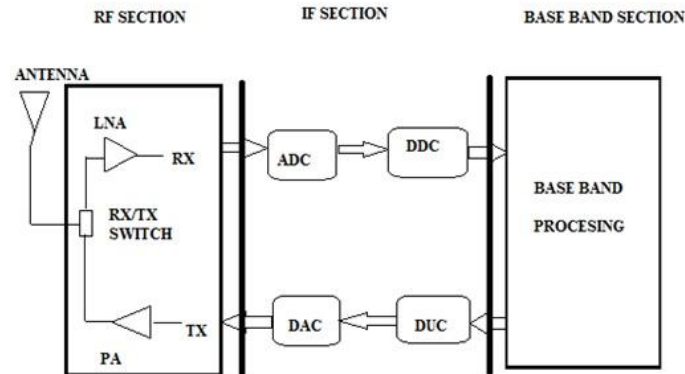

Fig. 1:- Basic architecture of SDR.

Fig. 2:- SDR modules.

Theory of ddc:-

DDC are implemented in communication processors for converting the sample frequencies. Digital down conversion occurs whenever a signal is of any particular frequency band to baseband [6]. The Fig. 3 (a) & (b) shows the functional block diagram, block diagram of DDC. DDC include frequency shifting operation with chain of mixers, decimators and filters in addition to sampling rate conversion.

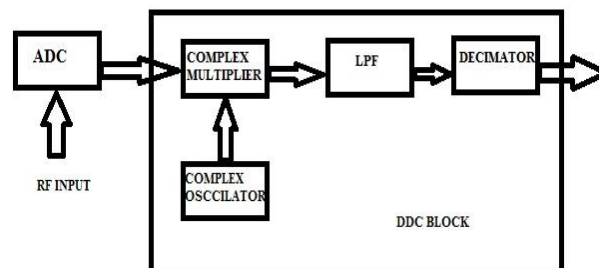

Fig. 3:- (a). Functional Block Diagram of DDC.

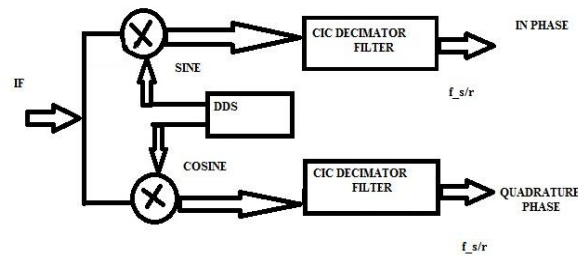

Fig. 3:- (b). Digital Down Converter Block Diagram

DDC is a complex mixer that shifts the frequency of particular range to baseband frequency. The functionality of DDC is mixing and multiplying the retrieved samples with the available digitized stream of data that produces corresponding sine and cosine phase and quadrature channels. DDC's decimate to a lower sampling frequency rate by using different stages of decimation filters. Filtering is performed to limit the bandwidth with the help of linear phase filters. The signals with low data rates are easy to be processed on a low speed functional DSP processor.

DDS/NCO:-

Direct Digital Synthesizer (DDS) is also termed Numerically Controlled Oscillator (NCO). When brought together with a DAC to create an analog output waveform, the system is called a (DDS).

NCO is digital signal generators that generate synchronous, discrete time, discrete value representation of a waveform. In NCO, digital accumulator is used to generate the address into a lookup table. Fig. 4 shows the NCO/DDS functional block diagram.

The system is common, both in hardware and in software. It allows instantaneous changes in the instantaneous frequency or phase of the generated waveform, while maintaining a continuous phase property in the output.

The NCO has 2 parts: [1] Phase Accumulator
[2] Phase To Amplitude Converter

Fig. 4:- NCO/DDS functional block diagram

Theory of cordic algorithm:-

Jack. E. Volder in 1959 coined the Coordinate rotation digital computer (CORDIC). The methodology is applicable for functional execution of digital communication system. It has the characteristics of reading and analyzing the values of any functions that include trigonometric, hyperbolic, arithmetic, vector rotation, and logarithmic [3]. It computes the rotation of vectors by addition and shift operation. They are executed either in rotation mode or vectoring mode [4]. Table 1 shows the output for each mode of operation in different coordinate system. There are three different systems in which the CORDIC can be operated and they are circular coordinate system or in linear coordinate system or in hyperbolic coordinate system.

Fig. 5 shows ith stage for CORDIC from which the basic operating functions of CORDIC for ith iteration can be fetched.

$$\begin{aligned} X_{i+1} &= [X_i - C_i * Y_i * 2^{-i}] * K_i \\ Y_{i+1} &= [Y_i - C_i * X_i * 2^{-i}] * K_i \\ Z_{i+1} &= Z_i - C_i * \arctan(2^{-i}) \end{aligned}$$

C_i Denotes direction of rotation that can have value of 1 or -1. This is determined by the rotational direction whether positive rotation or a negative rotation. K_i Denotes scaling factor of ith iteration that can be computed at the end stage as it is determined by combination of all stages.

The K value is given theoretical as

$$K = \pi_i * K_i = .60725$$

Table 1:- Output for each mode of operation in different coordinate system

COORDINATE	ROTATION ($Z_n \rightarrow 0$)	VECTORIZING ($Y_n \rightarrow 0$)
CIRCULAR(m=1)	$X_n = \frac{1}{K_m} (X \cos Z - Y \sin Z)$ $Y_n = \frac{1}{K_m} (Y \cos Z + X \sin Z)$	$X_n = \frac{1}{K_m} \sqrt{(X^2 + Y^2)}$ $Z_n = Z + \tan^{-1} \left(\frac{Y}{X} \right)$
LINEAR(m=1)	$X_n = X$ $Y_n = Y + X * Z$	$X_n = X$ $Z_n = Z + \left(\frac{Y}{X} \right)$
HYPERBOLIC(m= 1)	$X_n = \frac{1}{K_m} (X * \cosh Z + Y * \sinh Z)$ $Y_n = \frac{1}{K_m} (Y * \cosh Z + X \sinh Z)$	$X_n = \frac{1}{K_m} \sqrt{(X^2 - Y^2)}$ $Z_n = Z + \tanh^{-1} \left(\frac{Y}{X} \right)$

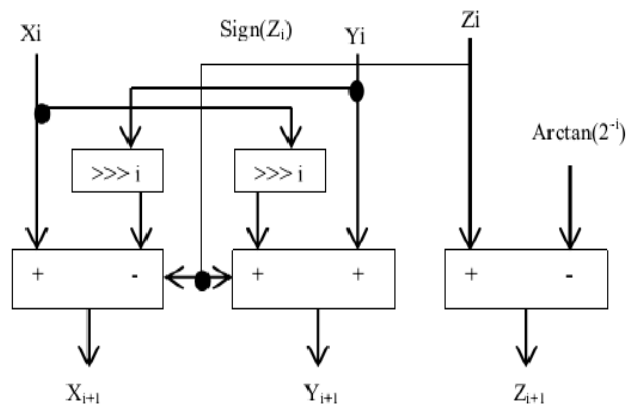

Fig. 5:- ith stage for CORDIC.

Pipeline CORDIC:-

The entire existing system is designed based on pipeline CORDIC. In the pipelined CORDIC architecture, each module is responsible for each elementary rotation occurring in the different modules selected [8] [9]. The modules are combined through immediate latches as shown in Fig. 6. Every stage of CORDIC includes addition, subtraction and shifting operation.

Fig. 6:- Cascading through immediate latches.

Fig. 7:-represent pipelined CORDIC. For a dedicated pipelined architecture, either IN_REGS or OUT_REGS is eliminated there by to improve latency of the design.

Fig. 7:- i^{th} stage for CORDIC

Table 2 shows the pre computed values of the angle α_i needed for the i^{th} iteration that will be stored in ROM memory location.

Table 2:- Pre-computed angles.

I	$2^{-i} = \tan \alpha_i$	$\alpha_i = \arctan(2^{-i})$	α_i in radians
0	1	45^0	0.7854
1	0.5	26.565^0	0.4636
2	0.25	14.063^0	0.245

7	0.0078125	0.4469^0	0.0078
..

Overflow is parameter that occurs whenever a rotational angle crosses from a positive right angle to negative one [5] [9]. To avoid this there is a functional overflow system control is added. This analyses the nature of operand involved in the operation. If an overflow occurs it retains its previous value.

Advantages of CORDIC Pipeline Over Other Architecture:-

1. Less area consumption
2. Low power consumption
3. Lesser delay
4. Greater throughput

On comparison with the performance

Disadvantage:-

1. Area can be reduced
2. Power consumption can be reduced
3. Reducing delay increasing the speed
4. Throughput can be reduced

Proposed system:-

The proposed system is to design further better architecture that can improve the overall performance of SDR in its applications. There by through comparative and analytical study Adaptive Wave Pipelining (AWP) is the technique that can further improve overall performance of SDR in all aspects comparative of area, speed, throughput, delay.

Adaptive wave pipelining (AWP) is the technique that is implemented in the proposed system. It is combinational logic of wave pipelining and hybrid technique. Wave pipelining is the methodology which is similar to pipelining with the difference that intermediate registers are not used for the wave pipelining execution.

Wave pipelining is an alternative pipelining technique that reduces the clock loads, area, power and latency at the same it retains the external functionality and timing of the circuit [12] [13]. Wave pipelining was coined by Cotton [8] and initially named it as maximum rate pipelining. Synchronization of signals in wave pipelining is achieved by manipulating the timing of signals due to lack of intermediate registers. Fig. 8 represents the block diagram of wave pipelining.

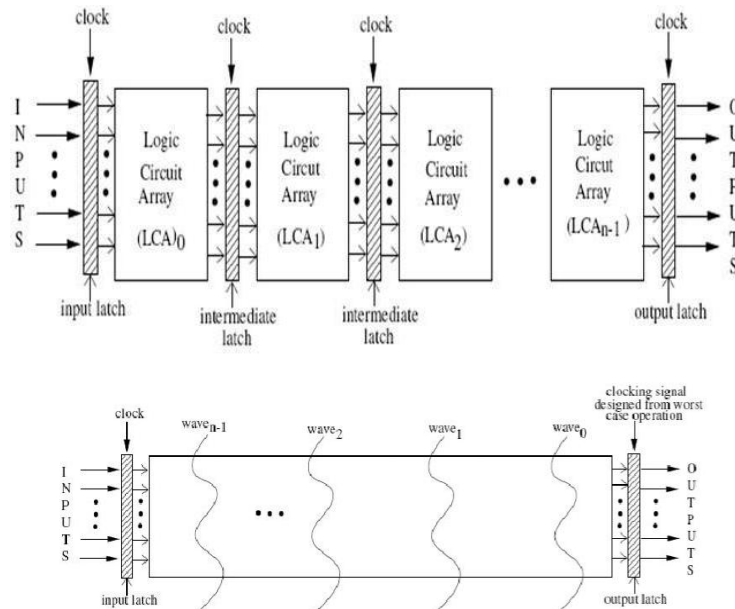

Fig.8:- Block diagram of wave pipelining.

Since there is manipulation of the signals on a periodic basis registers are introduced for the clocking function. This method of introducing the registers in wave pipelining leads to the design of proposed system AWP.

Timing Function:-

Timing requirements for a wave pipeline circuit is done by attaching the registers at the input and output at the periodic basis [14]. The clocking function is derived using certain parameters that help in deriving the timing constrain for the clocking function.

Fig. 9 (a) represents the logic of adaptive wave pipelining and (b) represents the spatial/temporal diagram of wave pipelining.

The timing function is illustrated through the following formulas:-

$$T_{\max} > D_{\max} + T_{\text{set}} + S_{\text{clk}}$$

$$T_{\text{capture}} < T_{\text{clk}} + D_{\min} - (T_{\text{hold}} + S_{\text{clk}})$$

$$T_{\text{clk}} > (D_{\max} - D_{\min}) + (T_{\text{set}} + T_{\text{hold}} + S_{\text{clk}})$$

Where:-

D_{\max} – Is difference between longest path

D_{\min} – Is the difference between shortest path

T_{set} – Set time

T_{clk} – Clock time

T_{hold} – Hold time

S_{clk} – Clock skew

Fig. 9:- (a) Data flow through combinational logic.

Fig. 9:- (b). Temporal/Spatial representation of wave pipelining.

Fig. 10 shows the functional flow diagram, of AWP. In AWP the entire wave pipelining process is executed by introducing the clocking function for registers. These intermediate registers re used for timing constrain.

Fig.10:- Flow diagram of AWP

Advantages of Proposed System:-

1. Reduction in area
2. Reduction in power consumption
3. Increase in speed
4. Increase in throughput

Outputs and case study:-

Table 3:- Theoretical comparison of existing and proposed.

FACTORS	CORDIC PIPELINE	ADAPTIPE WAVE PIPELINING WITH CORDIC
SPEED	LESS	MORE
POWER CONSUMPTION	LESS	MORE
MEMORY UTILISATION	LESS	MORE
THROUGHPUT	LESS	MORE

Outputs obtained for the CORDIC with AWP using Xilinx synthesis.

Inference from the above wave forms fetched is that, whenever each time the value for inputs is forced in the ISim simulator there is corresponding change in the outputs of the wave. The number of register values is clearly available from the output window for further clarification synthesis reports are taken and compared.

Fig. 14. And Fig. 15. Is the utilization summary report that determines the number of registers and LUT's used along with which the delay and maximum frequency, is specified from the synthesis report. These utilization summary of both CORDIC pipeline and AWP are used for comparison.

Device Utilization Summary (estimated values)				
Logic Utilization	Used	Available	Utilization	
Number of Slice Registers	1000	126800	0%	
Number of Slice LUTs	1129	63400	1%	
Number of fully used LUT-FF pairs	968	1161	83%	
Number of bonded IOBs	74	170	43%	
Number of BUFG/BUFGCTRLs	1	32	3%	

Minimum period: 2.398ns (Maximum Frequency: 416.963MHz)

Fig. 14:- Utilization summary for CORDIC pipeline.

Device Utilization Summary (estimated values)				
Logic Utilization	Used	Available	Utilization	
Number of Slice Registers	680	126800	0%	
Number of Slice LUTs	723	63400	1%	
Number of fully used LUT-FF pairs	652	751	86%	
Number of bonded IOBs	50	170	29%	
Number of BUFG/BUFGCTRLs	1	32	3%	

Minimum period: 2.036ns (Maximum Frequency: 491.087MHz)

Fig.15:- Utilization summary for AWP

Comparison and analytical study:-

The entire proposed system stated as AWP, is executed using the Xilinx ISE 14.75 and the outputs are fetched. The outputs are compared with the help of utilization summary and synthesis reports.

Graph representations are made for comparison and displaying the comparative area, delay and frequency (throughput). Table 4 shows the practical comparison of the both systems using the physical values fetched after running the codes in Xilinx ISE 14.75 design suite. Fig. 16,17,18,19 are the graph representation done from the synthesis report and utilization summary.

Fig. 16:- Graph representation of area utilization

Inference: From the above graph it is clear to knowledge that the number of slices used by AWP is lesser than the number of slices used by CORDIC pipeline. Hence the area occupied by AWP is less compared to other method.

Fig. 17:- Graph representation of utilization of lut's

Inference: the above graph denoted the number of LUT's used by the two different processes. From the graph it is clear that the number of LUT's used by AWP is lesser than the comparative method.

Fig. 18:- Delay analysis

Inference: the above graph is plotted between number of slice LUT's used vs delay. From the previous graph representation it is clear that CORDIC pipeline uses more LUT's than AWP. Hence the delay acquired for CORDIC pipeline is more than the proposed system that is AWP.

Fig. 19:- Power response.

Inference: the above graph is plotted between number of registers used vs power. Since the number of registers used is less in AWP the power consumed in this method is less. This is been analyzed by plotting the graph

Table 4:- Physical value comparison.

FACTORS	CORDIC PIPELINE	ADAPTIVE WAVE PIPELINING WITH CORDIC
NUMBER OF SLICE REGISTERS USED	1000/126800 UTILISATION-0%	680/126800 UTILISATION-0%
NUMBER OF SLICE LUT'S USED	1129/63400 UTILISATION-1%	723/63400 UTILISATION-1%
FREQUENCY	416.98Mhz	491.087Mhz
DELAY	2.398ns	2.036ns
POWER	$1129 \times .082 = 92.578W$	$723 \times .082 = 59.286W$

Conclusion:-

The entire proposed system is designed and executed using Xilinx. The function is designed in such a manner the end users can modify them according their requirements and application. Since FPGA is chosen as target technology the design has resulted in consumption of low area, power with increased speed and throughput.

The entire project work is focused on designing of efficient DDS to improve the efficiency of DDC and improve the overall performance of SDR. In future the entire DDC structure can be designed with the developed AWP technique and better efficient SDR structure can be evolved.

Abstract

With ever changing global scenario in business sector, uses of ERP (Enterprise resource Planning) to cut down on accounting cost have gained a rapid growth. Not only large enterprises, but medium as well as small enterprises have gone on the path of ERP implementations. Using an ERP in your accounting, not only cuts down the time consumption in maintaining accounting records, but also helps in managerial accounting and decision making with ready to use real time data on click of a button. This paper has been analyzed on impact of ERP implementations on the management accounting process on different kinds of industries. Previous study talks about many references to factors underlining successful ERP implementations with reference to plummeting management accounting decision making burden. Multiple regression analysis has been done on the basis of factors and methods of management accounting extracted from review of literature. The focus of this paper is to give a scenario for further research with respect to impact on management accounting as a result of ERP implementations.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

With the rapid advancement of ERP systems in LE's and SME's the management has got sheer benefits of quick decision making process with the help of readily available data on click of a button. But does implementation of an ERP into a company's environment actually affects the process of Management Accounting.

ERP is a planning philosophy enabled with software that attempts to integrate all the business processes of all the departments and functions across a company on to a single computer system that can serve particular needs of the different departments. ERP combines all the business requirements of the company into a single, integrated software program that runs of a single database so that the various departments can more easily share information and communicate with each other. Fig.1 shows ERP integrated system. (Altekar, 2009)

Figure 1:- ERP Integrated Systems.

Management Accounting is a process of identifying, measuring, analyzing, interpreting and communicating information in pursuit of an organization's goals. Management accounting is an integral part of management process, and managerial accountants are important strategic partners in the organization's management team. In pursuing its goals, an organization acquires resources, hires people and then engages in an organized set of activities. It is up to management team to make the best use of organizations resources, activities and people in achieving the organization's goals. The management accounting has four activities involved:

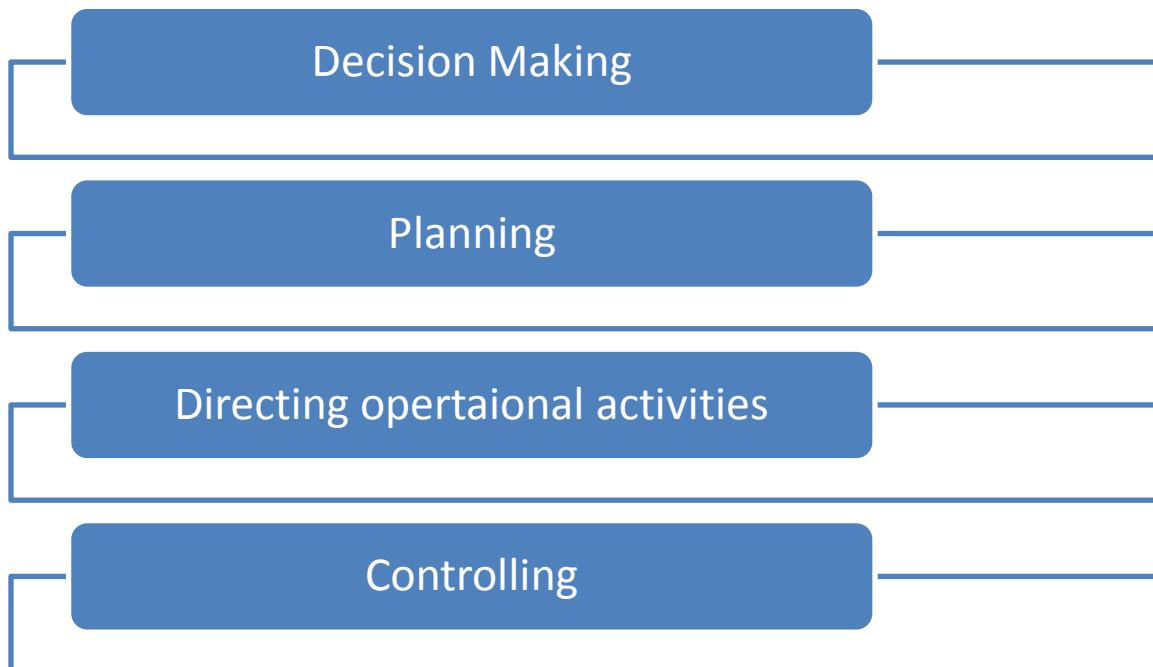

Figure 2:- (Ronald W Hilton, 2008)

Management Accounting techniques which are usually followed in any LE or SME are:-

1. Activity based costing
2. The balanced score card
3. Customer Satisfaction surveys
4. Target Costing
5. Life cycle costing
6. Benchmarking
7. Non-Financial key performance Indicators
8. Others

The combination of ERP and Management accounting does brings changes in a company's day to day activities. Management accounting relies on combined data of all the departments combined together to attain a common decision making goal. With the help of ERP this can be done easily as the data is readily available. Now the hypothesis arise as to whether implementing an ERP can be beneficial to a company or it can bring heavy costs in implementation as compared to easy data availability to the management.

Objective of Research and Hypothesis:-

The research has been done with an objective of analyzing the post ERP implementation effect of management accounting processes. The major objectives of research are listed below:

1. To find out the impact of ERP implementation on the organizations overall management accounting process.
2. To find whether management accounting processes are related to size of organization in an ERP environment.
3. To find the impact of Management processes on different factors of better performance in an ERP environment.

The hypothesis of research is as follows:**. Objective 1:- Hypothesis**

H_{a0}: ERP implementation has a positive impact on management accounting Processes.

H_{a1}: ERP implementation does not bring a positive impact on management accounting processes.

Objective 2:- Hypothesis

H_{b0}: To find whether management accounting processes are related to size of organization in an ERP environment.

H_{b1}: There is no relation between management accounting processes to size of organization in an ERP environment.

Objective 3:- Hypothesis

H_{c0}: All management process has similar impact in an ERP environment

H_{c1}: All management process has different impact in an ERP environment.

Review Of Literature:-

The deployment of ERP systems generally results in significant reductions in the routine tasks of management accountants [(Lowe, 2004); (Arnold, 2006); (Drury, 2008)] and the subsequent a transition in their role from one of information gatherer or transaction-orientated role, to one of information analyst or business orientated role [(Granlund M. a., 1998); Hunton, 2002] or more simply from the back office to the front office (Holtzman, 2004). Furthermore, management accounting practices, whether traditional or modern, may become more efficient and effective when supported with ERP systems (see, for example, Edwards, 2001; Baxendale and Jama, 2003; Lea and Min, 2003; Scapens and Jazayeri, 2003; He, 2007; Lea, 2007). This is possible through greater information integration, greater flexibility in information access, and superior functionality (Booth et al., 2000). More recently, the enrichment of ERP systems with new ES, such as business intelligence (BI) systems, appears to have had a significant boost to the role of management accounting. BI systems normally sit on top of ERP systems, and are intended to bridge transactional efficiency with strategic planning. BI comprise a set of tools used for data analysis, query and reporting (Elbashir et al., 2008) and supporting strategic decision-making (Fahy, 2001; Bucher et al., 2009; Mikroyannidis and Theodoulidis, 2010) by providing managers with insights into their business operations (Seah et al., 2010). BI systems are composed of three complementary and interrelated tools, namely data warehousing, online analytical processing (OLAP), and data mining. As Teorey et al. (2006) describe, data warehousing deals with the storage, maintenance and retrieval of historical data; OLAP provides quick answers to ad hoc queries; and data mining is a collection of algorithms which find patterns in the data and return valuable user information. (Nikolaos Vakalfotis, July 2011)

(Gullkvist, Sept, 2013) Says empirical findings demonstrate a statistically significant influence of a successful ERP implementation as having a direct effect on changes in MA practices. While Sangster et al. (2009) identified increased data quality, improved decision-making and changes in accountants tasks under successful ERP implementations, this study adds to those findings by emphasizing change in MA techniques as associated with successful ERP implementation. Consistent with reasoning in prior research (Granlund and Malmi, 2002), the results of this study indicate that time since ERP adoption is a significant determinant of changes in MA techniques, but also that the majority of the changes occur within eight years after ERP implementation. Further, late ERP adopters perceive greater changes in MA techniques than early adopters. One possible explanation could be that late adopters perceive the changes as greater because of the short time since ERP implementation. Another explanation could be that newer software versions include features and functionality that were missing from their predecessors, and which could be driving the changes already at the ERP implementation stage. Some respondents maintained in an open question in the questionnaire that change in MA techniques occurred simultaneously with the ERP implementation, not afterwards. Furthermore, the findings indicate that the scope of installation, local or global, is a significant determinant of changes in MA techniques. This is an important finding, as many organizations in recent years have pursued global ERP implementation. As many previous studies on the attributes of MA change have been conducted at an early stage of ERP implementation and early in the first decade of the century, this study offers an update, and also indicates that change may occur over time.

Where (Hyvonen, 2003) gave a comparison of ERP: Enterprise Resource Planning and BoB: Best of breed with respect to management accounting systems. He collected data through 300 postal questionnaires from large and middle sized industrial units in Finland. The questionnaire addressed questions concerning IS implementation (why, how and by what the IS project was introduced), management accounting function, and the use of advanced management accounting techniques. The results obtained indicate that financial departments have been more interested in traditional BoB systems, while other departments have concentrated more on ERP solutions. Further, as the articulated motives behind the IS project were strategic, and moreover technical in nature, the solution in most cases was ERP, while in the cases where motives were either strategic or technical, the choice was BoB. Otherwise, there were no statistically significant differences between the groups of BoB or ERP adopters, and the problems perceived in management accounting or the adoption of advanced management accounting techniques (e.g. ABC, ABM and BSC).

Two seminal studies are (Granlund M. a., 2002) and (Scapens, 2003). Granlund and Malmi (2002) undertook exploratory field studies at ten firms. They recognized that ERP systems provided easier and faster access to standardized operational data, enhanced forecasting, emphasized the accounting department as the "nerve center", reduced the need for accountants to handle routine tasks, and gave accountants more time for sophisticated analyses. Nevertheless, they concluded (Granlund and Malmi, 2002, p. 309) "that there has been no major direct or indirect impact so far on management accounting and management control systems". Granlund and Malmi (2002) appear to be assessing the impact of ERP systems on management accounting from the third or information level, rather than the physical and transactional levels, in recognizing the greater ease and speed in accessing standardized data and in recognizing that the work of management accountants had shifted towards more analysis and fewer routine tasks. In recognizing better information, they did not mention that significant changes to transaction processing were necessary for better information. Moreover, they did not mention the standardization of the state-of-the-art physical processes that were necessary to support improved transaction processing.

(Rohde, 2006) Had done a paper to contribute to the body of knowledge about to what extent integrated information systems, such as ERP and SEM systems, affect the ability to solve different management accounting tasks. They made a questionnaire survey with 349 responses and data so collected was analyzed using linear regression models. Analyses indicate that ERP systems support the data collection and the organizational breadth of management accounting better than SEM systems. SEM systems, on the other hand, seem to be better at supporting reporting and analysis. In addition, modern management accounting techniques involving the use of non-financial data are better supported by an SEM system. This indicates that different management accounting tasks are supported by different parts of the IIS. On the basis of the findings, there is a need to consider the potential of closer integration of ERP and SEM systems in order to solve management accounting tasks.

(Sánchez-Rodríguez & Spraakman, 2012) Studied eight international scientific journals published between 1990 and 2010 to relationship between ERP and Management Accounting. They found on the basis of conceptual study that

not much work has been done in ERP and MA as such. They also concluded that SAP has a major role when it comes to ERP in Management Accounting decision making. They recommended area for further research in this field as not much work has been done on following:

- What are the critical context factors for implementation of ERP system?
- Analysis and interaction between ERP and organizational structure.
- Impact of ERP on management accounting and management accountant.
- The integration of BI, Cloud computing and ERP.

(Malinic & Todorovic, 2012) Talks about the effect of SAP on management accounting in Serbian industrial enterprises. They studied 9 enterprises from different industry to explore the relationship between SAP, as only one of the ERP software and management accounting changes. They concluded the impact of SAP on MA is modest in relation to expectation "Granlund and Malmi (2002)". Also they concluded that there is no causal relationship between ERP implementation and management accounting procedures. They suggested certain remarkable points to be considered while comparing MA and ERP:

- SAP implementation is complex at initial stage.
- SAP implementation is time consuming and it takes a lot of time to implement in all the sectors of the organizations.
- Time gap between implementation and go live is another important factor which influences the decision.
- Wrong decision in ERP tie-ups are also a reason of failure.
- SAP brings in time effectiveness in managerial decision making.

Again (Sangster, Leech, & Grabski, 2009) also found out by floating 700 questionnaires in different IT professionals that SAP was the dominate vendor of ERP implementations. On the basis of their research it has been identified that ERP implementations results in changes in the tasks of the management accountants, with the quality of many operational factors, such as inventory control, and the overall quality of data and information improving irrespective of the success or failure of the implementation. When an ERP implementation is successful, management accountants have time for other, less mundane activities; and their role becomes more enriching as a result.

Table 1:- Table showing Comparison of factors for performance measure of ERP and Management Accounting Relationship

Authors	(Gaertner & Feldbauer-Durstmüller, 2012)	Hyvonen (2003)	(Malinic & Todorovic, 2012)	(Sangster, Leech, & Grabski, 2009)	(Sangster, Leech, & Grabski, 2009)	(Malinic & Todorovic, 2012)	(Nikolaos Vakalofotis, July 2011)	(Gullkvist, Sept, 2013)	(Rohde, 2006)	Summary
Factors

Budgeting	LS	GS	GS	GS		GS	GS		GS	GS

Note:-

GS= Good Support for inclusion as a performance measures in ERP and Management Accounting Relationship. (Performance measure referenced in 50% or more of studies in the table).

LS= Low support for inclusion as a performance measures in ERP and Management Accounting Relationship. (Performance measure referenced in less than 50% of studies in the table).

Table 2:- Table Showing Methods of Management Accounting Implemented / Accepted in studies under review

Authors	(Gaertner & Feldbaue r-Durstmueller, 2012)	Hyvonen (2003)	(Malini c & Todovic, 2012)	(Sangster, Leech, & Grabski, 2009)	(Sangster, Leech, & Grabski, 2009)	(Malini c & Todovic, 2012)	(Nikolaos Vakalof, July 2011)	(Gullkvist, Sept, 2013)	(Rohde, 2006)	Summary
Methods										
Activity Based Costing	GS	GS	GS	LS	GS	GS	LS	GS	GS	GS
Balance Score Card	GS	GS	LS	LS	GS	GS	LS	GS	GS	GS
Target Costing	GS	GS	LS	LS	GS	GS	LS	GS	GS	GS
Lifecycle Costing	GS	GS	LS	LS	GS	GS	LS	GS	GS	GS

Note:-

GS= Good Support for inclusion as a performance measures in ERP and Management Accounting Relationship. (Performance measure referenced in 50% or more of studies in the table).

LS= Low support for inclusion as a performance measures in ERP and Management Accounting Relationship. (Performance measure referenced in less than 50% of studies in the table).

Based on the review of literature it can be ascertained that Organizational Structure, Management accounting and accountants, integration of business intelligence, Performance measurement of management decisions, cost accounting, data analysis, reporting, budgeting etc. are good support for measuring the relationship between ERP and Management Accounting while factors like corporate size, strategy, cloud computing etc. are low support factors with respect to it. As far as methods of management accounting are concerned, most of the papers under review suggested that all the methods so recognized under table 2, are equally been taken under post ERP systems for management accounting and control.

How Does Enterprise Resource Planning And Management Accounting Are Interrelated:-

Enterprise resource planning is one of the software tools which make an organization's data management easy and handy. An organization with too many departments each more or less linked to finance and accounting department makes it difficult to extract data for managerial decision making in manual accounting systems. With introduction of ERP large industries like Big Organizations like Reliance, Essar, Tata, L & T, Coca Cola, Adani, Bombay Dyeing, Amul Birla etc. which are widely spread all over the globe and has offices/ plants everywhere has got a benefit of easy data access with click of a button. ERP helps a management accountant to make decision on the basis of MIS data which is available on his table through software popularly known as ERP.

The relationship between management accounting and ERP can be summaries on the following basis:-

- ERP implementations are huge and are time consuming. If an ERP implementation takes more time than its estimated one, it becomes costly and has a negative impact on management decision making.
- ERP can give all the past data but cannot give future data to make a 100% accurate decision on the basis of it. Budgets prepared on ERP are based on historical data. This cannot be considered accurate when it comes to non-accounting factors influencing managerial decision.
- For Activity based costing, customer satisfaction survey, non-financial key performance indicators etc. kinds of management accounting processes only ERP cannot suffice the requirement of decision making. It needs human intervention (That of management accountant) and outside data (That of customers or competitors act) to make decisions.

- ERP like SAP which is very user's friendly and can be implemented with minimal customization is widely accepted by LE's. But for SME's, an ERP like SAP is more costly and implementing any other cheaper ERP makes it very difficult to extract managerial accounting data for the purpose of decision making.
- First time adaptability of any ERP into a manual accounting firm is very difficult. Getting a user's acceptance on ERP is an issue for vendors. At the same time from implementation to first positive use, there is a time lag which makes it difficult for management accountant to make decision and use an ERP.
- With global competitive environment ERP has become a fashion rather than a necessity. Companies often implement ERP just because their competitors are doing so, without acknowledging their budgets and requirements. These kinds of implementations also hampers the quality of decision making in management accounting when an inappropriate software is implemented within organization to hamper day to day working.

Research Methodology:-

The purpose of this paper is to investigate the research done in the field of ERP and management accounting. For this, the database of established scientific management accounting journals and information system journals were investigated. The list of journals under the study was as follows:

Accounting Journals	Information system journals
<ul style="list-style-type: none"> • Management Accounting Journal (MAJ) • Journal of Management (JM) • European Accounting Review (EAR) • International Journal of Economic Science and applied research • Auditing and Accountability Journal. 	<ul style="list-style-type: none"> • International journal of accounting information systems. • Journal of Enterprise Information Management • Journal of Information System & Technology Management

These journals are chosen for the purpose of extracting the review of literature also the methodologies and extract on account of inter-relation between ERP and Management accounting.

The method considered under the research was to recognize the most reviewed or analyzed methods for the purpose of determining relationship in ERP and Management accounting. Based on the literature review factors of testing the inter-relationship of ERP and management accounting were identified as Organizational structure, Management accounting and management accountant, business intelligence, performance of firm, cost accounting procedures, data analysis, reporting and budgeting.

Also, four management accounting techniques viz., Activity Based Costing (ABC), Balance Score Card (BSC), Target Costing (TC) and Life cycle costing (LC) were also identified to find implications of these management accounting practices in an ERP environment.

Research design and Data Collection:-

A five point likert scale questionnaire was developed to find users view on management accounting process in ERP environment. The questionnaire was sent to 70 managers / users of ERP in different type of manufacturing organizations have been given these questionnaires to be filled for the purpose of data analysis. 40 users /managers responded and on the basis of the data so collected multiple regression analysis was to analyses the data.

Data Analysis and findings:-

The questionnaire so received from the sources only 30 were considered for ANOVA .10 responses were rejected on the grounds of either not completely filled in or filled by a non-user. The data analysis was done with the help of ANOVA using excel from data analysis option.

The data collected was segregated and drafted in excel and the ANOVA was generated as follows:

Objective 1:- To find out the impact of ERP implementation on the organizations overall management accounting process

Multiple regression analysis was done for to check all the Management Accounting techniques relations to factors of performance evaluation in an ERP environment. The data gave following results.

Regression Statistics	
Multiple R	0.76
R Square	0.57
Adjusted R Square	0.50
Standard Error	0.88
Observations	29.00

ANOVA	df	SS	MS	F	Significance F
Regression	4	25.07	6.27	8.03	0.00
Residual	24	18.73	0.78		
Total	28	43.79			

	Coefficients	Standard Error	t Stat	P-value	Lower 95%	Upper 95%	Lower 95.0%	Upper 95.0%
Intercept	0.618	0.495	1.248	0.224	-0.404	1.641	-0.404	1.641
ABC	3.109	1.108	2.805	0.010	0.822	5.396	0.822	5.396
BSC	2.000	0.883	2.264	0.033	0.177	3.823	0.177	3.823
TC	-3.301	1.284	-2.571	0.017	-5.950	-0.651	-5.950	-0.651
LC	-1.192	0.629	-1.896	0.070	-2.489	0.106	-2.489	0.106

The P-value when more than 0.05 needs to be excluded from the list of independent variables (ABC, BSC etc.). As P value 0.05 or greater says that the predicted value of the variable is as such it is insignificant for the analysis of the outcome. As lifecycle costing is the independent variable whose P- value is more than 0.05, it means that the variable is insignificant for the purpose of analysis.

Checking on Significance of f which is coming to 0.000294188 shows that the variables so considered in the analysis is although below 0.05 but is significant for the analysis.

Looking at coefficient we can see again LC (-1.191881919) is totally insignificant along with TC (3.300738007) which is in negative. This show that on the basis of data so collected the only significant management accounting practice post ERP adoption are ABC and BSC. This analysis can also change as the number of users are too less as compare to world ERP using organization.

Here on the basis of above analysis we partially accept H_{a0} : ERP implementation has a positive impact on management accounting Processes.

Objective 3:- To find the impact of Management processes on different factors of better performance in an ERP environment.

Where, analysis of each management practice under study like ABC, BSC, TC and LC individually w.r.t the factors of performance evaluation gave another picture as:

Multi regression analysis of Activity costing (Dependent Variable) to Factors of performance evaluation (Independent variables)

Regression Statistics	
Multiple R	0.774
R Square	0.598
Adjusted R Square	0.438
Standard Error	1.068
Observations	29.000

ANOVA					
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>
Regression	8	34.01	4.25	3.73	0.01
Residual	20	22.82	1.14		
Total	28	56.83			

	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>	<i>Lower 95.0%</i>	<i>Upper 95.0%</i>
Intercept	-0.61	1.00	-0.61	0.55	-2.69	1.47	-2.69	1.47
Organizational Structure	0.20	0.19	1.05	0.30	-0.20	0.60	-0.20	0.60
MA	0.14	0.21	0.68	0.50	-0.30	0.59	-0.30	0.59
BI	0.13	0.22	0.59	0.56	-0.33	0.60	-0.33	0.60
Perf. Man	0.36	0.18	1.99	0.06	-0.02	0.73	-0.02	0.73
Cost Acc	0.07	0.16	0.41	0.69	-0.27	0.40	-0.27	0.40
Data Analysis	-0.26	0.18	-1.42	0.17	-0.64	0.12	-0.64	0.12
Reporting	0.06	0.16	0.38	0.70	-0.27	0.39	-0.27	0.39
Budgeting	0.69	0.21	3.36	0.00	0.26	1.12	0.26	1.12

Again when we check the analysis data, P-value of most of the variables except data analysis and performance management are more than 0.05 i.e., totally insignificant. It shows that as far as ABC analysis is concerned, the performance of management accounting in post ERP companies is mostly likely to be depending on whether the organization is able to do better data analysis of the records in ERP.

A significance *f* on the contrary shows that independent variables are significant and ABC in an ERP environment can be a significant measure for the analysis.

Multi regression analysis of Balance Score card (Dependent Variable) to Factors of performance evaluation (Independent variables)

<i>Regression Statistics</i>	
Multiple R	0.678
R Square	0.460
Adjusted R Square	0.244
Standard Error	1.217
Observations	29

ANOVA					
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>
Regression	8	25.22	3.15	2.13	0.08
Residual	20	29.60	1.48		
Total	28	54.83			

	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>	<i>Lower 95.0%</i>	<i>Upper 95.0%</i>
Intercept	-0.07	1.14	-0.06	0.95	-2.44	2.30	-2.44	2.30
Organizational Structure	0.15	0.22	0.69	0.50	-0.31	0.61	-0.31	0.61
MA	0.20	0.24	0.83	0.42	-0.30	0.70	-0.30	0.70
BI	0.11	0.25	0.42	0.68	-0.42	0.64	-0.42	0.64
Perf. Man	0.25	0.20	1.22	0.24	-0.18	0.68	-0.18	0.68
Cost Acc	0.33	0.18	1.79	0.09	-0.05	0.71	-0.05	0.71
Data Analysis	-0.26	0.21	-1.25	0.22	-0.69	0.17	-0.69	0.17
Reporting	0.05	0.18	0.27	0.79	-0.33	0.42	-0.33	0.42
Budgeting	0.42	0.23	1.78	0.09	-0.07	0.91	-0.07	0.91

Looking at the P value many factors like Organizational structure, management accounting & accountant, performance management, Cost accounting, data analysis and budgeting are significant factors for analysis of balance score card as a good practice in firms using ERP.

Multi regression analysis of Target Costing (Dependent Variable) to Factors of performance evaluation (Independent variables)

<i>Regression Statistics</i>						
Multiple R	0.745746942					
R Square	0.556138501					
Adjusted R Square	0.378593901					
Standard Error	1.023929427					
Observations	29					
ANOVA						
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>	
Regression	8	26.27274987	3.284093733	3.13238759	0.018228166	
Residual	20	20.96862945	1.048431472			
Total	28	47.24137931				

	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>	<i>Lower 95.0%</i>	<i>Upper 95.0%</i>
Intercept	-0.34	0.96	-0.36	0.72	-2.34	1.65	-2.34	1.65
Organizational Structure	0.14	0.18	0.75	0.46	-0.25	0.52	-0.25	0.52
MA	0.12	0.20	0.58	0.57	-0.30	0.54	-0.30	0.54
BI	0.15	0.21	0.70	0.49	-0.30	0.59	-0.30	0.59
Perf. Man	0.18	0.17	1.04	0.31	-0.18	0.54	-0.18	0.54
Cost Acc	0.22	0.15	1.46	0.16	-0.10	0.55	-0.10	0.55
Data Analysis	-0.06	0.17	-0.37	0.71	-0.43	0.30	-0.43	0.30
Reporting	0.07	0.15	0.48	0.63	-0.24	0.39	-0.24	0.39
Budgeting	0.53	0.20	2.70	0.01	0.12	0.94	0.12	0.94

Accept for budgeting no other factors shows a significant P value for the purpose of analyzing target costing as a significant dependent variable on the independent variables for the purpose of analysis of variance. A 0.018228166 of "Significance f" make the analysis significant for the purpose of performance evaluation.

Multi regression analysis of Lifecycle Costing (Dependent Variable) to Factors of performance evaluation (Independent variables)

Regression Statistics								
Multiple R	0.683918904							
R Square	0.467745067							
Adjusted R Square	0.254843094							
Standard Error	1.229771586

Residual	20	30.24676307	1.512338154					
Total	28	56.82758621						
	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>	<i>Lower 95.0%</i>	<i>Upper 95.0%</i>
Intercept	-0.71	1.15	-0.62	0.54	-3.11	1.68	-3.11	1.68
Organizational Structure	0.36	0.22	1.63	0.12	-0.10	0.82	-0.10	0.82
MA	0.41	0.24	1.69	0.11	-0.10	0.92	-0.10	0.92
BI	0.15	0.26	0.60	0.56	-0.38	0.69	-0.38	0.69
Perf. Man	0.35	0.21	1.67	0.11	-0.09	0.78	-0.09	0.78
Cost Acc	0.28	0.18	1.51	0.15	-0.11	0.67	-0.11	0.67
Data Analysis	-0.15	0.21	-0.73	0.47	-0.59	0.28	-0.59	0.28
Reporting	-0.09	0.18	-0.49	0.63	-0.47	0.29	-0.47	0.29
Budgeting	0.35	0.24	1.46	0.16	-0.15	0.84	-0.15	0.84

A Significance F 0.073398625 shows that again the dependent variable has a significant relationship with the independent variables. Although most of the factors again have a P-value which is below 0.05 recommending that target costing is being taken care in ERP environment as a management accounting practice.

On the basis of above we can again accept H_{b0} : As out of four three of the Management processes can be considered as significant in ERP environment on the basis of factors of performance.

Objective 2:- To find whether management accounting processes are related to size of organization in an ERP environment.

Regression Statistics						
Multiple R	0.2816007					
R Square	0.079298954					
Adjusted R Square	-0.07415122					
Standard Error	1.475603287					
Observations	29					
ANOVA						
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>	
Regression	4	4.500899256	1.125224814	0.516773307	0.724121854	
Residual	24	52.25772143	2.17740506			
Total	28	56.75862069				

	Coefficients	Standard Error	t Stat	P-value	Lower 95%	Upper 95%	Lower 95.0%	Upper 95.0%
Intercept	3.72	0.83	4.49	0.00	2.01	5.44	2.01	5.44
ABC	-0.09	0.33	-0.28	0.78	-0.78	0.59	-0.78	0.59
BSC	0.14	0.35	0.39	0.70	-0.59	0.87	-0.59	0.87
TC	0.01	0.41	0.02	0.98	-0.85	0.87	-0.85	0.87
LC	-0.31	0.37	-0.83	0.41	-1.08	0.46	-1.08	0.46

Looking at the regression analysis of the data on the basis of four practice of management accounting a standard error of 1.47 and a Significance “f” of 0.724121854 (which is above 0.05) shows that the size of firm is not being significantly related to management practice. Also the P-value of all the independent variables is more than 0.05 which signifies that none of the factor has any significant relationship with type of organization and hence we reject the null hypothesis and select the alternative hypothesis.

H_{b1}: There is no relation between management accounting processes to size of organization in an ERP environment.

Conclusion and Recommendations:-

This small empirical study on ERP and management accounting has given an area for further research as to how implementation of ERP has an impact on management decision making. So far from the empirical study it can be concluded that ERP when implemented gives a very positive impact on management accounting as to decision making in the field of production, make or buy decisions, BOM, supply chain management, outsourcing, etc. ERP's like SAP, PeopleSoft, MSD and others needs to be studied in detail industry wise to comment upon the acceptance as to management accounting. Although ERP has gain rapid advancement in last decade, it is still an unread book for researchers with the prospective of end users eyes. **Thus, although we accept out hypothesis as to “there is a positive relationship between ERP implementations and Management accounting”**, but at the same time we also had restricted this paper to a small group of users/ managers and the research analysis and outcomes can come to total contradiction when it comes to the huge sample in different types of companies using ERP. As this research is primary investigation opening up the doors for a broader frontier, it is highly recommended that before coming to any conclusion factors like type of ERP for MA processes, many other kind of management practices and large pool of end users view should be considered for the higher end research.

Allopathic, dentinal hypersensitivity, dentifrices, gingivitis, herbal, plaque.

Abstract

Background: Dentinal hypersensitivity is a transient condition that often resolves with the natural sclerotic obturation of dentinal tubules. A potent topically applied in-office desensitizing treatment is indicated as the choice of treatment when dentinal hypersensitivity is localized to one or two teeth.

Aim: The present study aimed to evaluate and compare the clinical efficiency of two commercially available herbal and allopathic dentifrices that were used in treating dentinal hypersensitivity, additionally this study evaluates their effectiveness in reducing plaque and gingivitis on both the groups.

Materials and Methods: 30 patients aged 20-60 years reporting with dentinal hypersensitivity were randomly assigned to 2 groups of 15 patients each. Plaque index scores and gingival bleeding index scores were evaluated and response to air stimuli and thermal stimuli were measured using visual analogue scale at baseline, 7th, and 30th day.

Statistical Analysis: Statistical analysis was carried out using Mann Whitney u test, Friedman test and Wilcoxon sign rank test.

Results: Allopathic dentifrice group showed better results in reducing dentinal hypersensitivity during 7 days assessment whereas at 30 days of evaluation herbal dentifrice group showed significant reduction in dentinal hypersensitivity. It also showed that there was no statistical significant difference between both the groups but herbal dentifrice showed better results in gingival index scores and plaque index scores.

Conclusion: Allopathic dentifrices is fast acting whereas herbal dentifrice has long term effect and has better anti plaque and anti gingivitis effect compared to allopathic dentifrice.

Introduction:-

Dentinal hypersensitivity (DH) is a characteristic pain arising from exposed dentine, typically in response to various stimuli such as thermal, evaporative, tactile, osmotic or chemical, which cannot be attributed to any other form of dental defect or pathology.¹

When constantly present over a long time, DH can provoke chronic discomfort and emotional distress.² In addition; it can make dental plaque control difficult. According to hydrodynamic theory by Braennstroem and Astroem,

Corresponding Author:- Swapna Ediga.

Address:-Dept of Periodontics and Oral Implantology, A.M.E.S Dental College and Hospital, Raichur, Karnataka 584101.

enamel or cementum loss in cervical areas and the consequent opening of dentinal tubules to the oral environment, under certain stimuli, allows the movement of dentinal fluid inside the tubules, indirectly stimulating the extremities of the pulp nerves, causing pain.³ It was also found that open dentinal tubules serve as pathways for the diffusive transport of bacterial elements in the oral cavity to the pulp, which may cause a localized inflammatory pulpal response.⁴ Microscopic examination reveals that patent dentinal tubules are more numerous and wider in hypersensitive dentine than in non-sensitive dentine.⁵

Various strategies have been used in the treatment of DH which include lasers, iontophoresis, dentine sealers and soft tissue grafting.⁶ Toothpastes are the most widely used dentifrices for delivering over-the-counter desensitizing agents.⁷ Agents for topical relief of dentine hypersensitivity either block the exposed dentine tubules or have a direct desensitizing effect on the pulpal nerve fibres.^{8,9} The use of potassium nitrate as an effective desensitizing agent dates back to the testimonial report of Hodosh in 1974.¹⁰ Since then, many pastes containing potassium chloride or potassium citrate have been made available.¹¹

Recently there has been a growing interest in natural products, and herbal based toothpastes have been found as effective as the conventionally formulated dentifrice in the control of plaque and gingivitis.¹²

This was the first study which was conducted to assess and compare the efficacy of a commercially available novel herbal dentifrice containing potassium nitrate and *Spinacia oleracea* to an allopathic dentifrice which contains potassium nitrate on DH and also to evaluate anti plaque and anti gingivitis effects of both the tooth pastes over a period of 4 weeks.

Methodology:-

A total of 30 patients were selected from department of periodontics and oral implantology, A.M.E'S Dental college and hospital, Raichur, Karnataka, India with dentinal hypersensitivity. The individuals selected at baseline had a history of DH caused by gingival recession, cervical erosion, and attrition. Subjects age ranging from 20-60 years were required to have 20 natural permanent teeth and at least two teeth with a VAS score of ≥ 4 . Allergic to ingredients, teeth with occlusal overload, teeth with caries, defective restorations, and chipped teeth were excluded.

After obtaining patient informed consent, oral prophylaxis with oral hygiene instructions was given. Randomisation was done to allocate patients in two groups, group A-Herbal dentifrice -HiOra K, (The Himalaya Drug Company Research and Development, Makali, Bangalore) and group B-Allopathic dentifrice-Sensodent K (Warren pharma). Each gram of Hi Ora K dentifrice contained 2.5 mg *Cinnamomum zeylanicum*, 2.5 mg *Syzygium aromaticum*, 10.0 mg *Spinacia oleracea*, 6.0 mg Triphala, 4.0 mg Trikatu and 30.0 mg Suryakshara (Potassium nitrate) and 10.0 mg Yashada bhasma (zinc oxide), sodium benzoate, calcium carbonate with sorbitol, glycerine and xanthan gum. Each gram of Sensodent-K contains 5% of potassium nitrate. Plaque index and gingival index were recorded and hypersensitivity response to air stimuli using air jet from triple syringe & thermal stimuli using cold water was evaluated on the VAS, at baseline. After recording sensitivity scores and plaque index and gingival index scores at baseline, subjects were randomly given dentifrice and advised to use it with a soft bristle toothbrush twice daily for 3 weeks. Patients were recalled after 1 week and 4 weeks for clinical assessment.

Statistical analysis:-

Statistical analysis was carried out using Mann Whitney u test and Friedman test to compare two individual independent groups at baseline, 1 week and 4 weeks. Wilcoxon sign rank test was used as post hoc test for intergroup comparison.

Results:-**Table I-** Percentage change in mean sensitivity scores for two groups at all time points for both measures of plaque scores, gingivitis scores and sensitivity score

Groups	Clinical assessment	Change in mean sensitivity score (%)		
		Baseline to 1week	Baseline to 4 week	1 to 4weeks
Group-A	Plaque scores	-88.63 ± 42.9	-139.26 ± 69.3	-51.9± 65.5
	Gingival scores	-97.93 ± 41.9	-174.33 ± 58.56	-76.4 ± 44.3
	Thermal stimulus	-100.2 ± 49.8	-267.2 ± 82.4	-167 ± 66.18
	Air stimulus	-111.2 ± 32.4	-255.8 ± 59.2	-144.6 ± 54.8
Group-B	Plaque scores	-78.16 ± 34.02	-130.1 ± 54.3	-50.63 ± 78.5
	Gingival scores	-83.26 ± 51.05	-147.73 ± 56.6	-88.73 ± 42.03
	Thermal stimulus	-115.53 ± 46.43	-231.81 ± 56.76	-116.26 ± 40
	Air stimulus	-118.2 ± 55.70	-229.13 ± 65.54	-110.9 ± 34.2

Table II:- Comparison of two groups of percentage change in plaque, gingivitis, air and thermal sensitivity scores.

		Baseline to 1 week	Baseline to 4 weeks	1 week to 4 weeks
Plaque scores	t value	0.740	0.402	-0.050

	P value	0.677	0.252	0.05*

*Statistically significant

Discussion:-

HiOra K dentifrice contains *Cinnamomum zeylanicum* that has been found to have bactericidal properties and is found to be equally effective against both Gram-positive and Gram-negative organisms. Cinnamaldehyde, the predominant active compound in cinnamon oil, has been found to be a natural antioxidant.¹³ Extract of *Syzygium aromaticum* (clove) has been found to exhibit growth-inhibitory activity against Gram-negative anaerobic periodontal oral pathogens, including *Porphyromonas gingivalis* and *Prevotella intermedia*.¹⁴ Triphala has been found to have similar effects on dental plaque and gingival inflammation compared to chlorhexidine.¹⁵ Trikatu has anti-inflammatory properties.¹⁶ Yashada bhasma contains zinc and has been formulated into oral health products to control plaque, reduce malodor and inhibit calculus formation.^{17,18}

In the present study dentinal hypersensitivity was reduced in allopathic dentifrice group during 7 days assessment whereas after 30 days herbal dentifrice group showed significant reduction in dentinal hypersensitivity. This means that desensitizing affect was maintained even 7 days after discontinuing the product in herbal dentifrice group, this might be due to the component *Spinacia oleracea* present in HiOra K group. *Spinacia oleracea* may have a possible mechanism of having a synergistic effect along with potassium nitrate in reducing DH by its dentinal tubule obliterating property, as *Spinacia oleracea* was absent in the group B there was not statistical difference at 30 days. It has been found that potassium nitrate does not diminish dentine hydraulic conductivity, or promote obstruction of dentinal tubules by the deposition of crystals. According to Wilchgers¹⁹ and Ermer²⁰ potassium nitrate has an effective desensitizing action. The increase in the concentration of extracellular potassium around the nerve fibers causes their depolarization, avoids repolarization and blocks the axonic action and passage of nerve stimulus, thus inactivating the action potential.^{19, 20} Hence it was shown that group B which contains 5 % of potassium nitrate showed rapid relief in hypersensitivity during 7th day of assessment. In another study which compared HiOra K with that of placebo, Sensitivity scores for controlled air stimulus and cold water were recorded at baseline, 6 weeks and 12 weeks and concluded that test group was found to be significantly better compared to the placebo group at the end of 6 and 12 weeks in reduction of dentinal hypersensitivity.²¹

As per our knowledge this is the first study which also compared the effectiveness of desensitizing agents on plaque and gingivitis and it has been shown that there was no statistical significant difference between both the groups, but HiOra K showed better results in gingival index scores and plaque index scores which might be due to the presence of triphala which has effect on dental plaque and gingival inflammation.

Conclusion:-

Allopathic dentifrices had shown significant reduction in dentinal hypersensitivity at 7 days but herbal dentifrice had shown better results at 1 month follow up, which may be due to presence of *Spinacia oleracea*. Effect of antiplaque and gingivitis was also shown better results in herbal dentifrice group. Therefore according to our study, allopathic dentifrices is fast acting whereas herbal dentifrice has long term effect and has better antiplaque and antigingivitis effect compared to allopathic dentifrice.

Abstract

The researcher aims to assess the effect of selected antenatal exercises on outcome of labour among primigravida mothers. It was observed that most of the caesarean section and assisted deliveries occurred due to rigid cervix, prolonged labour and inability of the mother to cope up with the labour process and that affects both maternal and fetal outcome and further inquiry showed that the antenatal mothers lacked even basic knowledge about the importance of antenatal exercises. So it was concluded that there is association between antenatal exercises and labour outcome.

Introduction:-

According to Global Health Observatory data given by World Health Organization, every day in 2015, about 830 women died due to complications of pregnancy and child birth. The risk of a woman in a developing country dying from a maternal-related cause during her lifetime is about 33 times higher compared to a woman living in a developed country.¹

According to UNICEF, globally about 800 women die every day of preventable causes related to pregnancy and childbirth, 20% of these women are from India. Annually, it is estimated that 55,000 women die due to preventable pregnancy related causes in India.²

To study the same, the researcher reviewed many literature and it was obtained through various database includes CINHALL (Cumulative index TO Nursing & Allied Health Literature), MEDLINE (Medical Literature Analysis & Retrieval System Online), PubMed, Science Direct, SpringerLink, ProQuest & Google scholar.

Material Methods & Findings:-

The study is headed mainly on the effect of antenatal exercises on outcome of labour among primigravida mothers attending maternity services.

A RCT was done to examine the efficacy of antenatal exercises on maternal and neonatal outcomes in elderly primigravida at the Physical Therapy Department of Bolak Abu-Ela General Hospital, Cairo, Egypt in 2013-14. 60 elderly primigravida at 14 weeks' gestation within the age range of 35-40 years were divided randomly into equal experimental and control group. Present Pain Intensity scale, partograph and APGAR score were the main tools of data collection. Participants of experimental group showed a statistically significant difference in the intensity of labor pain when cervical dilatation was between 7 and 8 cm ($P = 0.000$), duration of first stage of labor ($P = 0.026$),

Corresponding Author:- Jalpa Prajapati.

Address:- Manikaka Topawala Institute of Nursing –A constituent of Charotar University of science and Technology, Changa, Ta.Petlad, Dist.–Anand, Gujarat-388421.India.

and neonates' APGAR scores at the first and the fifth minute of life ($P = 0.000$) compared with participants of control group. The study concluded that antenatal exercises are very effective in decreasing adverse effects and labor complications in elderly primigravida and their neonates.³

A cross-sectional study was conducted to find out effectiveness of antenatal exercise in facilitating normal labor and also other benefits associated with antenatal exercise during pregnancy in antenatal exercise facility of private clinic and government institution of Indore district in 2013-14. 200 females of age group of 20- 35 years who had recently delivered and did not have any medical/surgical/obstetric complications were selected through sequential sampling technique and equally divided in experimental and control group. A semi structured questionnaire was used as study tool for interview. The data was analyzed using appropriate statistical software (MS excel and SPSS version 20). Chi square test was applied for significance association between variable. The study showed that only 36% of control group females were delivered normally, as compared to 74% experimental group females. In experimental group only 9% females had urinary incontinence after delivery. Main reason for not doing antenatal exercise was not having enough time (42%) followed by not having enough knowledge (31%). Only 30% females of experimental group had the problem of backache, as compared to 63% control group females who suffered from same problem. ($X^2=21.887$, $p=0.001$, $RR=0.493$, $CI\ 0.356-0.683$). Thus the study concluded that females practiced antenatal exercise had less chances of caesarean section, back ache and urinary incontinence.⁴

A quasi-experimental control study was conducted to assess the effect of pelvic floor muscle exercise training protocol for pregnant woman during 3rd trimester on labor duration at El-Manial University Hospital, Cairo University, Egypt in 2013-14. 100 pregnant women were recruited by convenient sampling technique and equally divided in to experimental and control group. Experimental group received pelvic floor muscle training exercise whereas control group received only standard routine care. Structured interviewing tools, pelvic floor muscles strength assessment, antenatal follow up checklist, partograph were used as tools of data collection. The study showed that there was a highly significant statistical difference between the study and control groups in relation to duration of 1st, 2nd and 3rd stage of labor. There was a high statistically significant difference found for the mean cervical dilatation and effacement among the two groups. The study also showed that mothers in the study group had better labour progress than those in the control group. Thus the study concluded that pelvic floor muscle training exercise can be useful to decrease duration of labor.⁵

A cross-sectional study to analyze the knowledge, attitude and practice of exercise during pregnancy among antenatal mothers was conducted at Indira Gandhi Medical College and Research Institute, Puducherry, India in 2015. A total of 200 antenatal mothers who aged between 18-35 years were included in the study. Data were collected using a self-administered pretested close ended questionnaire. Data were analyzed using Statistical Package for Social Sciences (SPSS). The study showed that total mean knowledge score was 20.53 ± 2.08 . 51% felt it was necessary to do exercise during pregnancy. Only 18% were practicing exercise in pregnancy. The study concluded that the knowledge of women on exercise during pregnancy was less than average, and their attitude was favorable. However a very few were actually practicing exercises in pregnancy.⁶

A quasi-experimental study to assess the effect of antenatal exercises on labour outcome among primigravida mothers was conducted at Seethalakshmi Corporation Maternity Centre for experimental group and CTM Centre for control group in 2009-10. Simple random sampling technique was used to select 300 low risk primigravida mothers who were equally divided in each experimental and control group. Observation tools used for labour process included: Observation record on progress of labour (Partograph), Intrapartum variable proforma, Numerical Pain scale, Primigravida's behavioral responses during labour, neonatal variable proforma (APGAR score & presence of birth injuries). The overall mean knowledge score for control group was 5.37 ± 1.21 whereas in experimental group it was 25.11 ± 0.92 . There was a significant statistical difference found between control and experimental group in all the areas of knowledge on antenatal exercise among primigravid mothers ($t = 173.04$, $p<0.001$ level). Comparison of antenatal exercises on labour process showed that 10 (14%) had poor outcome, 46 (62%) had fair outcome and 18 (24%) had good outcome in control group whereas in experimental group 16 (17%) had fair outcome and 79 (83%) had good outcome. The overall mean value for control and experimental group was 12.45 ± 2.51 and 16.42 ± 1.698 respectively and the obtained 't' value is 12.33. at $p<0.001$ level, so there was a significant difference in the outcome of labour process among control & experimental group. The study was concluded that the regular practice of antenatal exercises along with knowledge had enhanced the labour process with good labour outcome which can be adopted by the nurses in their clinical practice.⁷

A descriptive study to assess the knowledge of primigravida mothers regarding antenatal care was conducted at Kadusonnaphalli PHC for rural and Narayanapuram PHC for urban area in 2014. 100 primigravida mothers were selected using convenient sampling technique which was from rural and urban areas. Self prepared a structured interview questionnaire was used for data collection. Majority of 82% primigravida mothers had inadequate knowledge and 18% had moderately adequate knowledge in rural area. In urban area 54% had moderately adequate knowledge and only 10% had adequate knowledge of antenatal care. There was no significant association found between knowledge of primigravida mothers with selected demographic variable. The overall aspects mean knowledge score was 40% with standard deviation 12.78 in rural and in urban 51.90% with standard deviation 14.14. Highest mean knowledge score was found on general information 48% in rural and 61.50% in urban regarding antenatal care. Thus the study concluded that more stress should be given to increase the knowledge of primigravida mothers regarding antenatal care.⁸

A randomized controlled trial was conducted to evaluate the effect of antenatal exercises on pulmonary functions and labour outcome in uncomplicated primigravida women at UCMS & GTB Hospital, Delhi, India in 2015. 122 uncomplicated primigravida in age group of 18-35 years at 24th - 28th week of gestation were randomly allocated into study and control groups. Baseline pulmonary function tests and parameters related to labour outcome were used as tools for data collection. Pulmonary function tests (PFTs) were done for all subjects at 24th week of gestation and after 36th week of gestation. A significant improvement in FEV1, FVC, FEF25-75%, MEF50%, MIF50% and MVV between 24 & 36 weeks was observed in the study group after exercises. In the study group 41.67% patients did not require augmentation compared to 22.95% in the control group. In study group 13.11% patients had meconium stained liquor which was significantly less in comparison to 41% patients in the control group. Mean duration of first, second and third stage of labour was shorter in study group than control group. In study group 96.72% had normal and none had instrumental vaginal delivery compared to 88.52% and 6.6% from control group respectively. Caesarean section rate was 3.3% in study group and 4.9% in control group. Fetal weight gain, birth weight, birth length and head circumference was significantly higher and NICU stay was significantly lesser in study group compared to control group. The study was concluded that antenatal exercises lead to improvement of pulmonary functions and hence labour and neonatal outcomes.⁹

A critical review of the literature examining the effect of exercise on maternal outcome was done in 2006. Literature reviews were done from PubMed (all available years), personal communications, and personal searches of files. Results indicated that exercise during pregnancy is safe and perhaps even reduces the risk of preeclampsia and gestational diabetes. The evidence for weight gain and labor and birth (rates of cesarean sections, duration of labor) was found to be mixed. Unfortunately, much of the researches examining exercise during pregnancy were observational, and the few randomized controlled trials that existed were small and inadequately powered. The study concluded that practitioners should encourage their healthy pregnant patients to exercise. Practical guidelines for recommending exercise to pregnant women were also presented.¹⁰

A quasi experimental study was conducted to evaluate the effectiveness of selected nursing measures on labour outcome among primigravid mothers at Nirmala Hospital, Suryapet in 2015. 40 primigravida mothers were selected using non – probability convenient sampling technique and equally divided into experimental and control group. A structured observational record sheet was used for assess labour outcome. This study revealed that there was high significant difference found in pain at $p < 0.001$ level between study and control group. The study concluded that, clinical implementation of nursing measures usage during antenatal period could be an effective non pharmacological intervention in improving labour outcome.¹¹

A quasi-experimental, clinical trial study aimed to determine the effect of participating in the labor preparation classes on vitality and positive affect during pregnancy and in postpartum period in the pregnant women referred to the Isfahan public health centers was done in 2010. 120 eligible pregnant women since 20 weeks of pregnancy who referred to these centers were selected simply and randomized in two groups (60 in the case and 60 in the control group). Questionnaires of vitality and positive affect toward the labor were used for data collection. There was a significant difference in vitality and positive affect regarding type of delivery before and after intervention and after delivery in case group ($p < 0.0001$). There was no significant difference in vitality and positive affect scores after delivery and after intervention ($p < 0.083$, $p < 0.545$). There was significant difference in vitality and positive affect scores between case and control groups after the intervention and after the delivery ($p < 0.001$, $p < 0.0001$). This study concluded that it could be recommended that all pregnant women should contribute in delivery preparation classes to improve their mood, confidence, vitality toward labor.¹²

Conclusion:-

Various searched studies suggest that there is association between antenatal exercises and labour outcome. Hence, Researcher is interested to assess the effectiveness of antenatal exercises on labour outcome among primi gravid mothers attending maternity services.

Opinion Dynamics, Consensus, Majority Rule, confidence, agent base simulations

Abstract

A new opinion dynamics model in which the individuals are identified by two variables, namely parameterized with their binary opinion and confidence levels is introduced. In this model the exchange of opinions are realized through pair wise interactions. The dynamics is governed by the pressure of the neighboring sites and personal convictions of the individuals living on a regular lattice. The model successfully to describe opinion exchange mechanisms of the societies where individuals with various levels of confidence exchange opinion through pair wise interactions under the influence of nearest neighbors.

Introduction:-

Societies consist of individuals who try to optimize their welfare. Each individual make some local changes with an expectation to improve its welfare state which leads to underlying dynamics of the global changes of the whole society. In this sense social systems and physical systems, such as spins systems, exhibit close similarities: Both want to optimize their statue in the system. These similarities are basic motivation for using statistical physics in many situations that occur in social systems. In applying statistical physics to the social systems the essential assumption is that, the individual preferences do not play crucial role in the global changes of the societies. Simulation techniques play an important role in statistics which are successfully applied in various areas of the social sciences. Rumour propagation, epidemics, opinion dynamics are the major areas of social sciences that simulation techniques have been applied with considerable success [1].

To modeling social systems, it is necessary to quantify the outcome of the individual behavior of the by suitable variables. These variables can take continuous or discrete values. Together with determining the variables, also the local the interactions between the individuals must be formulated. Basic difference between the physical systems and the social systems appear at this point. In physical systems the constituents have well defined interaction rules based on the energy minimization, while for the social systems different rules for dynamics are proposed for the evolution of the system. These rules are based on which behavior of the individual is observed.

One of the major issues in simulation studies of the social behavior is how opinions evolve in a social system, namely opinion dynamics. In opinion dynamics variables are opinions of the individuals which may take continuous [2]-[4] or discrete [5]-[6] values. Starting from randomly distributed initial opinions, dynamics may leads to consensus or fraction. Consensus is unanimously agreement on one of the opinions. While fraction is more than one opinion are supported by various group of the society. In magnetic systems all spins can be aligned (consensus) or sum of the spins may point one direction while the others point opposite (fraction).

There exist a great number of opinion dynamics models which describe the formation of opinions in a social system. Schelling model [7] is known as the first one of the simulation model. Since then various models and their modifications are improved [8]. Some of these models introduce detailed opinion exchange mechanisms such as bounded confidence model [9] and they are applied to various social events successfully [10]-[12]. Bounded confidence model assumes continuous opinion and pair wise interaction. In this model the interacting individual may change opinion only if two interacting individuals have opinion differences less than a threshold value. In Hegselmann and Krause [13] model a randomly selected individuals accepts an average opinion of the neighbors which is different from his opinion by a confidence parameter ε . Some others take simple opinion exchange rules. In these simple models exchange of opinions can simply be accepting opinion of randomly chosen neighbor [10]-[12] or the individual may be influence by its neighbors and take the opinion of majority [14]-[15]. Sznajd model among these simple models is an exception. This model assumes that every individual try to influence its neighbors. If two neighbors share the same opinion neighbors of the pair accept their opinion.

As a sociological fact, opinion formation is strongly related to social pressure and confidence among many other effects. Some people easily accept the opinion of the neighbors while some others are reluctant to accept opinions coming from the others. Hence, even simple model of opinion formation requires taking into consideration social pressure on the individuals. The majority rule, in which agents agree with the local majority opinion at every time step is widely used in opinion dynamics studies [17]-[18]. This type of behaviour called herding behaviour, it is assumed that the minority definitely follows the majority. It is obvious that together with the effects of the neighbors, some personal merits plays important role in persuasion process.

Recently a variation the bounded confidence model has been introduced [19]. In this model agents are placed at the vertices of a regular lattice. Interactions are possible within a certain range the agents to interact with those which are located beyond their first neighbors. Each agent is identified by two parameters, its opinion and degree of conviction. The degree of conviction of an agent is affected during the interaction. If the interaction is with a neighbors of higher conviction, the agent lose some of his/her conviction. If the opponent has lower conviction in the light of the above discussion gain conviction. When one of the agents reaches a certain lower bound of conviction then its opinion changes to that of the opponent. Therefore, in this work, the difficulty in persuading someone who has a strong conviction was taken into consideration.

In this work, a new model which aims to study the relation between the social pressure and the confidence is proposed. In this model the individuals interact only with their nearest neighbors and it is assumed that they may exchange opinion through pair wise interactions. The model is essentially a variation of the majority rule model: two randomly selected individuals exchange opinion under the pressure of the neighboring sites and their own personal convictions which is added to the model as a new parameter for each individual. If an individual interact with one of its neighbors, a) may convince the neighbor to change opinion, b) may change its opinion. If an individual is in local agreement with its surrounding neighbors and have high confidence may hardly change opinion. In this model a function which measures the satisfaction level of the individuals is introduced. This function sets numerical value for the local agreement with the surrounding neighbors and the confidence of the individual living at site i . When two neighbors exchange opinion the relative values of their satisfaction functions play the decisive role and exchanging opinion can be realized according to the rules give in Section II.

The main aim of this study is to determine the role of confidence of the individuals and the pressure created by the neighboring agents in opinion exchange mechanisms. This work differs from the existing literature by the opinion exchange dynamics.

This work is organized as follows. Section II is devoted to a detailed description of the model. The results and discussions on the results are presented in Section III whereas concluding remarks are drawn at Section IV.

Computer Simulation Model:-

The society consists of N interacting individuals living on a regular 2-dimensional lattice with only nearest neighbor interactions. The dynamics of the opinion exchange is assumed to take place through discrete time steps. The agents are identified by two parameters: their opinion and confidence level. Opinion can only take discrete values while the confidences of individuals are parameterized by real numbers.

Agents possess binary opinions: ± 1 for supporting and for opposition the proposition. Initially, the opinions are set randomly ± 1 with probabilities p and $q = 1 - p$. The confidence parameters are set according to the initial distribution of the opinion of the individuals. In this work, all individuals may carry i) the same confidence level, ii) two different confidence levels for $+1$ and -1 opinion holders, iii) randomly distributed confidence levels for each individual. Since both, confidence levels and the opinions depend on the probability, p is a crucial control parameters of the simulation. During this work the probability is kept as $p = 1/2$.

Opinion dynamics models such as Sznajd Model [19] assume interaction between the agents sharing the same opinion. When such a pair interacts, they influence all of their nearest neighbors. The Sznajd model is an exception in this sense. There exist also some other models where the majority opinion is the decisive factor for changing opinion. The proposed model is based on mutual interaction of pair of individuals occupying two neighboring sites. In this sense, the interaction type is similar to Sznajd model with the difference that the Sznajd model considers only two sites with the same opinion whereas in this model pairs can carry any opinion. The selected pair can influence each other according to their level of satisfaction. In such a societies satisfaction can be described as the level of cooperation with the neighbors: if the majority of the neighbors share the same opinion the individual feels comfortable and satisfied with its position. The satisfaction, in this model, has another component: the confidence. An individual with high confidence level feels satisfied even when some neighbors are not in accord. If the majority of the neighbors carry the opposite opinion then this individual either have to change its opinion to reduce the pressure exerted by the neighbors or has to move to another place. This is common in physical systems where under pressure constituents of the system change state to reduce their energy or exerted pressure. Hence in a society, satisfied members are the highly confident individuals which feel comfortable in interactions with the like individuals.

The satisfaction of the individual living at site i can be formulated as,

$$E_i = O_i * \left[\sum_{j \in NN} O_j + C_i \right] \quad (1)$$

where E_i , O_i and C_i are the satisfaction, opinion and the confidence parameters of the individual living at site i . j and O_j indicate the location and opinion of the neighboring sites.

The model is based on interaction of two neighboring individuals. One of the individual may convert the other through their mutual interaction. This interaction and the opinion changing mechanism depends on the satisfaction parameters of the individuals.

As far as the satisfaction parameters are concerned three different cases must be considered.

1. Both neighbors are unsatisfied
 $E_i < 0, E_j < 0$.
2. Either one of the neighbors is satisfied while the other is unsatisfied
 $E_i < 0, E_j > 0$ or $E_i > 0, E_j < 0$.
3. Both neighbors are satisfied
 $E_i > 0, E_j > 0$.

These three cases can be used to formulate the local dynamic of the opinion changing mechanism.

1. Case 1: if both parties are unsatisfied, changing opinion for both will create satisfied individuals. Hence in this situation both interacting individuals change opinion.

$$E_i < 0, E_j < 0 \Rightarrow O_i = O_j = O_i.$$

2. Case 2: In the case one of the neighbors are unsatisfied while the other is satisfied.

$$E_i < 0, E_j > 0 \Rightarrow O_i = O_j = O_j.$$

$$E_i > 0, E_j < 0 \Rightarrow O_j = O_i = O_i.$$

Unsatisfied individual of the pair will accept opinion of the other.

3. Case 3: If both neighbors are satisfied, $E_i > 0$ $E_j > 0$, and they both share the same opinion. Opinion change is not possible. But if the opinions are different, $O_i \neq O_j$ relative satisfaction determines which one of the interacting neighbors will change opinion:

$$\begin{aligned} E_i < E_j \quad O_i &= O_j \quad O_j = O_j \\ E_i > E_j \quad O_j &= O_i \quad O_i = O_i \end{aligned}$$

Here in this opinion updating process opinion changes are realized according to the satisfaction level of the individuals.

These updating rules are the local opinion exchange moves. After setting the opinion distribution and confidence levels, the observation of the dynamic changes of the opinions of the individuals or the society as the whole constitute the basic steps of the simulation.

A configuration is considered as a snapshot of the society at a given time t . Initial configuration is the distribution of opinions at the time t_0 , the beginning of the debate. Debate continues with pair wise interactions of the individuals until the society reaches the final distribution of opinions. Reaching this final state takes some time. The final state can be a consensus or polarization. In order to observe the final state of the society it is best to analyze the configuration average of the opinions distributed in the society at any given time t . Configuration average is calculated as follows,

$$\bar{O}(t) = \frac{1}{N} \sum_{i=1}^N O_i(t) \quad (2)$$

Where $O_i(t)$ and $\bar{O}(t)$ are the number of individuals, the opinion of the i^{th} individual at time and $\bar{O}(t)$ is the configuration average of the opinion held by the society respectively. $\bar{O}(t) = \pm 1$ indicate consensus on one or the other opinion.

Since the initial configuration is an arbitrary distribution of opinions with a given fixed value of probabilities p and q , one must take average over many statistically independent configurations. The number of statistically independent configurations are $N_{samples}$. The simulation should be repeated and averages must be taken over the statistically independent configurations.

$$\langle \bar{O} \rangle(t) = \frac{1}{N_{samples}} \sum_{i=1}^{N_{samples}} \bar{O}_i(t) \quad (3)$$

Given any starting configuration the dynamics determined by the defined interactions change the average opinion held by the society to the most stable configuration. This process requires the transition time, $t_{Transition}$. After this transition period the society reaches a final state which may fluctuate around an average value or reaches to consensus over one of the states. The time duration from a given initial state, to the state where stationary state are observed $t_{max} \gg t_{Transition}$ varies with the values of free parameters and the interactions between the individuals. For a given set of parameters, configuration averages calculated at t_{max} fluctuate around an average $\langle O \rangle$.

$$\langle \bar{O} \rangle = \frac{1}{N_{sample}} \sum_{i=1}^{N_{samples}} \bar{O}_i(t_{max}) \quad (4)$$

where, N_{sample} is the number of different statistically independent initial configurations which contribute to the average.

If both opinions live together, the average opinion represents the opinion of the society. In some cases, in the long term, the societies end up with consensus on one or the other opinion. Depending on the initial configuration either one of the opinions can win. In the case of equal distribution of opinions consensus may be reached on one or the other opinion values. Hence, taking the average gives misleading result. Together with the average one also must check whether this average is truly representing the opinion of the society. Best method is to calculate the distribution of the configuration averages. If distribution is normalized to the number of configurations one can obtain the percentages of the configurations which end with consensus on the pro or con opinions.

Results:-

The simulations are performed on (50×50) square lattice. Initial configurations are prepared by setting two parameters which identify the opinion and confidence level of each individual. A configuration is created by filling the sites randomly with opinion values ∓ 1 with equal probability. Confidence parameters are set according to two scenarios: i) All individuals have fixed confidence values, ii) Supporters of one of the opinion have higher confidence level. After preparing the initial configuration the time development of the opinion change of the society is observed for 10000 discrete time steps. During the simulation a new configuration is created by updating randomly chosen lattice sites. Updating each site is repeated volume times (50×50) . Since pairwise interactions are considered, this updating procedure corresponds to approximately updating each lattice site twice. Averages are calculated over 500 statistically independent configurations.

During the simulations, opinion averages are calculated by taking the configuration averages, Eq. (2) at each time step. The average of the configuration averages are calculated for each time slice over the 500 statistically independent runs, Eq. (3). The configuration averages are also used to calculate configuration distribution at every time step. Distributions are very illuminating since opinion averages may be misleading for the situations where consensus may be reached on either one of the opinions.

Fig. 1 shows the time evolution of the average opinion formation for various confidence parameters. From bottom to top, first two curves corresponds to equal confidence parameter values which are $C_1 = C_2 = 0$ and $C_1 = C_2 = 0.1$. For the case where vanishing confidence parameter is considered, all configurations exhibit very low average opinion value. This is an indication that in an equally divided society, with individuals ready to change opinion under any pressure, both opinions will always survive. Even small confidence parameters change this situation. In the case where supporters of both opinions have equal, small confidences, an immediate change in the behavior appears. This changing behavior can be summarized in two stages. The first stage corresponds to a very rapid opinion changing regime. After this rapid change the system gets into a more stable phase where more and more individuals share the same opinion. The effect of the unbalanced confidences is shown in top curve. Considering supporters of either one of the pinions with slightly larger confidence, $C_1 = 0.1$, $C_2 = 0.2$ change the picture completely. The initial rapid opinion changes are much faster in this case. System reaches consensus after a very rapid persuasion process.

Fig. 1:- Time evolution of the average opinion of an initially equally divided society.

Fig. 2-5 show the time evolution of the distribution of configuration averages of the opinion formation. Each figure exhibits the effects of a different set of confidence parameter. In Fig. 2 vanishing confidence level is considered for supporters of either one of the opinions. As it is seen from the time development of average opinion formation Fig. 1 the distribution also exhibit that with vanishing confidence, individuals change opinion under the influence of

neighbors only. This influence is a random effect. Hence the configuration averages are distributed around the vanishing average value.

Fig. 2:- Distribution of average opinion for a society with vanishing confidence $C_1 = 0, C_2 = 0$.

Fig. 3, also shows a similar behavior to that of Fig. 2: distributions are centered around the vanishing average opinion value. Similarity between the Fig. 2 and Fig. 3 ends here. The reason of having distributions centered around vanishing average opinion value, in this case is, very different. The strong confidence does not allow the individuals to change opinion under the influence of the neighbors. Since the original initial configuration consist of equal number of both pro and con individuals, configuration average remains very small under the influence of the high and equal confidence levels.

Fig. 3:- Distribution of average opinion for a society with high and equal confidence $C_1 = 2.0, C_2 = 2.0$.

Fig. 4 shows time development of the distribution of configuration average of opinions. Here both opinions are supported by the individuals with non-vanishing and equal confidence. Supporters of both opinions try to persuade the individuals with opposite opinion. Depending on the initial configurations, one or the other opinion succeed to reach consensus. The peaks at the extreme ends, $\langle \bar{O} \rangle = \pm 1$ indicate that consensus is reached considerable times. In the case where both parties have equal confidence, it is almost impossible to predict which initial configurations will lead to consensus. There are also many configurations with average opinion values lies in between -1 and $+1$ which give a distribution around 0. This behavior can be better understood by comparing the Fig. 1 and Fig. 4.

Fig. 4:- Distribution of average opinion for a society with non-vanishing and equal confidence $C_1 = 0.1, C_2 = 0.1$

This situation completely different when even a small difference appear in confidences. Fig. 5 is devoted to the discussions of the effects of difference in the consensus parameter. Individuals with strong confidence are difficult to persuade. Moreover they have advantage that they are more satisfied in their local environment.

Fig. 5:-Distribution of average opinion for a society with high and equal confidence $C_1 = 2.0, C_2 = 2.0$

This high satisfaction enables them to persuade the opponents in interactions. This is clearly seen in Fig. 1, and Fig. 3. In Fig. 5 distribution of the configuration averaged opinion values peak around zero at the initial state of the simulation. But immediately after few hundred iterations every configuration ends with consensus on the opinion which is supported by high confidence supporters. Here in this simulation work the consensus is reached on the opinion with the value -1 , whose supporters carry confidence level of 0.2 .

Conclusions:-

The proposed model is a simple, deterministic model of opinion formation with confidence parameter which is similar to the external field in the physical systems. In this simple form, the model is capable of predicting the conditions for partition or consensus. Numerical results give the indication that even a small non vanishing confidence parameter is essential for reaching consensus. If supporters of both opinions have equal confidence, the consensus is just coincidental.

The model in this simple form can be considered as a laboratory to discuss the decision making mechanisms. Moreover it is open to extensions. The simple extension can be that the confidences may change in time with pairwise interactions.

Abstract

This paper tries to find out the implications of trade liberalization on international trade tax revenues and its macroeconomic implication on Pakistan economy. The theoretical approach of trade reforms and its impact on the direction of change of revenue is ambiguous because of its dependence on the productivity of 'trade tax revenues'. By using the data of twenty five years, the paper first establishes the productivity of 'trade tax revenues' in Pakistan, then by an econometric analysis exploration of the relationship between trade revenues and trade liberalization in Pakistan is done. It was observed through our analysis that there is high productivity of trade tax revenues, further, our results show a positive and significant relationship between trade liberalization and collection of trade tax revenue. To support this relationship, a second test of Granger's causality is also performed which confirm the causal relationship between trade tax revenues and trade liberalization. It was suggested that supportive macroeconomic policies are prerequisite for successful trade liberalization.

Plus que la plupart des participants au monde anthropologique, Michel Leiris échappe à la définition des catégories traditionnelles de l'activité intellectuelle. Avec un pied dans Anthropologie et littérature, sa vie a également été centrée sur des relations personnelles étroites avec un réseau diversifié d'artistes et de penseurs créateurs, de Picasso à Sartre. Dans le domaine de l'anthropologie, tant sa reconnaissance de l'importance de l'ethnologue, la subjectivité et sa fascination pour les situations sociales et culturelles «hybrides» (particulièrement en milieu colonial) placent son œuvre en 1930 un demi-siècle en avance de son temps. Son vrai nom était **Julien Michel Leiris**, il est né le 20 avril 1901 à Paris et il est décédé le 30 septembre 1990 à Saint-Hilaire, Essonne, France. Il était un écrivain surréaliste et aussi un ethnographe.

Michel Leiris, en 1931, prit la fuite pour l'Afrique, un homme frustré souffrant de phobies sexuelles, d'inhibitions écrivains et d'un penchant pour l'abus d'alcool (Roudinesco 1992: 45-48). Suivant les conseils de son ami Georges Bataille, Leiris a commencé la psychanalyse en 1929 pour ces problèmes interdépendants qu'il a dû interrompre pour entreprendre son voyage à travers le continent africain. Avec le consentement de son analyste, Leiris accepte l'invitation à se joindre à la mission Dakar-Djibouti en tant qu'archiviste et secrétaire, ce qui l'éloignera de sa vie à Paris pendant une bonne partie de deux ans. Il n'est donc pas surprenant que les notes de terrain du jeune auteur reflètent sa santé mentale fragile où les obsessions personnelles, l'auto-reproche, et l'âme angoissante l'accompagnent de village en village et même sur le bateau de retour à la maison. Cette information biographique, considérée dans ses contextes historiques et culturels, jette une lumière précieuse sur L'Afrique fantôme de Leiris à

cause de son filtre remarquablement subjectif en tant qu'observateur d'Afrique (Leiris 1981). En fait, le lecteur apprend autant, sinon plus, sur le monde intérieur de Leiris dans *L'Afrique fantôme* que sur les peuples et les cultures de l'Afrique qu'il a rencontrés le long du chemin. Même dans les circonstances ordinaires, la localisation de l'écrivain comme sujet de cette manière est utile à l'étude de la littérature de voyage et de l'ethnographie comme discipline, mais cette approche prend de plus en plus d'importance avec *L'Afrique fantôme*, étant donné l'état d'esprit troublé et la mission personnelle de l'auteur : Leiris est allé en Afrique à la recherche d'une nouvelle peau. Ses attentes culturelles de l'Afrique ont tenu l'espoir pour sa propre transformation personnelle en se reconnectant avec l'enfant sauvage à l'intérieur.

Bien que n'étant plus officiellement membre du groupe surréaliste lorsqu'il est parti pour l'Afrique, des traces de la participation de Leiris à cette expérience révolutionnaire sont présentes tout au long de son journal de voyage. Parmi tous ceux qui ont participé au surréalisme français, Michel Leiris fournit le meilleur exemple de la manière dont son milieu intellectuel d'avant-garde à Paris a combiné une fascination africaniste avec des notions de protestation politique. Dans cet esprit, je vais explorer à la fois les limites épistémologiques et institutionnelles de l'engagement de Leiris avec l'Afrique dans *L'Afrique fantôme*. L'attention portée à l'épistémologie de Leiris se focalisera sur sa perception de lui-même, de l'Afrique et des autres ethnographes de l'équipe avec lui par rapport aux constructions dominantes de «l'Afrique» avec des catégories «primitives» et «civilisées» - l'opposition structurant le primitivisme d'avant-garde. La description de Leiris de leur travail en tant qu'ethnographes (Collection d'objets, utilisation de traducteurs) et la justification de leurs actions fournit des preuves troublantes de la relation problématique de sa génération avec l'Afrique. Le rôle de l'archiviste et secrétaire de la mission Dakar-Djibouti, première expédition ethnographique française en Afrique, l'a placé dans une position privilégiée pour enregistrer à la fois les domaines où il et sa cohorte ouvrent de nouveaux horizons ainsi que les lacunes de leurs pratiques.

En raison de la nature collective de cette mission ethnographique, il sera utile de considérer la dimension institutionnelle de l'engagement de ces Français avec l'Afrique en plus des concepts et des catégories organisant le discours de l'auteur. Leiris fait partie d'une équipe d'ethnographes, dirigée par Marcel Griaule, qui a traversé le continent africain d'ouest en est, commençant à Dakar à l'automne 1931 et finissant à Djibouti au printemps 1933. Bien que l'inspiration pour l'expédition ait été multiforme, l'entreprise était avant tout une entreprise de collecte de musées financée en partie par le gouvernement français. Au cours de l'année et demie du groupe passé en Afrique, ils ont rassemblé plus de 3500 œuvres d'art et artefacts qui sont maintenant logés au Musée de l'Homme. La manière dont la Mission Dakar-Djibouti, en tant qu'initiative institutionnelle parrainée par l'Etat, structurerait et circonscrirait les actions des participants sera considérée comme faisant partie d'un processus collectif d'incorporation d'informations sur les colonies comme moyen de faire face aux impériales expansions. Ces deux dimensions de *L'Afrique fantôme* - l'épistémologique et l'institutionnel - mettent en évidence la nature paradoxale du rejet de Leiris de la culture française bourgeoise en fuyant en Afrique en quête d'un nouveau moi tout en restant redevables à sa nation et à sa classe, La préservation de leurs intérêts.

Il y a une longue tradition d'écrivains français qui se préparent à échapper à la fatigue de leurs occupations intellectuelles à Paris; Deux prédécesseurs mentionnés par Leiris sont Arthur Rimbaud et André Gide. Le cas de Rimbaud est le plus extrême des deux: il abandonne entièrement la poésie d'écriture et se met à la voile pour l'Afrique, seulement pour revenir des années plus tard sur une civière avec des histoires sauvages à raconter (Nicholl 1997). Pour Gide, c'est juste après avoir terminé *Les Faux-monnayeurs* (1925) qu'il entreprend un long voyage à travers l'Afrique équatoriale française. À son retour, Gide publia ses journaux de voyage '*Voyage au Congo*' (1927) et '*Retour du Tchad*' (1928), qui vendit immédiatement des milliers d'exemplaires. Non seulement les impressions de Leiris sur l'expédition africaine de Gide l'accompagnent sur la route, Leiris nourrit les espoirs de rencontrer réellement Rimbaud en Afrique - la quintessence des rebelles devenus natifs. Le début de *L'Afrique fantôme* révèle l'état d'esprit initial de Leiris et comment le voyage a été entrepris avec le désir d'échapper à la monotonie de la vie métropolitaine.

"En somme, très peu de différence entre la vie du fonctionnaire à Paris et sa vie à la colonie (j'entends : dans les grands centres) ; il a chaud et il vit au soleil au lieu d'être enfermé ; en dehors de cela, même existence mesquine, même vulgarité, même monotonie, et même destruction systématique de la beauté. J'ai grand 'hâte d'être en brousse. Cafard" (Leiris 1981 : 28).

La quête de Leiris n'était pas seulement de découvrir l'Autre, mais de se trouver en Autre. Loin de ses devoirs conjugaux, de la société française et des querelles de la Centrale surréaliste, il trouve son chemin non pas vers un

être sauvage et sauvage, mais vers l'écriture. La distance dans cette équation était décisive, libératrice; Il a créé un sentiment de sécurité et de stimulation. Il a été confronté à une abondance continue d'informations à interpréter et sa tâche officielle était de prendre des notes. C'était une recette parfaite pour guérir le bloc de l'écrivain mais pas nécessairement celui qui ferait la carrière d'un écrivain. Leiris écrit *L'Afrique fantôme*, l'œuvre qui le rendait célèbre, sans aucune idée qu'il deviendrait un classique, alors que ses publications ultérieures - souvent le fruit d'un travail laborieux - n'avaient jamais obtenu la même reconnaissance. La combinaison de l'ethnographie et de l'autobiographie - une recherche de soi dans l'Autre - qu'il a trouvée lors de son premier voyage en Afrique est devenue un aspect durable de sa vie d'écrivain. Dès le début, le jeune poète fait des observations approfondies sur son environnement, ce qui prête une qualité d'écrivain aux notes de terrain de l'ethnographe en difficulté. Il n'épargne ni les Européens ni les indigènes son ironie humoristique rendue avec un usage habile de détails descriptifs:

“Allé le soir avec les B... et Griaule à *L'Oasis*, dansant nègre de Dakar. On y voit : des négresses — femmes ou amies de sous-officiers de tirailleurs — habillées à l'européenne ; des putains noires, métisses ou arabes ; quelques grosses négresses en costume local ; des pédérastes nègres qui dansent ensemble en petit veston cintré ; un pédéraste blanc à l'allure d'employé de bureau dansant, une fleur à la bouche, avec un marin nègre à pompon rouge ; deux sous-offs de la coloniale dansant en couple ; trois types de la marine marchande ou de la marine de transport, dont l'un (à casquette blanche à visière, petite moustache en fil, et cigare) a aussi merveilleuse allure que les plus beaux aventuriers des films américains“ (*ibid.*: 33).

Ce passage illustre le ton d'une grande partie de *L'Afrique fantôme*: sa qualité hybride combine la pratique noteuse de l'archiviste-secrétaire ("On y voit: ..."), une sensibilité littéraire à l'amoureux à la recherche de sensations fortes, comme Ainsi que l'œil d'un ethnographe pour documenter l'Autre. Le style conscient de Leiris, l'utilisation libérale des dates et des noms de lieux permettent au lecteur de situer le sujet narratif dans le temps, l'espace et la culture. En termes plus généraux, l'intersection entre autobiographie, ethnographie et vision surréaliste de la culture fait de *L'Afrique fantôme* un document particulièrement précieux de l'engagement de l'auteur dans les tendances culturelles qui ont façonné les valeurs et les perspectives de sa génération, notamment le primitivisme d'avant-garde.

Compte tenu de son âge et de son état d'esprit - Michel Leiris n'avait que trente ans quand il partit pour l'Afrique en 1931 - il démontre parfois un admirable scepticisme et une maîtrise de soi dans ses perceptions. Il exprime des doutes sur la crédibilité de ses sources d'information et même suspecte que certaines des performances.

Leiris exprime ouvertement des réserves quant à l'objectivité de l'ethnographe et se permet plutôt de communiquer ses propres contradictions personnelles - joies, peines et frustrations - à la fois dans la sélection et le commentaire des scènes, qui donne une touche d'humanité unique à *L'Afrique fantôme*.

Leiris commence par un rejet viscéral de tout ce qui est européen et laisse échapper des occasions de railler les indigènes qu'il rencontre - pour être sauvage, analphabète, prélogique - contrairement à d'autres témoins comme Gide. Mais la perspective française de Leiris est néanmoins opérationnelle et nulle ne part plus évidente que dans son rapport paradoxal à la culture métropolitaine bourgeoise, si typique du primitivisme d'avant-garde. Il remarque, par exemple: "Voici enfin que j'aime l'Afrique. Les enfants donnent une impression de gaieté et de vie que je n'ai rencontrée nulle part ailleurs. Cela me touche infiniment " (*ibid.*, 34).

Cette idéalisation de l'Afrique en tant que royaume des enfants, libre des contraintes du monde civilisé, représentait un pays des merveilles inaccessible pour Leiris. Bien que ce mythe primitiviste persistait pour la plus grande partie de son voyage, il finit par reconnaître l'impossibilité de devenir l'enfant ou l'indigène dont il rêvait. Après sept mois de route, Leiris regrette que sa vie en Afrique n'ait pas livré le paradis d'enfance qu'il avait espéré et note: "Avec mon casque, ma chemise kaki, ma culotte de trappeur, je reste le même homme d'angoisse que Certains considèrent comme un bon type, à la fois tranquille et pittoresque, Une sorte d'artiste bourgeois " (*ibid.*, P. 162). Cette frustration résultant de son échec à la quête de l'auto-transformation le suivit tout le chemin du retour à Paris. Plutôt que la moyenne tabula rasa du discours colonial, «l'Afrique» devient une vaste étendue de territoire qui permet à l'écrivain d'explorer lui-même le continent et ses fantasmes, qu'il décrit en termes libidinaux qui ressemblent au désir d'un homme Femme (*ibid.*, 182). Beaucoup d'éléments de primitivisme d'avant-garde structurent la représentation de Leiris de son expérience de l'Afrique: une idéalisation du buisson primitif en contraste avec un mode de vie civilisé métropolitain, le désir persistant de se reconnecter à un être sauvage et indompté, un penchant pour l'exotique et tropical à La dépense d'évaluations plus précises et réalistes, et ainsi de suite.

Leiris note régulièrement leurs acquisitions et les circonstances entourant ces activités, y compris l'utilisation de traducteurs, les négociations prolongées et les scandales intermittents. Ainsi, le processus de collecte des objets apparaît comme un thème constant de la revue. Les remarques initiales de Leiris sur ce sujet reflètent sa participation volontaire au groupe, sa reconnaissance d'une incompréhension entre les Français et les villageois ainsi que la preuve de ce que l'auteur a par la suite appelé son arrogance européenne:

«L'enquête et la collecte d'objets commencent et se poursuivent dans une ambiance parfaitement idyllique. Les gens s'amusent beaucoup de nos questions, qui leur semblent invraisemblables de futilité. Il en est de même de nos achats, puisque tous ces éléments sont susceptibles d'être très frustrés (ibid., P. 41).

Ses réactions, ici celle d'un amusement détaché mélangé à un sentiment d'autosatisfaction, subissent de nombreuses transformations le long du chemin allant de la frustration profonde à l'émerveillement comme Leiris relie les interactions du groupe avec les populations indigènes. Cependant, ce renversement non autorisé des valeurs, des perspectives et de l'intégrité culturelle des populations autochtones caractérise les descriptions de Leiris.

En plus de rassembler des objets pour exposer dans les musées parisiens, l'équipe d'ethnographes sous la direction de Griaule a documenté et étudié divers aspects des cultures africaines qu'ils ont rencontrées y compris les arts traditionnels, le rituel, la religion, la langue et l'histoire. Les notes de terrain qu'ils ont acquises, cependant, reflètent de brèves rencontres puisque l'équipe a passé très peu de temps dans chaque endroit. Ils se sont également appuyés sur des traducteurs et n'ont pas été en mesure de connaître les personnes ou leurs pratiques. En ce sens, la dimension collecte d'objets de l'entreprise et la documentation subséquente qu'ils ont inspirée a contribué plus longtemps à l'étude ethnographique des cultures africaines France. Griaule (1933: 7-12) décrit leur approche ethnographique comme méthodologiquement expérimentale; Forgeant une combinaison originale d'esthétique, de sociologie et de psychologie. Un groupe autour des anciens surréalistes a commencé à développer un intérêt ethnographique dans les cultures non occidentales des colonies françaises d'outre-mer; Des intellectuels tels que Bataille et Leiris ont franchi une étape au-delà des surréalistes et ont pris les cultures dites «primitives» comme objet d'étude ethnographique. Cette synthèse interdisciplinaire dont l'ethnographie française a émergé reflète l'atmosphère et la sagesse de l'entre-deux-guerres, marquant la première étape d'un processus continu qui donnerait lieu à la combinaison de l'anthropologie et du marxisme par les écrivains qui ont contribué aux Temps modernes. Tour ont raffiné leurs outils analytiques en accord avec leur propre ère et ses impératifs. Le point ici est que les engagements français avec la culture coloniale sont dynamiques, mis à jour à mesure que chaque nouvelle génération redéfinit ses méthodes et ne peut être homogénéisée en une seule épistémologie colonialiste.

Si son intention était d'exploiter le côté sauvage et indompté de l'individu dont Breton et les surréalistes écrivaient, l'expérience de Leiris en Afrique produisit presque l'effet inverse. Dans sa quête de quitter lui-même et sa culture - pour devenir Autre - ses quelques moments d'accomplissement viennent d'accomplir ses devoirs bureaucratiques comme archiviste et secrétaire. Le lecteur est témoin d'un double vol dans L'Afrique fantôme: incapable de perdre son moi européen dans le buisson africain tant attendu, Leiris s'enfuit de son angoisse par écrit. La prise de notes devient son refuge ultime:

"Au dîner, je reçois plusieurs lettres. Comme toujours, elles me comblent de joie d'abord puis me plongent dans un abîme de tristesse, en me faisant sentir plus durement ma séparation. Je me couche et je dors à peine, réveillé d'abord par une petite pluie qui me force à regagner mon compartiment, puis par les moustiques, la voiture n'ayant pas de lampe électrique je n'ai pas pu installer ma moustiquaire dans le wagon. 12 juillet. Cafard terrible le matin, à pleurer. Puis salut, en me plongeant dans les travaux bureaucratiques et dans la rédaction de ce journal, depuis quelques jours abandonnés "(ibid., 62).

Un autre coup de cafard! De toute évidence, la réalité de cette expédition n'était pas aussi remplie d'aventure que l'ancien surréaliste l'avait espéré. Quand les émotions deviennent accablantes et les raisons pour lesquelles il quitte la France, il se tourne vers l'écriture, qui devient le véritable processus de découverte.

Après son retour d'Afrique, Leiris a travaillé comme ethnographe, documentant un grand nombre des objets recueillis sur cette mission dans son bureau du Musée de l'Homme. Ces développements marquent le début d'un processus continu d'incorporation des éléments des territoires français d'outre-mer aux pratiques et institutions culturelles françaises. Tout cela faisait partie d'une réorganisation et d'une rationalisation plus profonde de l'identité nationale française dans le contexte de l'héritage impérial de la nation.

Une des interprétations les plus influentes de ce processus d'ajustement conceptuel de l'intelligentsia française à la suite des nouveaux termes de leur participation aux cultures et aux peuples colonisés par la France a été l'argument avancé par James Clifford dans 'The Predicament of Culture (1988)'. Pour rendre compte des affinités conceptuelles entre le surréalisme et l'ethnographie, Clifford propose que les deux activités impliquent un processus de défamiliarisation culturelle. Il compare l'effort du surréalisme pour rendre les aspects familiers de la culture française étranges avec les ethnographes dont le but est de rendre étranges cultures familières. Le processus élémentaire de repenser les valeurs culturelles et de pousser les limites conceptuelles se reflète dans la manière dont Clifford a lié les dimensions d'avant-garde de l'ethnographie et du surréalisme. Il associe l'assaut aux perceptions classiques des valeurs culturelles qui avaient été dirigées contre l'establishment bourgeois par le dadaïsme et le surréalisme avec une relativisation de la supériorité culturelle européenne par rapport aux colonies. Il fait ressortir les similitudes entre l'art d'avant-garde et l'ethnographie et affirme qu'ils ont tous deux servi à décentrer l'autorité culturelle européenne pendant les années 1930.

Pour illustrer sa comparaison du surréalisme et de l'ethnographie, Clifford cite le Collège de sociologie comme son exemple unique de surréalisme ethnographique et L'Afrique fantôme de Leiris comme son seul exemple d'ethnographie surréaliste, mais il admet que les deux sont des constructions utopiques (Clifford 1988: 147). La portée limitée de ses exemples est moins un problème que leur statut utopique; Cela soulève des questions sur ce que c'est en cette période de l'histoire intellectuelle française que Clifford cherche à s'approprier pour faire avancer la critique contemporaine des pratiques culturelles européennes. Si l'ethnographie a contribué à rendre plus visibles les cultures lointaines des populations colonisées par la France à un public métropolitain, la nature du processus conservait encore la centralité d'une perspective française. Bien que Clifford considère la collection et l'exposition d'objets d'art africains dans les musées parisiens comme rédempteurs et alimentés par une idéalisation nostalgique de l'art africain comme quelque chose de «pur» à récupérer par l'Occident, il ne reconnaît pas les implications de cette idéalisation française de l'Afrique Est inscrite dans une épistémologie colonialiste.

L'attention persistante de l'auteur aux détails ici est remarquable. La façon dont il observe ses propres gestes théâtraux suggère un plaisir pervers dans leur démonstration de volonté et de puissance. De même, la description minutieuse de détails tels que la fuite des villageois, les larmes de la jeune femme et la place déserte du village témoigne d'un manque total de compassion pour la perturbation du bien-être de la communauté. La façon dont les hommes d'oreilles roses venaient et violaient l'intégrité spirituelle de cette communauté était sans doute regrettée pour les années à venir. De plus, Leiris semble apprécier le statut de démon, de voleur et de coupable. Il décrit leur départ:

"Les 10 francs sont donnés au chef et nous partons en hâte, au milieu de l'ébahissement général et parés d'un auréole de démons ou de salauds particulièrement puissants ou osés.

À peine arrivée à l'étape (Dyabougou), nous déballons notre butin: c'est un énorme masque à la forme vaguement animale, malheureusement détérioré, mais entièrement recouvert d'une croûte de sang coagulé qui lui confère la majesté que le sang confère à Toutes choses "(ibid., P. 104).

Curieusement, Leiris considère les discussions sur la littérature et l'esthétique comme discontinues avec leur entreprise ethnographique en Afrique. Cet aveu révèle à la fois les attentes de Leiris sur les voyages en Afrique et la disparition éventuelle de ces illusions après plusieurs mois sur la route. Cette admission clarifie encore comment les informations recueillies au cours de leur voyage à travers l'Afrique a été filtré à travers l'esprit des intellectuels qui ont trouvé la conversation sur les grandes œuvres de la tradition littéraire européenne irrésistible, même une fois qu'ils sont arrivés dans le buisson longtemps attendue d'Afrique. Mais le fait qu'un filtre esthétique soit présent n'est pas du tout incongru; Au contraire, l'esthétique était à l'origine de l'engagement des intellectuels français avec les cultures non occidentales en termes ethnographiques. Ce que cette affirmation dément, c'est la façon dont leur centre de gravité est resté européen et que le sien a été la cause de la consternation.

Une autre explication influente des engagements français avec l'Afrique est une version recyclée de l'hypothèse originale d'Edward Said que le geste européen d'atteindre vers les cultures étrangères met le visage intellectuel face à son propre désir. C'est aussi une idée puissante et convaincante, mais elle exclut la possibilité de processus dynamiques et de changements progressifs au fil du temps, contrairement à l'approche de Clifford, qui prétend trop optimiste sur l'avenir pour les avant-gardes européennes. Bien que le filtre perceptif de Leiris ait été nuancé par des

préoccupations personnelles et un primitivisme d'avant-garde alors qu'en Afrique, au cours des années 1930, des semences ont été plantées qui ont permis des expériences ultérieures - son amitié avec Aimé Césaire, plus de voyages en Afrique et dans les Caraïbes - . En ce qui concerne les épistémologies européennes et les perceptions de l'altérité, Marc Augé a observé de façon provocante que les ethnographes du type décrit dans *L'Afrique fantôme* étaient principalement engagés dans le dialogue avec eux-mêmes et que cela tend généralement à être le cas (Augé 1992: 36-40).

Il semble difficile de contester la vision euro centrique de l'art africain et son parrainage par l'establishment artistique en France pendant les années de l'entre-deux-guerres. La mission Dakar-Djibouti, par exemple, a été financée en partie par le gouvernement français et par des soirées de cravate noire organisées en tant que fonds de levée, auxquels ont assisté des hommes blancs à chaussures brillantes. La tendance de «l'art nègre», comme on l'appelait, pendant les années d'entre-deux-guerres attirait à la fois l'establishment et ses dissidents; Il s'adressait aux marchands d'art riches ainsi qu'aux artistes d'avant-garde et aux ethnographes. Le parrainage et l'intérêt divers de la mission Dakar-Djibouti montrent comment le primitivisme français était un phénomène culturel moins lié à la décentralisation de l'autorité culturelle française qu'à l'adaptation de certains aspects de l'identité française à la consolidation de l'empire colonial français. En tant qu'événement, la mission Dakar-Djibouti suggère un processus élaboré d'interprétation et de tri des différences culturelles. La première ethnographie française a pris forme ainsi dans le cadre d'une tentative de dériver un vocabulaire conceptuel permettant d'articuler les mutations internes de la culture française résultant d'un engagement sans précédent avec les cultures et les populations des territoires d'outre-mer français. Il a fallu du temps, cependant, pour que les pratiques culturelles qui ont été inspirées par le primitivisme d'avant-garde se développent en des formes plus réfléchies d'enquête culturelle. A ce stade, le primitivisme d'avant-garde partagé par les surréalistes et les surréalistes dissidents devenus ethnographes provient de leur propre désillusion avec la société européenne en tant qu'intellectuels français. Au cours de l'entre-deux-guerres, l'appropriation conceptuelle de cette lointaine altérité par l'avant-garde française a été motivée par un désir occidental d'une existence «primitive» idéalisée, comme celle qui est venue avant la vie cosmopolite décadente.

La pratique de rejoindre l'Afrique et de ramener les artefacts culturels de la manière dont Leiris décrit inéluctablement la réinscription des relations de force fondamentales du colonialisme, qui permet à ces «matières premières» d'être façonné en produits pour la consommation métropolitaine. Les relations de pouvoir qui définissent cette forme d'«échange» culturel sont plus claires pour ceux qui sont désabusés par la transaction. En fait, la position de privilège inavoué que les artistes et les intellectuels d'avant-garde jouissaient pendant les années d'entre-deux-guerres a créé une cécité critique dans leur perception de tous les aspects des cultures «primitives» en question. Dans les fantasmes occidentaux, l'art «primitif» tend à se situer dans le passé, en association avec une existence antérieure idéalisée, et cette vision s'avère incompatible avec la vision des artistes africains comme contributeurs actifs à la redéfinition de la culture contemporaine.

Avec le temps, Leiris reconnaît les limites de son filtre subjectif dans la préface qu'il écrivit à la deuxième édition de *L'Afrique fantôme* en 1950:

"Je ne puis nier, cependant, que l'Afrique du début de l'avant-dernière décade était elle aussi bien réelle et que ce n'est pas fait à elle mais à moi il faut que je m'en prenne si Les problèmes humains qui s'y posent déjà ne m'ont frappé que les enlées revêtent l'aspect d'abus absolument criants, sans m'arracher pour autant à mon subjectivisme de rêveur "(Leiris 1981: 12).

Le subjectivisme de rêveur de Leiris ne lui permettait pas de s'engager sérieusement dans les réalités sociales et politiques qu'il rencontrait, bien qu'il reconnaisse rétrospectivement qu'elles étaient là pour lui voir. Le vocabulaire qu'il utilise pour décrire les limites de sa perspective en 1931 évoque explicitement le surréalisme et sa conception du sujet. Comme Leiris décrit son changement de perspective, il se réfère, comme Breton, à son expérience de la Seconde Guerre mondiale:

"C'est un livre bien dépassé par la situation - et pour moi bien vieilli - que cette Afrique fantôme réimprimée aujourd'hui quelques années après la mise au pilon, pendant l'occupation allemande, de presque tout le reliquat de sa première édition" (Ibid., P. 11).

Leiris discute de la censure de *L'Afrique fantôme* sous Vichy France, ainsi que d'un changement d'attitude face aux questions de race, de nation et de formes de protestation politique. La Seconde Guerre mondiale a aidé l'intelligentsia de gauche en France à voir l'exploitation coloniale et la réaction de la Négritude à une nouvelle

lumière. En fin de compte, Leiris allait plus loin que Breton en mettant à jour ses idées et ses valeurs avec les temps. Au cours de la période d'après-guerre, Leiris devient rédacteur en chef de la revue *Les Temps modernes* de Jean-Paul Sartre, où il présente la poésie d'Aimé Césaire.

Essentiellement, il l'a écrit pour lui-même. Il croit qu'il a déjà dit que c'était un livre expérimental, documentaire. Il avait plein de littérature, surtout de surréalisme; Il avait eu plus que lui pourrait prendre de la civilisation occidentale. Il voulait voir ce qui se produirait quand il s'est forcé à enregistrer pratiquement tout ce qui s'est passé autour de lui et tout ce qui a traversé dans sa tête. C'était essentiellement l'idée de son écriture.

Abstract

Breast cancers that demonstrate the absence of estrogen receptor and progesterone receptor and no overexpression of human epidermal growth factor receptor 2 (HER2) are referred to as triple-negative breast cancer (TNBC). Globally 1 million cases of breast cancer are diagnosed annually and Triple-negative breast cancer comprises 15%-20% of all breast cancers. The last decade has seen a revolution in the understanding of breast cancer, with new classifications proposed that have significant prognostic value and provide guides to treatment options. There are many biomarkers in TNBC used for its sub-classification. Clinically-practical assay/biomarkers that can reliably identify TNBC are necessary. Biomarkers may be useful as prognostic or predictive indicators as well as suggest possible targets for novel therapies.

Introduction:-

Triple-negative breast cancers (TNBCs) are defined by the absence of estrogen and progesterone receptors and the absence of HER2 overexpression. These cancers represent a heterogeneous breast cancer subtype with a poor prognosis. In 2012 about 1.7 million women worldwide were diagnosed with breast cancer (BC), and 521,900 women died from it. (1-2) TNBC represents 10%–20% of invasive breast cancers and has been associated with African-American American race, deprivation status, younger age at diagnosis, more advanced disease stage, higher grade, high mitotic indices, family history of breast cancer and *BRCA1* mutations. TNBC is regularly reported to be three times more common in women of African descent and in pre-menopausal women, and carries a poorer prognosis than other forms of breast cancer. (3) These statistics include all subtypes of BC, but it is well known that BC is not a homogeneous disease. Tumors in the breast have long been classified according to their morphologic features, histologic type, and grade (severity). Four major intrinsic subtypes have been identified by genomic studies: the luminal subtypes A and B, which express hormone receptor-related genes, basal-like (BL) BC, and HER2-positive BC. (4) More recently, gene expression analysis using DNA microarray technology has identified additional breast tumor subtypes that were not apparent using traditional histopathologic methods. Based on gene expression profiles, breast cancer can be classified into 5 main groups Luminal A, Luminal B, Basal-like, HER2, Normal breast-like. (5-6) Most breast cancers originate from the inner ("luminal") cells that line the mammary ducts. Luminal A and luminal B tumors are similar in that both are typically ER+ or PgR+, or both. However, they are dissimilar in that the A type is usually HER2- and the B type is more likely to be HER2+ and lymph node-positive. Women with luminal A tumors are often diagnosed at a younger age. They tend to have the best prognosis, with relatively high rates of overall survival and relatively low rates of recurrence. Those with luminal B tumors tend

Address:-Department of surgical oncology, Faculty of Medicine, University of Tabuk, Kingdom of Saudi Arabia.

to have a higher tumour grade and a poorer prognosis (7-8). TNBC is a distinct breast cancer. It is classified into six groups based upon the GEP and DNA microarray. This sub-classification is not only useful in understanding the disease better but also to find molecular targets for its treatment (9).

BL-1 and BL-2:-

The BL-1 subtype was found to be composed rapidly dividing cells associated with increased proliferation and cell cycle checkpoint loss consistent with the increased expression of DNA damage response genes. Due to its high proliferation rate it has increased Ki67 mRNA expression and it is more responsiveness to antimetabolic agents targeting cell cycle. The BL-2 subtype on the other hand displayed unique gene ontologies involving epidermal growth factor signaling as well as glycolysis and gluconeogenesis pathway. On microarray it showed a higher expression of epidermal growth factor receptor (EGFR), TP63, MET, *etc.*

Immunomodulatory subtype:-

Immunomodulatory (IM) is composed of immune cell responses such as immune cell and cytokine signaling, antigen presentation and processing and signaling of immune transduction pathways. Its GEP substantially overlaps with the medullary breast cancer, histologically a rare distinct form of TNBC which carry favorable prognosis despite its high grade.

Mesenchymal and mesenchymal stem like subtype:-

On GEP these subtypes consist of epithelial-mesenchymal (M) transition and growth factor pathways. The mesenchymal stem like subtype is also expressed by genes involved in angiogenesis including VEGFR2 and was found to be highly responsive to dasatinib [tyrosine kinase (TK) inhibitor], and mTOR inhibitors.

Luminal androgen receptor subtype:-

This subtype is characterized by androgen receptor (AR) signaling. It is ER negative but gene ontologies were heavily composed of hormonally regulated pathways such as steroid synthesis, porphyrin metabolism and androgen/estrogen metabolism. AR mRNA expression was nine times higher than other subtypes therefore, these lines were found to be highly sensitive to AR antagonists enzalutamide. Patients with this subtype had decreased DFS and OS.

Biomarkers in TNBC:-

Identification of molecular markers such as expression of the estrogen (ER) and progesterone receptors (PgR) and the human epidermal growth factor receptor 2 (HER2) has offered additional predictive value for the therapeutic assessment of women diagnosed with breast cancer. TNBC is characterized by the marked expression of certain biomarkers. The presence of these molecules though is not restricted to TNBC but somehow show increased prevalence in this subgroup. The following are the important biomarkers in TNBC.

Epidermal growth factor receptor (EGFR):-

The four receptors being EGFR (or ErbB-1), HER-2/neu (ErbB-2), HER-3 (ErbB-3), and HER-4 (ErbB-4). The inactive monomer receptor dimerizes after ligand activation followed by TK, the intracellular domain of the receptor is activated by autophosphorylation, leading to a cascade of intracellular events (10). Epidermal growth factor receptor (EGFR) is a transmembrane tyrosine kinase receptor that plays a central role in regulating cell division and death. It belongs to the HER family of receptors, which includes EGFR (HER1/ErbB1), ERBB2 (HER2/neu), ERBB3 (HER3), and ERBB4 (HER4). These receptors are characterized by an extracellular ligand-binding domain, a transmembrane domain, and a cytoplasmic domain containing the tyrosine kinase region followed by a carboxy-terminal tail with tyrosine autophosphorylation sites as depicted in figure 1 (Honey V et al: 1/10/2013 AACR). EGFR signal cascade is important for cell proliferation, angiogenesis, metastatic spread, and the inhibition of apoptosis. Most of the TNBCs express EGFR, and poses a strong therapeutic challenge (11).

Figure 1:-Honey V et al: 1/10/2013 AACR.

EGFR expression is found in 40%-50% of patients with breast cancer and in 80% of TNBC; and is estimated to substitute major proliferation pathways of breast cancer induced by activation of HER-2, ER, PR proteins which are thereby absent in TNBC(12). EGFR expression in TNBC is associated with poor response to chemotherapy (13).Nogi et al (14),observed that EGFR was expressed in 24% of the TNBC patients and was related to less favorable response to chemotherapy and poorer survival and on the contrary the luminal groups where EGFR expression showed a good response to chemotherapy and better survival. Recently EGFR has been defined with other markers to differentiate BL subtype from TNBC (15).**Epidermal growth factor receptor (EGFR) is more frequently expressed in TNBCs than in non-TNBCs. Therefore, the EGFR is considered a candidate treatment target for TNBCs.TNBCs have an aggressive clinical course, and EGFR might be candidate therapeutic targets in this disease. This aids in segregating TNBC into subtypes and thus defining the prognostic difference and molecular target specification between the two. So EGFR is a biomarker in TNBC and a target for cetuximab, a TK inhibitor.**

Vascular endothelial growth factor:-

High VEGFR2 expression, EGFR expression, and EGFR gene copy number were significantly correlated to TNB, supporting their role as putative candidate biomarkers for selection of targeted therapy in TNB. Vascular endothelial growth factor (VEGF-A) is considered a prognostic indicator for clinical outcome in breast cancer.Angiogenesis is important for tumor growth and spread especially beyond a diameter of 2 mm as oxygen and nutrients cannot diffuse beyond this distance. Angiogenic signals are mediated by vascular endothelial growth factor (VEGF) to aid neovascularisation. VEGF protein is found in 4 isoforms because of alternative splicing of its mRNA(16). Among the different isoforms VEGF165, the 165-amino acid molecule is more common (17). Its gene

expression is controlled by many of stimuli such as hypoxia, nitric oxide, growth factors, oncogenes, tumor suppressor genes and HER-2 (18). Vascular endothelial growth factor A (VEGF-A) and vascular endothelial growth factor receptor 2 (VEGFR2) are often coexpressed in breast cancer, and potentially affect cellular pathways and key proteins such as the estrogen receptor (ER) targeted by endocrine treatment. In TNBC higher VEGF levels are associated with shorter DFS, OS, and DDFS. Also, VEGF levels have been significantly related to the size of the tumor, grade and metastatic sites. In patients with higher VEGF levels disease progressed despite of therapy and such patients were associated with significantly lower progression free survival as compared to patients with lower levels. In TNBC patients it was found that VEGF level elevated from baseline to middle of the therapy significantly but showed a non significant increase from the middle of the therapy to its end when patients were administered FAC (19). VEGF is a target for bevacizumab in TNBC patients. High VEGFR2 expression was significantly correlated to decreased BCSS in TNB patients. TNB was associated with decreased BCSS and clinicopathological characteristics of an aggressive tumor type. High VEGFR2 expression was significantly correlated to TNB, supporting their role as putative candidate biomarkers for selection of targeted therapy in TNB (20).

Poly(ADP-ribose) polymerase (PARP):-

The discovery of poly(ADP-ribose) >50 years ago opened a new field, leading the way for the discovery of the poly(ADP-ribose) polymerase (PARP) family of enzymes and the ADP-ribosylation reactions that they catalyze. Although the field was initially focused primarily on the biochemistry and molecular biology of PARP-1 in DNA damage detection and repair, the mechanistic and functional understanding of the role of PARPs in different biological processes has grown considerably of late. *PARPs* are a family of cell signaling enzymes present in eukaryotes, which catalyzes the poly(ADP-ribosylation) of DNA binding proteins (21-22). Till now eighteen enzymes of *PARPs* has been detected, but *PARP1* the most common isoform. *PARP1* is responsible for the majority of its functions. The main function of *PARP1* is as DNA damage nick sensor. It forms polymers of ADP-ribose and nicotinamide with the use of NAD^+ . Activation of *PARP1* is important in tumors because of three interesting biological reasons: First, it plays a vital role in DNA repair through base excision repair pathway; second, it is capable of depleting cellular energetic pools, which results in cell dysfunction and necrosis; and third, its ability to promote the transcription of proinflammatory genes. *PARP* enzymes are involved in cellular response to inflammation, ischemia and oxidative stress. *PARP1* are involved in all these cellular processes, indicating the possible link between *PARP1* function and carcinogenesis (23). *BRCA2* operates through excision repair pathway like *BRCA1*, mutation of this gene make the cells susceptible to *PARP* inhibitors as well (24,25). *PARP* also plays a vital role in DNA repair as *BRCA*. Unlike *BRCA* it recognizes SSBs and repairs by base excision repair pathway. *PARP* inhibitors are effective in TNBC because damage to one of the arms of the DNA could not be repaired by homologous recombination due to *BRCA* mutation and *PARP* inhibition in synergism will create a state of "synthetic lethality" - a process that occurs when inactivation of individual genes have no effect but mutations in both the genes lead to death of cancer cells (26). So *BRCA* mutation is responsible for the action of many chemotherapeutic agents in TNBC. The inhibition of *PARP1* is also known to potentiate the effect of ionizing radiation and many drugs such as DNA methylating agents, topoisomerase inhibitors, and platinum compounds. Studies in mouse models have shown that the addition of *PARP* inhibitors with platinum compounds increases RFS and OS (27) while many of other studies on cell lines reveal that the activity of *PARP* inhibitors was increased in presence of *BRCA* mutations or dysfunction (28). *PARP1* has been targeted as therapeutic option in TNBC with drugs like iniparib, olaparib etc though not found to be independently helpful but their addition to cytotoxic agents have surely brought synergism to their activity and improvement in treatment response in TNBC patients

MicroRNAs Biomarkers:-

To date, the treatment strategies for TNBC are limited to surgery, chemotherapy and radiation, owing to the lack of effective therapeutic targets. Therefore, it is important to identify specific targets for TNBCs. MicroRNAs (miRNAs), a family of small non-coding RNAs regulating gene expression, are an emerging class of regulators of various biological processes, including cell proliferation, invasion, epithelial-mesenchymal transition (EMT) and drug resistance. Actually, miRNAs may serve as a novel therapeutic target in TNBC. In a more recent study, 34 miRNAs were observed to be significantly differentially expressed among the luminal A, HER2-amplified and triple negative cell lines (29), and the biologic profiling of miRNA signatures for different subtypes were also extensively explored in breast cancer tissue samples (30,31). It was functionally demonstrated that miR-498 inhibits *BRCA1* in breast cancer cell lines, and showed that inhibition of miR-498 led to reduced proliferation in the triple negative cell line Hs578T and results indicate that miR-498 regulates *BRCA1* expression in breast cancer and its overexpression could contribute to the pathogenesis of sporadic TNBC via *BRCA1* downregulation.

MiR-21 (oncomiR)-miR-21 an oncomiR was proven to regulate *PTEN* by targeting the mRNA 3'UTR, leading to an anti-apoptosis effect in TNBC (32). Specifically, miR-21 exhibits a higher expression level in TNBC than non-TNBC, and it is positively correlated with a poor clinical outcome.

miR-203 (oncosuppressor)-In contrast to the miRNAs afore-mentioned, miR-203 is an oncosuppressormiRNA which plays a specific metastatic suppressor role by targeting *LASPI* in TNBC, it can significantly inhibit cell proliferation by regulating *BIRC5* (33). Thus, the miRNAs controlling the expression of quite a few key genes are likely to affect tumor behavior and progression in TNBC. With the improvement of tumor biology understanding, an increasing number of known miRNAs have been identified to be prognostic in TNBC. Inverse correlation between miR-27b and distant relapse-free survival (DRFS) was found by performing miRNA expression profiles, while miR-342 and miR-150 were correlated with better prognosis (34).

There are some miRNAs, such as miR-210 (35), miR-155 (36), miR-27b-3p (37), miR-34b (38) and miR-21 (39), that could be poor prognosis indicators in TNBC. It is worth mentioning that the protective miR-497, was identified downregulated in TNBC vs. both normal tissue and non-TNBC cells (40), indicating its putative positive effect against aggressive malignant phenotype in TNBC. The miR-210, was up-modulated in TNBC vs. both normal and non-TNBC tissues, thereby, providing a potential therapeutic target for TNBC.

C-kit and basal cytokeratins:-

C-kit is a cytokine receptor present on the surface of hematopoietic stem cells and also in other cells. C-kit binds to stem cell factor and is a growth factor receptor that stimulates major cellular functions such as cell survival, proliferation, differentiation, adhesion and chemotaxis. It induces apoptosis and also increases the invasiveness of the cancer cells (41). KIT plays a critical role in cell proliferation and differentiation and represents a logical therapeutic target in GIST and CML. The study of the CK profile by IHC techniques is very important for tumor pathologic classification (42). CKs were earlier used to distinguish malignant breast lesions from benign ones (43), but later their prognostic value was ascertained and it was seen that expression of CK-5, CK-14 and CK-17 was related to poor prognosis, high grade tumors, ER negativity, short DFS and OS (44). It is expressed in BLBCs. Since BLBC and TNBC show overlapping features therefore C-kit and basal CKs along with other markers and pathological features are used for the differentiating BLBCs from TNBC. Many studies have revealed that presence of CKs is higher in TNBC than non-TNBC and also among TNBC subgroup it is higher in the BL subclass. BL subclass of TNBC was identified on the basis of CK and EGFR expression and when the clinicopathological features were compared between the basal and non-BL it was seen that BL subclass of TNBC was more aggressive (45).

The Ki-67 protein (also known as MKI67):-

Antigen Ki-67 is a nuclear protein that is associated with and may be necessary for cellular proliferation. Furthermore, it is associated with ribosomal RNA transcription. Inactivation of antigen Ki-67 leads to inhibition of ribosomal RNA synthesis. Ki67 is a cellular marker for proliferation. Ki67 antigen is present inside the cell nucleus during interphase and during mitosis it is relocated to the surface of the chromosomes. Since it is a marker of proliferation it is found in all cells when they are in dividing phases of the cell cycle (G_1 , S, G_2 , and mitosis) and it is absent from cells during their resting phase (G_0). Its absence in resting cells and generalized presence in dividing cells had made it a marker of cell proliferation (46). Proliferation is a salient feature for the spread of cancer and can be assessed by the IHC measurement of the nuclear antigen Ki67. Its over expression also correlates with levels of bromodeoxyuridine uptake and S-phase fraction, other markers of proliferation. Ki67 expression is less in normal breast tissue (< 3%). Recently it has been reported in many studies that Ki67 antigen and steroid-receptor are expressed in different cells in normal human breast epithelium. Ki67 was over expressed particularly in ER-negative cells and its expression in carcinoma cells was much higher (47-48). In TNBC, it was found that Ki67 levels were significantly increased in ductal TNBC compared to other histologic types (80% in TNBC vs 10%-30% in other types). Its expression also represented a direct co relation with tumor size and grade in TNBC patients and higher levels (> 35% staining) were linked with an increased risk of death (49-51). In TNBC patients Ki67 accumulation was associated with a higher pCR to chemotherapy but poor RFS and OS. Its expression was also used for subdivision of TNBC into two subtypes where only 26.7% of TNBC patients showed lower Ki67 expression (52).

DNA topoisomerase 2-alpha:-

Amplification or deletion of the topoisomerase II alpha (*TOP2A*) gene in breast cancers has been postulated to be more closely associated with responsiveness to anthracycline-containing chemotherapy than amplification of the

human epidermal growth factor receptor type 2 (*HER2*) gene. Patients with *TOP2A* overexpression have a worse prognosis compared with those with *TOP2A* nonexpression, and *TOP2A* may be a useful biomarker in patients receiving adjuvant taxane-platinum regimens with moderate- to high-risk endometrial cancer (53-54). DNA topoisomerase 2- α is an enzyme that in humans are encoded by the *TOP2A* gene. This gene encodes a DNA topoisomerase, an enzyme that controls and alters the topologic states of DNA during transcription. This nuclear enzyme is involved in processes such as chromosome condensation, chromatid separation, and the relief of torsional stress that occurs during DNA transcription and replication. It catalyzes the transient breaking and rejoining of two strands of duplex DNA which allow the strands to pass through one another, thus altering the topology of DNA. Two forms of this enzyme exist as likely products of a gene duplication event. The gene encoding this form, α , is localized to chromosome 17 and the β gene is localized to chromosome 3. The gene encoding this enzyme functions as the target for several anticancer agents and a variety of mutations in this gene have been associated with the development of drug resistance. Reduced activity of this enzyme may also play a role in ataxia-telangiectasia (55). In TNBC or breast carcinoma the gene acts as a target for anthracycline therapy which is a topoisomerase II inhibitor (56). So it is a marker for the evaluation of resistance to the anthracycline therapy. A study revealed a higher expression of *TOP-2A* in 2.7% to 8.8% of TNBC patients (57). Its over expression in TNBC leads to the decreased sensitivity towards the anthracyclines and thus decreased response. *TOP2A* expression is a marker of the tumor's proliferation rate and sensitivity to anthracycline-based chemotherapy, and does not depend on the amplification of its gene.

MAP kinase pathway:-

Mitogen-activated protein kinase (MAPK) pathways are evolutionarily conserved kinase modules that link extracellular signals to the machinery that controls fundamental cellular processes such as growth, proliferation, differentiation, migration and apoptosis (58). MAPK pathways are comprised of a three-tier kinase module in which a MAPK is activated upon phosphorylation by a mitogen-activated protein kinase kinase (MAPKK), which in turn is activated when phosphorylated by a MAPKKK. To date six distinct groups of MAPKs have been characterized in mammals; extracellular signal-regulated kinase (ERK)1/2, ERK3/4, ERK5, ERK7/8, Jun N-terminal kinase (JNK)1/2/3 and the p38 isoforms $\alpha/\beta/\gamma$ (ERK6)/ δ (59). The mitogen-activated protein (MAP) kinase cell signaling pathway promotes cell growth, proliferation, and survival. The MAP kinase pathway may be activated via several different routes, including upstream growth factor receptor tyrosine kinases and downstream mutations in pathway gene components (60). The MAP kinase pathway has also been evaluated as a potential target in TNBC, with corresponding biomarker studies performed. Preclinical evaluation of 21 breast cancer cell lines treated with MEK1/2 inhibitor trametinib demonstrated the greatest sensitivity in the 11 TNBC cell lines evaluated. The authors ultimately identified DUSP6, a phosphatase that decreases pERK2 activity upon MAPK pathway activation, as a potential marker of sensitivity to the drug. Expression of this gene was associated with greater sensitivity to trametinib in multiple solid tumor cell lines, though was not evaluated in the breast cancer models (59). Mutations that serve as targets for currently available agents, including *EGFR*, *HER2*, *KRAS*, and *BRAF* mutation as well as *MLL4-ALK* fusion and *EGFR* copy gain have also been studied in TNBC. Of 65 TNBC specimens, the only abnormalities identified were a *HER2* mutation in one patient and *EGFR* gene amplification in a second patient (61). This suggests little utility for use of these mutations as biomarkers or as potential targets for therapy. These numerous studies are encouraging in their efforts to identify biomarkers for TNBC in the setting of novel targeted agent development. However, the best data for any of these biomarkers has still been developed in only small preclinical or retrospective studies. There is hope that these promising findings will be further evaluated in large, prospective trials, and that coordinated drug and biomarker development may be central to such trials in the future.

Conclusion:-

Evaluation of biomarkers for currently available chemotherapeutic agents should focus on the mechanism and characteristics of each agent separately, rather than on chemotherapy in general. With these changes in the development of predictive biomarkers for TNBC comes the possibility for exciting advances in this field for the future. TNBC is the most poorly understood and is refractory to current targeted therapies. It is a cause of significant breast cancer mortality because of very few treatment options. A biomarker may be useful as prognostic or predictive indicators as well as suggest possible targets for novel therapies.

 Mathematics education; Benefit.

Abstract

Problem posing has received considerable attention recently by researchers in mathematics education. Researchers in mathematics education have reported that problem posing is an effective strategy for teaching and learning mathematics. This study was carried out to bring to limelight the benefits of problem posing intervention in learning mathematics. The study was a systematic review of empirical studies on the effects of problem posing instructional strategy in the learning of mathematics. Search for the studies was both electronically and manually, and many studies were found, but only 16 studies met the requirements for inclusion, and the participants involved in these studies were 1871. The studies that met the requirements were examined in depth, especially in terms of the title, study design, participants and findings of each study. It was revealed that all the studies reported significant improvement in the learning outcomes studied. The learning outcomes related to all the 3 learning domains of Bloom's taxonomy (cognitive, psychomotor, and affective). Problem posing instructional strategy was reported to have impacted positively on the students' learning of mathematics. Problem posing instruction was shown to support knowledge-based, skill-based, ability-based and attitude/belief-based learning. It was advocated that problem posing be made an integral part of the mathematics curriculum.

Introduction:-

Researchers in mathematics education view problem posing as a significant mental activity in mathematics (e.g. Rosli, Capraro & Capraro, 2014; Sengul & Katranci, 2012; Lavy & Shriki, 2007; Pittali, Christou, Mousoulides & Pitta-Pantazi, 2004). In fact, some researchers referred to it as being at the heart of mathematics (Kojima, Miwa & Matsui, 2015). Problem posing is a research topic in mathematics that is currently receiving the attention of many mathematics educators. Researchers such as Akay and Boz (2008) and Lavy and Shriki (2007) pointed to problem posing as an important strategy for teaching and learning mathematics, while others consider it an important skill that helps in solving problems (Kojima, Miwa & Matsui, 2015; Guvercin & Verbovskiy, 2014; Silver, 1994). Akay and Boz (2008) pointed a close relation between problem posing as an approach and academic success.

There is a general consensus of researchers in Mathematics education that problem posing is the creation of new problems and the recreation of given problems. For instance, Stoyanova and Ellerton (1996) see posing problem as

the process by which students create personal explanations of concrete situations and formulate such situations into sensible mathematical problems. Similarly, Pittalis, Christou, Mousoulides and Pitta-Pantazi (2004) define posing problems as creation of new problems and reformulation of given problems. This study considers problem posing as the creation of new problems and changing certain parameters of existing problems.

Posing problems in the learning of mathematics:-

The benefits of posing problems have been pointed out by many researchers in mathematics education. For instance, Pittalis et al (2004) pointed out that students could solve mathematical word problems as a result of using problem posing as an instructional strategy. Similarly, English (1997) found that problem posing afforded teachers the opportunity to comprehend students' thinking about concepts and processes in mathematics. Research has also indicated that problem posing improves students' thinking and problem solving skills (Guvercin & Verbovskiy, 2014), attitudes and confidence in mathematics (Guvercin, Cilavdaroglu & Savas, 2014). Similarly, according to Lavy and Shriki (2007) and Stoyanova (1999) posing problem fosters flexible thinking, and enhances students' problem solving skills, reasoning and reflection. Problem posing is a necessary part of learning mathematics (Sengul & Katranci, 2012; Lavy & Shriki, 2007). Kojima, Miwa and Matsui (2015) say it is an important activity in mathematics education, and lies at the heart of mathematical activity. They assert that problem posing is a necessary skill for solving problems. Singer, Ellerton and Cai (2013) assert that posing problem raises creativity in students and adds to mathematics talent and independent learning. Posing problem is viewed as an investigative-oriented instruction, and also as a distinct feature of creative activity (Silver, 1994). In fact, Ticha and Hospesova (2009) point out the potential benefit of problem posing as the diagnosis of teacher-students' subject teaching knowledge. In other words, problem posing can detect the nature of the student's mathematics learning problem.

Similarly, Ticha and Hospesova (2006) assert that problem posing is one of the potential options for pre-service primary mathematics teachers to acquire professional aptitude in mathematics. According to Ticha and Hospesova (2009), experience has revealed that pre-service primary mathematics teachers' subject teaching competence is dependent on their ingenuity to create mathematical problems. This, therefore, underscores the importance of engaging in activities that are targeted at problem posing as an instructional strategy in the teaching and learning of mathematics. This importance has been pointed to by many mathematics education researchers such as English (1997), Pittalis et al (2004), Akay and Boz (2008), and Cankoy and Darbaz (2010). These mathematics educators and a host of others have stressed the desire and importance for students to acquire the ability to pose problems. Ticha and Hospesova (2009) opine that problem posing should not be seen only as a goal of teaching, but also as a means of teaching. Problem posing relates to competence in mathematics and, this is the reason for emphasizing that students be given the opportunity to create their own problems in the learning of mathematics. There is a consensus among mathematics educators that problem posing enriches student's learning of mathematics, and guides the students to a deeper understanding of mathematical concepts (e.g. Abu-Elwan, 2002; Guvercin & Verbovskiy, 2014; Haghverdi & Gholami, 2015).

This study focused on searching the literature to highlight the benefits of problem posing in the learning of mathematics. It is a systematic review of experimental studies that have been conducted on the effect of problem posing as an instructional strategy in the teaching and learning of mathematics. Many experimental studies have been carried out in mathematics with problem posing as an instructional strategy (e.g. Abu-Elwan, 2002; Akay & Boz, 2008; Priest, 2009; Kesa, Kaya & Guvercin, 2010; Guvercin & Verbovskiy, 2014; Kojima, Miwa & Matsui, 2015). And a variety of outcomes have resulted from such studies. There is therefore the need for a systematic review of the literature to highlight these results, especially that the studies are conducted at various locations on the continent.

Purpose of the study:-

Research has shown that there are many studies in mathematics education that used problem posing as an instructional strategy to determine students' achievement in mathematics, and so the desire to investigate the benefits of problem posing is timely. Research evidence has indicated improvements on students' learning of mathematics through problem posing intervention. The purpose of this study was to answer the question: do students benefit more when problem posing is used as an instructional strategy in the teaching and learning of mathematics? The study employed a systematic review of empirical studies to investigate the effect of problem posing on students' learning of mathematics. This was done by considering experimental studies only.

Method:-**Criteria for the selection of studies to be included:-**

The first step was to determine the keywords to be used for searching on the website. These words or phrases included, *problem posing in mathematics*, *effect of problem posing in mathematics*, *problem solving and problem posing in mathematics*, *experimental studies in mathematical problem posing*, *investigation of problem posing in mathematics* and *effectiveness of problem posing*. The next step was a manual search in the Journals of Mathematics Education and other Multidisciplinary Journals. The search was restricted to only journals written in English Language. Only experimental studies that indicated clearly the research design, respondents/population, and the results were considered as meeting the requirements for inclusion. However, the literature review in the background was not restricted to review of experimental studies only.

Upon these searches, many studies relating to problem posing in mathematics were found. In fact 3,815 studies resulted from these multiple searches. But most of the studies found did not meet the requirements for inclusion. Majority not experimental, some were duplicates, others inaccessible or not traceable, and a few others not published in English Language. Therefore, all those studies that did not meet the requirements for inclusion were discarded. The experimental studies were examined in depth with respect to the eligibility criteria for inclusion. Applying these criteria only 16 studies were retained, and the analysis is shown in Table 1.

Table 1:- Experimental Studies on Effects of Problem Posing.

Author and date	Title of study	Participants	Results/findings
Abu-Elwan (2002)	Effectiveness of problem posing strategies on prospective mathematics teachers' problem performance	Student-teachers 50	1.Problem posing significantly improved the mathematics achievement of the experimental group 2. Experimental group exhibited significantly higher level of problem posing performance compared to the control group.
Akay & Boz (2008)	The effect of problem posing oriented Calculus-II instruction on academic success	Pre-service teachers 79	1.Problem posing approach increased the academic success of the experimental group 2. A close and positive relation between academic success and problem posing approach was found.
Akay & Boz (2010)	The effect of problem posing oriented analysis II course on the attitudes toward mathematics and mathematics self-efficacy	Elementary pre-service teachers 82	1. Significant differences were found in the participants' attitudes toward mathematics and mathematics self-efficacy between the experimental and control groups. 2. The experimental group showed positive attitude toward mathematics.
Cankoy & Darbaz (2010)	Effect of a problem posing based problem solving instruction of understanding problem (UP)	3 rd grade students 53	1. Experimental group students were better than the control group students in terms of UP scores in all dimensions (rephrasing, visualization and qualitative reasoning). 2. Experimental group was better than control group in finding missing information in a given problem and the contradictions of a problem.

Demir (2005)	The effect of instruction with problem posing on tenth grade students' probability achievement and attitudes toward probability	Tenth Grade 82	<ol style="list-style-type: none"> 1. The students taught by problem posing instruction had significantly greater probability achievement than students taught by traditional method. 2. There was a significant difference between the mean scores of the students who received instruction with problem posing and those who were taught without in terms of attitudes toward probability.
English (1997)	The development of fifth grade children's problem posing abilities	Fifth Grade children 27	<ol style="list-style-type: none"> 1. Substantial development was exhibited by children who participated in the program
English (1998)	Children's problem posing writing formal and informal contexts.	Year 3 in elementary school 54	<ol style="list-style-type: none"> 1. Children's participation in the problem posing program led to greater diversity in the problems posed.
Fetterly (2010)	An exploratory study of the use of a problem posing of pre-service elementary education teachers' mathematical creativity, beliefs, and anxiety.	Elementary Pre-service teachers 32	<ol style="list-style-type: none"> 1. It was found that mathematical creativity can be fostered and sustained by problem posing. 2. Problem posing impacted mathematics beliefs positively.
Guvercin & Verbovskiy (2014)	The effect of problem posing tasks used in mathematics to mathematics academic achievement and attitudes toward mathematics	High school students 54	<ol style="list-style-type: none"> 1. Problem posing instruction significantly increased students' mathematical academic achievement. 2. Gave the students more confidence and positive attitudes toward mathematics. 3. Problem posing encouraged students to be creative, divergent and flexible in their thinking.
Guvercin, Cilavdaroglu & Savas (2014)	The effect of problem posing instruction on ninth grade students' mathematics academic achievement and retention	Grade 9 students 60	<ol style="list-style-type: none"> 1. Problem posing instruction increased students' academic achievement. 2. Higher positive attitudes toward mathematics. 3. More confidence and positive attitudes through active involvement
Haghverdi & Gholami (2015)	A study of the effect of using "What if Not" strategy in posing geometry problems	High school students 29	<ol style="list-style-type: none"> 1. Problem posing led to deeper understanding of geometrical concepts 2. Problem posing strengthened the interconnections between relevant geometrical concepts 3. Improved students' skills
Kesan, Kaya & Guvercin (2010)	The effect of problem posing approach to the gifted student's mathematical abilities	Grade eight students 64	<ol style="list-style-type: none"> 1. Increased and fostered mathematical abilities. 2. Enhanced interaction between teacher

Kojima, Miwa & Matsui (2015)	Experimental study of learning support through examples in mathematical problem posing	Undergraduates 219	and student, and makes student active in the lesson. 1. Problem posing benefited the experimental group more than the control group (i.e. experimental group posed problems with novel solutions). 2. Found that learning by posing problems was more effective.
Priest (2009)	A problem posing intervention in the development of problem solving competence of underachieving middle-year students	Year seven students 31	1.Participation in problem posing activities facilitated the re-engagement of disengaged middle-year mathematics students 2. Participation in problem posing resulted in improved problem solving competence. 3. There was increased integration of prior knowledge with new knowledge.
Walsh (2016)	Pre-service primary teachers' understanding of mathematical problem posing and problem solving: Exploring the impact of a study intervention	Pre-service primary teachers 415	1.Improved students' conception of what constituted a mathematical problem
Xia , Lu & Wang (2008)	Research on mathematics instruction experiment based on problem posing	Junior high school and grade nine students 540	1. Found significant effects on students' interest in learning mathematics. 2. Problem posing improved students' ability to pose problems. 3. Enhanced students' mathematics learning ability.

Results and Discussion:-

Description of the selected studies:-

A total of 16 experimental studies that made the criteria for inclusion in this study were reviewed as shown in Table 1. Nine studies were published between 2010 and 2016. Five studies published between 2000 and 2009, one study published in 1997 and one in 1998. These studies involved 1871 participants, made up of pre-service teachers, high school students, middle and lower grade students. All the studies employed experimental designs. Three studies used matching-only pretest-posttest control group design. Two used posttest only control group design, and the remaining eleven studies used quasi-experimental non-equivalent groups, and all were pretests-posttests control group design. The instruments used were either researcher constructed or adoption/adaption from the literature. The research targets of these studies were either on performance in mathematics, mathematics achievement in academics or attitudes and beliefs toward mathematics. The researchers were interested in determining the impact of problem posing as an instructional strategy on the performance of students, the achievements of students and attitudes of students toward mathematics. The summary of the outcomes or results of their findings is presented in Table 1. It can be seen from Table 1 that all the studies presented showed positive improvements in either performance in mathematics, achievement in mathematics or attitudes toward mathematics using problem posing as an intervention in the teaching and learning of mathematics.

Eight studies focused on effect of problem posing on mathematics performance and achievement (e.g. Abu-Elwan, 2002; Akay & Boz, 2008; Demir, 2005;Guvercin, Cilavdaroglu &Savas, 2014), and findings from these studies showed significant improvements in students' performance and achievement in mathematics. Two studies showed

that problem posing could foster and sustain mathematical creativity, enhance divergent and flexible thinking in students. In a study titled, 'Problem posing as a means for developing mathematical knowledge of prospective teachers', Lavy and Shriki (2007) pointed out that problem posing enhanced mathematical creativity, and this was corroborated by Singer, Ellerton and Cai (2013). They said that problem posing enhances creativity, adds to mathematical ability and learning independence.

Regarding attitudes and beliefs toward mathematics, six of the studies reviewed indicated that problem posing as an intervention impacted positively on the attitudes and beliefs of students toward mathematics (e.g. Xia, Lu & Wang, 2008; Akay & Boz, 2010; Demir, 2005; Fetterly, 2010; Guvercin & Verbovskiy, 2014). Pittalis, et al (2004) had pointed out that problem posing increased students' attitudes positively toward mathematics. Furthermore, the review revealed that problem posing helped students to understand the concept of what a 'problem' is, and to find missing information in the given problems. A study by Cankoy & Darbaz (2010) revealed that the participants in the treatment condition were better off than those in the control condition in terms of problem understanding. And also, the experimental group was better in identifying missing information in given problems than the control group. These authors' focus was determining the effect of a problem posing based problem solving instruction of understanding problem. The need for a problem solver to understand the problem he/she is to solve is imperative; and in fact, it is the first step toward a successful solution. The students were not only able to find missing information in a given problem, but also could detect contradictions of a problem. Walsh (2016) focus was on understanding mathematical problem posing and problem solving, using problem posing intervention. The study findings revealed that the problem posing intervention improved students' conception of what constituted a mathematical problem.

The study of Haghverdi and Gholami (2015) focused on skills in mathematics. The findings of their studies showed that problem posing improved students' skills in mathematics significantly. In fact, besides the improvement of skills, problem posing instruction strengthened interconnections between relevant geometrical concepts, and led to a deeper understanding of geometrical concepts (Haghverdi & Gholami, 2015). Another benefit of problem posing according to Kesan, Kaya & Guvercin (2010), is that it enhanced interaction between teachers and students, and this led to students being active in the lesson. Furthermore, an increase in the integration of prior knowledge with new knowledge was what Priest (2009) found. He also reported that problem posing activities facilitated the re-engagement of disengaged middle-year mathematics students. His study was on problem posing intervention in the development of problem solving competence of underachieving middle-year students. The intervention was reported to have improved the students' problem solving competence.

Conclusion:-

The findings of the empirical studies examined in this study can be grouped or categorized into the 3 Bloom's taxonomy of learning domains (cognitive, psychomotor and affective domains). The studies revealed that problem posing impacted positively on the following learning outcomes viz- knowledge-based, ability-based, skill-based and attitude/interest and belief-based. This shows clearly that every aspect of learning mathematics can be supported by problem posing instruction. For instance, the studies by Abu-Elwan (2002), Akay and Boz (2008), Cankoy and Darbaz (2010), Guvercin and Verbovskiy (2014), and Walsh (2016) indicated that problem posing intervention supported knowledge-based learning outcome. Similarly, studies by English (1997 & 1998), Abu-Elwan (2002), Xia, Lu, and Wang (2008), Fetterly (2010), and Kojima, Miwa and Matsui (2015) revealed that problem posing instruction impacted positively on ability-based learning outcome. Skill-based learning outcome was seen to have improved significantly through the use of problem posing (Abu-Elwan, 2002; English, 1997; Priest, 2009). Problem posing instructional strategy also improved participants attitudes/interest and beliefs toward mathematics (Demir, 2005; Akay & Boz, 2010; Guvercin, Verbovskiy, 2014 Guvercin, Cilavdaroglu & Savas, 2014).

It could be said with every confidence that, if properly handled, problem posing instructional strategy can be one of the most effective strategies in the teaching and learning of mathematics. This is because not only students benefit from problem posing; but teachers also do. Problem posing affords teachers the opportunity to get an insight into students' thinking processes. Problem posing revealed that mathematics anxiety and fears could be reduced significantly in students. It encourages the use of diverse representations, building of a knowledge network, development of creativity, enhancement of attitude toward mathematics and increment in self-confidence. It can safely be advocated that problem posing be an integral part of the mathematics curriculum, considering the role it can play in the teaching and learning of the subject.

Abstract

Zinsser Cole Engmansyndrome also known as dyskératosiscongenita (DC) is a very rare genetic affection characterized by the association of reticular hyper pigmentation, nail dystrophy and leucoplakia of the mucous membranes. We report the case of a 14 years old child already diagnosed with DC and which was complaining about extensive caries, and teeth loss. Clinical examination revealed a poor oral hygiene, extensive caries and periodontal disease. DC is a inherited bone marrow failure characterized by excessively short telomeres in highly proliferative tissues. Its prevalence is estimated at one in a million. DC has many clinical features and oral manifestations. It has a poor prognosis and its current treatment remains non satisfactory. DC needs a multidisciplinary approach and a regular follow-up.

Introduction:-

Zinsser Cole Engmansyndrome also known as dyskératosiscongenita (DC) is a very rare type of ectodermal dysplasia. It's a multi-system disorder whose symptoms appear in childhood and leads to death between 16 and 50 years.

DC occurs mainly in young male with a male to female ratio of 13/1 and mostly appears between 5 and 12 years [1-2].

This genetic affection is typically characterized by the association of a traditional dermatological triad: Reticular hyper pigmentation, nail dystrophy and leucoplakia of the mucous membranes. The medullary insufficiency associated to this disease in 85, 5% is responsible for opportunistic infections [3].

Case report:-

A 14 years old male teenager was admitted to both departments of pediatric of Casablanca University following extensive caries, teeth loss and toothache.

Medical history revealed that he's diagnosed with dyskeratosis congenital after genetic and telomere length testing provided the identification of telomere disorder.

Corresponding Author:- NAJL. Youssef.

Address:- Department of Oral Surgery, dental college, University Hassan 2 Casablanca, Morocco.

He was lately admitted for chronic mucocutaneous candidiasis and an abscess of the right buttock. The patient suffers also from growth retardation. His skin was thin, dry and wrinkled in some areas and he showed nail dystrophy of the hands and feet. (Fig 1, 2 and 3).

Figure 1: Growth retardation and thin skin

Figure 2 and 3 : Nail dystrophy of the hand and feet

His obstetrical antecedents were without particularities and his birth weight was 4 kg without signs of suffering of any neonatal infection. His vaccination was carried out correctly according to the national immunization program, without any complication.

Family history revealed that he was born from a consanguineous marriage of second degree and that his brother which was also diagnosed with DC died 3 years ago from a lethal infection.

Extra oral examination showed facial deformity with reticular hyperpigmentation of his face and neck. The patient was pale but vital signs were within normal limits (Fig 4).

Figure 4 : Facial deformity with reticular skin hyperpigmentation

Intra oral examination revealed poor oral hygiene, leukoplakia on the tongue and the mandible gingival mucosa, extensive caries of all his first permanent molars. The patient suffered from periodontal disease which led to many early teeth loss (Fig 5).

Figure 5: Extensive caries of the first permanent and leukoplakia in the mandible gingiva

Radiographic examination, showed a bone radiolucency image around the permanent molars and the two central incisors (Fig 6).

Figure 6: Bone radiolucency image around the permanent molars and the two central incisors

Periodontal treatment was performed and the first molars with the two incisors were removed. A dental prosthesis has been made and the child was very happy to find his lost smile.

Discussion:-

DC is a rare inherited bone marrow failure characterized by excessively short telomeres in highly proliferative tissues. Its prevalence is estimated at one in a million [2-3].

Five genes have been identified, all encoding for components of telomerase and involved in maintaining telomere length: DKC1 (locus Xq28, sex-linked transmission), TERC (locus 3q21-q28, autosomal dominant), TERT (locus 5p15.33, autosomal dominant), NOP10 (locus 15q14-q15, autosomal recessive) and TIN2 (locus 14q12, autosomal dominant)[4].

DC is a very polymorphous disease at the clinical level, with several modes of inheritance. Several clinical symptoms of the disease can appear after a latency period. These features make DC particularly difficult to diagnose.

The main clinical features of this multi-system bone marrow failure disease are mucocutaneous abnormalities (cutaneous hyperpigmentation, dystrophy of the nails, leukoplakia of the oral mucosa), haematopathies (pancytopenia 50%) and an increase predisposition to cancer.

Other abnormalities in other systems may also be associated: pulmonary disease fibrosis, abnormalities of pulmonary vasculature, eye defects like conjunctivitis, blepharitis, pterygium and epiphora, mental retardation, short stature, hair loss/grey hair/sparse eyelashes, eye defects and deafness [5].

The oral manifestations described in the literature are: Hypodontia, Short blunted roots, Extensive caries lesions, Delayed eruption, Taurodontism, Gingival inflammation with oedema, Alveolar bone loss, Periodontitis, Thin enamel gingival recession, Smooth atrophic tongue mucosa, Dry mouth, Angular cheilitis and Leukoplakia [3–6–7]. General hygiene recommendations include brushing teeth two to three times a day with fluoridated toothpaste and flossing once a day at a minimum to help prevent tooth decay. Some dentists recommend using prescription strength fluoridated toothpaste or antibacterial mouth rinse to aid in reducing oral disease.

Biannual dental checkups and cleanings are recommended to monitor for the presence of oral pathology and prevent the development of significant dental decay and gum disease.

Precautions during routine dental treatment may be necessary in the presence of low platelet counts and white blood cell levels.

Access to quality dental care for medically compromised patients may be challenging outside of large urban centers.

The risk of squamous cell carcinoma is high in individual with DC estimated approximately 35%, with a peak in the third decade. Many other malignant tumors and hemopathies have also been reported like bronchial, colon, larynx, esophagus, stomach and pancreas carcinomas, Hodgkin's disease and leukemia [3].

Malignant degeneration of these leukoplakia is not uncommon and it's expected after 10 to 15 years of evolution, hence the need for periodic reviews to detect signs of transformation.

DC has a poor prognosis, the current treatments remain non satisfactory.

Mortality is often associated to severe pancytopenia, development of malignancy and other multisystem complications of the disease [2].

Conclusion:-

DC needs a multidisciplinary approach: genetic, pediatric, hematologic and a special dental care. Regular follow-up of the patient is essential especially with the high possibility of malignant changes within oral and other mucosal sites.

Abstract

Introduction- Brunner's glands are located in the submucosa of the duodenum in all mammals. The principal function of the glands is thought to be protection of the duodenal mucosa against the erosive effects of the gastric juice by virtue of the mucoid nature of its secretion, its alkalinity, and possibly by the buffering capacity of its bicarbonate content. In the present study postnatal development of Brunner's glands in the rabbit was observed in 21 rabbits.

Material & methods- This research work was done during the period between 1977-1979 as a part of thesis work. The present work, postnatal development of the duodenal submucosal glands in the four parts of the duodenum was studied in rabbit. Method-For postnatal developmental study of Brunner's glands in rabbit animals were used either the littermates or the young ones of the same parents. Rabbits of 0hrs, 1 week, 2 weeks, 3 weeks, 4 weeks, 5 weeks, and 6 weeks age formed one series. Three such series were examined. Four pieces were taken from first, second, third and fourth part of duodenum and placed in fixative 10% formal saline. Tissues were processed routinely and stained with: haematoxylin and eosin for light microscopy.

Results- The origin and development of Brunner's glands in the rabbit have been studied in postnatal animals. Brunner's glands arise principally from the bases of crypts of Lieberkuhn. The glands commence as buds which proliferate deep into the submucosa and branch to give rise to tubules and to a duct system. The Brunner's glands in rabbit extended up to the second part of duodenum at birth and their extent gradually increased distally. By the end of second week the glandular tissue reached the fourth part of duodenum. The glands were more in the proximal part of duodenum and decreased from the proximal to the distal part. Compactness of glands when traced at weekly intervals in the identical parts of duodenum showed marked increase up to sixth week. The serous cells were differentiated in the terminal portions of tubules at birth but mucous acini started differentiated only after two weeks.

Introduction:-

The duodenal glands or the glands of Brunner are present in all mammals and are believed to secrete an alkaline fluid containing mucin. The duodenal glands were first observed in 1679 by Wepfer¹ who described them during the autopsy. Wepfer¹ described their arrangement in the duodenum and observed that when they were macerated in water, the duodenal glands discharged copious amounts of mucus. Nine years later, Brunner^{2,3} who was Wepfer's son-in-law, described the duodenal glands in the horse, ox, sheep, deer, dog, and beaver and presented a brief description in man. Brunner considered these glands to be accessory pancreatic tissue and termed them "glandulae duodeni" or "pancreas secundarium." Middeldorpf⁽⁵⁾ realized that the secretion of the duodenal glands differed from that of the pancreas and suggested that these glands be designated "the glands of Brunner." Florey and Harding^(6,7) found that the region of the duodenum containing the duodenal glands is more resistant to acid erosion than other regions of the small intestine. Grossman⁽⁸⁾ in 1958 has reviewed the literature with regard to these glands and recent studies Moe, 1960;⁽⁹⁾, Cochrane, Davies, Palfrey & Stockwell, 1964;⁽¹⁰⁾ Friend, 1965;⁽¹¹⁾ Leeson & Leeson, 1966⁽¹²⁾ have reported upon the fine structure of the glands in cat, guinea-pig, mouse and rat respectively. The latter studies have emphasized species differences. In the cat and in the mouse, gland cells possess features intermediate between those of mucous and serous cells. Component cells of the glands in the guinea-pig are typically mucous in type and in the rat cells appear to be more mucous than serous with regard to their fine structural appearance. Little work has been reported on the development of Brunner's glands. Barth(1868)⁽¹³⁾ reported that in the rabbit the duodenal glands sprout off from the crypts of Lieberkuhn as double outgrowths. In man, the glands first appear at approximately 78 mm (3 months) (Brand, 1877;⁽¹⁴⁾ Johnson, 1910⁽¹⁵⁾) and arise from the bottoms of the crypts of Lieberkuhn. The glands develop in a progressive fashion starting in the upper one-third of the duodenum and extending downward so that in the 120 mm stage the greater part of the duodenum contains glands of Brunner. As the glands develop they branch several times, each branch becoming arranged into a lobule. The present paper reports upon the postnatal development of the Brunner's glands in the rabbit.

Material and methods:-

This research work was done during the period (1977--1979) as a part of thesis work. Twenty one rabbits divided into seven specific age groups were used in this study. For postnatal developmental study of Brunner's gland in rabbit, animals were used either the littermates or the young ones of the same parents. Rabbits of 0 hrs, 1 week, 2 weeks, 3 weeks, 4 weeks, 5 weeks, and 6 weeks age formed one series. Three such series were examined. The animals were anesthetized by giving ether. Entire duodenum was removed from pyloro duodenal junction to duodenojejunal junction in each rabbit. Four pieces were taken from first, second, third and fourth part of duodenum and placed in fixative 10% formal saline. Tissues were processed routinely and stained with Haematoxylin and Eosin for light microscopy.

Results:-

Postnatal development of Brunner's gland in four parts of duodenum was studied in rabbits from birth (zero hour) upto six weeks of life.

Zero Hour-Tubular structures lined with stratified cuboidal epithelium having two cell layers were scattered in the sub-mucosa throughout its circumference in the first part of duodenum. Branching of tubules and their continuity with deeper parts of intestinal glands was seen at places (Fig.1). Related with the tubules, ill defined serous acinar cells were evident. Similar tubular structures but in reduced number were also seen in the submucosa of second part of duodenum and were not seen in the submucosa of third and fourth part of duodenum at all. Muscularis mucosae was seen as a fine interrupted streak like structure.

First Week-Tubular structures were seen in the greater number than that at zero hours in the submucosa of first and second part of duodenum. Few tubular structures were also seen in the submucosa of third part of duodenum but were not seen in the submucosa of fourth part of duodenum. Muscularis mucosae was seen as a thin interrupted line.

Second week-Tubular structures were seen in the increased number in the submucosa of first, second and third part of duodenum than that at first week. Few tubular structures were also seen in the submucosa of fourth part of duodenum also. (Fig.2)

Third Week-Glandular tissue in increased number with well differentiated acini were seen in the submucosa of all

parts of duodenum. In the first part well differentiated mucous acini were more in number (Fig 3) while in second and third part serous acini were more than mucous acini and only serous acini were seen in fourth part (Fig.4). In the first part glandular tissue was more dense. Ducts of the gland lined with simple cuboidal epithelium and opening into the deeper parts of intestinal glands were also seen. Well developed muscularis mucosae was observed in all parts.

Fourth Week-Well differentiated glandular tissue with increased quantity were seen in the submucosa of all parts in comparison to that at third week (Fig 5). It was most dense in first part and very less in fourth part. There was predomination of mucous acini in the first part and of serous acini in the second, third and fourth part. In the fourth part mucous acini were rarely seen.

Fifth week-Glandular tissue in the submucosa was more in comparison to that at four weeks in all parts. Predomination of mucous acini was observed in the first part and of serous acini in the third part and fourth part while of both mucous and serous acini in second part.

Sixth week-Glandular tissue in the submucosa was more in comparison to that at fifth week in all parts. Glandular lobules were seen in the submucosa as well as in the lamina propria of first part of duodenum (Fig 6). Gradual decrease in density was observed in distal parts of duodenum. Predomination of mucous acini in the first and second part of duodenum (Fig.7) and of serous acini in the fourth part (Fig 8) was seen. While in the third part mucous and serous acini were almost in equal proportion.

Discussion:-

In the present work postnatal development of Brunner's glands were studied in rabbits from birth to six weeks of age. The Brunner's gland in the rabbit at birth was represented by two cell layered tubular growth from the deeper parts of intestinal gland, branching into the submucosa in the present study (fig.1). The Brunner's glands in rabbit extended upto the second part of duodenum at birth and their extent gradually increased distally. By the end of second week the glandular tissue reached the fourth part of duodenum (fig.2). Obouforibo and Martin⁽¹⁶⁾ (1977) also described similar stage of glandular tissue in the newborn mouse. Krause and Leeson⁽¹⁷⁾ (1967), however mentioned that rat possessed all the mucosal constituents of duodenum at birth and it only differed in the extent and degree of differentiation of various structures in adults. The duodenal glands in the golden hamster developed on the first day after birth (Mann et al. 1967)⁽¹⁸⁾ and reached functional maturity by the fifteenth postnatal day. Woff⁽²²⁾ (1961) found that glands first appeared near the pylorus and developed pari passu with the duodenum. Krause and Leeson (1967)⁽¹⁷⁾ working on rat, also mentioned that the development and differentiation of Brunner's gland followed a progressive pattern, slowly extending down the duodenum till the final distribution was reached. Adult stage was achieved by third week in mouse (Obouforibo and Martin, 1977)⁽¹⁶⁾. With the increasing downward extent, the compactness of glands in the proximal part was found to be increased in the present work. Similar observations were found by Obouforibo and Martin (1977)⁽¹⁷⁾ in the mouse. Mohammadpour, A. A., (19) also found in the guinea pig the glands were well developed in the cranial part of duodenum. There was a significant difference in the thickness of duodenal submucosal glands in all parts of the duodenum that decreased from the cranial to the ascending part. In the present study compactness of glands when traced at weekly intervals in the identical parts of duodenum showed marked increase upto sixth week (fig.4 & 6). Obouforibo and Martin (1977)⁽¹⁷⁾ mentioned that the growth rate of glands in mouse was found to be diminished after third week. Cooke (1967)⁽²⁰⁾ mentioned that the serous cells differentiated a day before birth and mucous cells were four to five days after birth. In the present study also the serous cells were differentiated in the terminal portions of tubules at birth (fig.1) but mucous acini started differentiated only after two weeks. Gabe (1956)⁽²¹⁾ showed that all the cells of submaxillary glands were serous at birth and five days after changed to mucous type. In the present study no such things were found.

Florey and Harding (1933)⁽⁶⁾ and Cooke (1967)⁽²⁰⁾ mentioned that the secretion of the Brunner's glands being alkaline in nature protected the duodenum from ulceration by acid pepsin. In the present study at sixth week predomination of mucous acini in the first (Fig.6) and second part of duodenum (Fig.7) and of serous acini in the fourth part (Fig 8) was seen. While in the third part mucous and serous acini were almost in equal proportion. So the proximal part of duodenum showed large proportion of mucous acini as compared to the distal part. This could be correlated to the greater need of alkalinity in the vicinity of pyloric region which is the first to receive the acidic content of the stomach.

- c) muscularis mucosae

Conclusion:-

Postnatal development of Brunner's glands in the rabbit were studied Total twenty one rabbits were sacrificed. The Brunner's gland in the rabbit at birth was represented by two cell layered tubular growth from the deeper parts of intestinal gland, branching into the submucosa of first and second of duodenum By the end of second week the glandular tissue extended to the fourth part of duodenum. Compactness of glands when traced at weekly intervals in the identical parts of duodenum showed marked increase upto sixth week The serous cells were differentiated in the terminal portions of tubules at birth but mucous acini started differentiated only after two weeks .At sixth week predomination of mucous acini in the first and second part of duodenum and of serous acini in the fourth part was seen while in the third part mucous and serous acini were almost in equal proportion This could be correlated to the greater need of alkanity in the vicinity of pyloric region which is the first to receive the acidic content of the stomach.

Abstract

Corporate sector being one of the many investors in a corporate structure, it has been surveyed that all the companies possess Policies and practices of Corporate Social Responsibility (CSR). In the process of design and implementation of CSR by taking initiatives in the area of work, covers the entire community. Moreover, it has been unearthed that many companies carry out the promotion and implementation through Human Resource Department, in collaboration with NGOs but a full fledged CSR department. Nevertheless, CSR enterprises undertaken by the Indian companies for rural development created a positive impact on the inclusive development of business and society at large.

Copy Right, IJAR, 2017. All rights reserved.

The vast majority of the poor in India has been gripped in the state of neglect and underdevelopment. The problems of illiteracy, mortality rate, ignorance, poor health and hunger are more serious issues in rural areas than in urban. The reason being merely, lack of equipment resources and defective planning investment process and model. India does have a potential to meet these tests in rural areas provided government efforts are sufficient to provide basic services to its citizens. It is alarmingly recognized that the progress and welfare of society is not just the responsibility of government rather other stakeholders also must give hand to achieve the goal of development.

The concept of CSR took birth basically in western world out of the public retort for the new stages of power and freedom that was acquired by transnational sectors due to continuous neo-liberal economic policies which were in practice in 1980s and 1990s initiated by the governments, then. Subsequently, the citizens of these nations felt discomfort with the mounting power of corporations when the media started exposing a few negative environmental and social impacts that the large chunk of Western owned corporations had in developing countries. Consequently, some academics, government agencies and development organizations thrust the responsibility on the part of corporations with a solution to lessen few of the negative impacts which would cater to contribute more to socio-economic development in its largest sense.

Thus, the corporate sector does have an important role to play in ensuring that the private investment must reach these rural areas which have been neglected and remained out of development endeavour till now and looking forward to sustained development in rural areas, too. Surprisingly, many companies resulted in supporting the concept of CSR with the title of business of profit with due social responsibility. Very soon later the companies voluntarily decided to join hands with society to make it a cleaner and better environment (European Commission, 2001). Therefore, making CSR as "The commitment of businesses to contribute to sustainable development as well as to economic development by working with employers, their families, local community and society as a whole and

improve their quality of life, so that it is good for business and for development. A widely-cited definition by the World Business Council for Sustainable Development the state of development that "Corporate Social Responsibility is the continuing commitment by business to behave ethically and contribute to economic development while improving the quality of life of workers and their families and the local community and society at large." (WBCSD, 1999)

Therefore, to define the CSR two folded, it could be stated that firstly, it offers ethics to the organization to practice for its inner and outer employees. Furthermore, it also makes the organization realize its responsibility towards the environment and the society in which it functions. Companies consider CSR as a means of giving the society its due returns. Undoubtedly, it is quite important to study and understand businesses and how they initiate CSR by creating their impact of activities in the domain of socio-economic development of the rural population. It is a mission to contribute innovative solutions to the environmental and social challenges. In order to identify the priorities and the CSR inventions in regard to rural development sector by the professional community, certain parameters must be drawn:

1. The objectives of CSR must be aligned with the Millennium Development Goals (MDGs).
2. The companies must create divisions assigned for CSR by comprising them with well qualified, well trained and well experienced professionals coming from social science background, Rural Development and Development Studies for better planning, application and evaluation.
3. CSR programmes which are to be put to action by the Indian companies must be founded on the felt needs of existing population through which their participation can be enhanced. Moreover, it should also be implied that the jobs are created by way of economic activities in the rural community to better their lives.
4. The performance of CSR of a company must come under social audits by external source agencies.
5. It would be unfair on the part of government to act just like a director of CSR. Rather, the government must take charge of being a facilitator, promotor and a catalyst to encourage the big players of the business world asking them to take into account the ethical, environmental and social issues of the country.
6. In order to highlight the company commitment to sustained development of the community, an annual report must be prepared on social responsibility.

It has been observed that companies have designed the policies of practicing CSR. A wide range of CSR initiatives which are designed and implemented ranges from agriculture development, drinking water management, development of natural resources, income generation schemes, health check-up and camps, health services on wheels, general and adult education and infrastructure services established by such companies. Although the manner of working is changing from philanthropic development to sustainable welfare, there doesn't seem to be any relation between company CSR plan and the Millennium Development Goals. It has also come to light that the companies carry out CSR initiatives through Human Resource Department, in collaboration with NGOs. There is an absence of full-fledged Corporate Social Responsibility department.

Thus, to conclude, CSR is surely considered as a vital issue of Indian companies no matter what its size, sector and objective or location is. Moreover, the Indian companies have realized that stability and sustainability of economic activities to compete with global market is not possible without socio-economic development of local communities. It has definitely resulted in the positive effect and impact on the overall development of society and business.

Key words:-

Water chestnuts, Fox nuts, Product development, Nine point hedonic scale.

Abstract

Background: The idea of incorporating of flour being nutritionally rich fulfills the requirement of healthy snacks. As protein and vitamin deficiencies are very common in India, efforts are underway to enrich cereals, in supplements with, vegetable used in effective manner.

Aim: The objective of the study is to evaluate organoleptic attributes, nutritive value and cost of prepared food product.

Methods: The products were organoleptically evaluated for the colour and appearance, body and texture, taste and flavour and over all acceptability using Nine point Hedonic scale. Nutritional composition was determined using the standardized AOAC (2005) methods.

Statistical analysis: The data were statistically analyzed by using analysis of variance technique, critical difference test.

Results: On the basis of findings, it was observed that in context with organoleptic attributes, treatment T₂ was best as compared to control and other treatments, however all the treatments were found acceptable. Nutrient composition of *Pua* treatment T₂ was rich in Protein (7g/100g), Carbohydrate (66g/100g) and Iron content (2mg/100g). Average cost of the *Pua* per 100g of raw ingredients was Rs. 13.25 for T₀ (control), Rs.17.25 for T₁, Rs. 19.25 for T₂ and Rs. 21.25 for T₃.

Conclusion: Incorporation of flours of Fox nuts and Water Chestnuts in *Pua* is well acceptable and can be used for the development of food product.

Introduction:-

The idea of incorporating of flour being nutritionally rich fulfills the requirement of healthy snacks. As protein and vitamin deficiencies are very common in India, efforts are underway to enrich cereals, in supplements with, vegetable used in effective manner (Pragati and Paul, 2010).

Fox nut or Gorgon nut, commonly known as *Makhana*, Popped *Makhana* is used in preparation of a number of delicious and rich sweet dishes, pudding and milk based sweets. Fox nuts are low in calories, fat (saturated fats) and sodium and high in magnesium, potassium, phosphorus and fiber. They have antioxidants properties and good food for diabetics, arthritis, kidney diseases, constipation, diarrhea, cancer, anemia, heart problems. It improves appetite, moisture level in body tissues and prevents the inflammations in the body. It helps the body to remove the waste and thus prevent the accumulation of toxins. It also contains useful medicinal properties (Das *et al.*, 2006).

Water chestnut (*Trapa Bisinosa Roxburg*) commonly known as “Singhara”, is an annual aquatic warm season crop. They are almost fatless and are therefore, a healthy food option. Ground water chestnut powder mixed with water can relieve cough. Boiling water chestnuts in water makes the best drink for measles patients and is appropriate for all measles patients from the third day till the ninth day of the cycle. It helps to speed up the measles cycle. They are good sources of calorie, carbohydrate, dietary fiber, vitamin B6 and also contain fair amount of calcium, potassium, iron and zinc. Water chestnut used for many therapeutic purposes e.g. for jaundice, measles, cough and summer heat etc (*Masrizal et al., 1997*).

The study was carried out to develop pua by incorporation of flour of fox nuts and water chestnuts, to evaluate the organoleptic acceptability of the prepared product and to determine the nutrient composition of the prepared product.

Methodology:-

The present study was conducted in Sam Higginbottom University of Agriculture Technology and Sciences, Allahabad.

Procurement of Raw Materials:-

The required materials i.e. Fox nuts and water chestnuts, Bengal gram flour, sugar, cardamom, coconut powder, coco powder, refined oil and vegetable etc were collected from local market of Allahabad city.

Preparation of fox nuts and water chestnuts flour:-

Fox nuts and water chestnut was Cleaned, after that Sun drying was done for one day, then fox nuts and water chestnuts was Grinded, then Fox nuts and water chestnuts flour was Packed (Airtight tin containers or polythene bags) and Storage (At ambient temperature in dry place) **Srivastava and Kumar (2009)**.

Control and three experimental treatments were prepared as follows:-

T₀ (Control): In this, the standardized recipe was followed to prepare the products without any incorporation fox nuts flour.

T₁ (90%, 10%): In this treatment, 90 percent Water chestnut flour and 10 percent Fox nut flour to prepare products.

T₂ (85%, 15%): In this treatment, 85 percent Water chestnut flour and 15 percent Fox nut flour to prepare products.

T₃ (80%, 20%): In this treatment, 80% Water chestnut flour and 20 percent Fox nut flour to prepare products.

Replications: All the treatments of the four products respectively were replicated four times to get average values.

Organoleptic Evaluation:-

Sensory evaluation of the Pua for their acceptability was done by a panel of judges. Colour, Texture, Flavor, Taste and Overall acceptability were evaluated using the nine point hedonic scale based score card. (**Srilakshmi, 2003**).

Calculation of Nutritive Value of Prepared Products:-

The nutrient composition of the value added product were determined by **AOAC method (2005)** to estimate the moisture, total ash, protein, fat, carbohydrate, iron and calcium content.

Cost of prepared products:-

The cost of the products was calculated on the basis of price of raw ingredients at rupees/kg.

Nutrient/100gm of product:-
$$\frac{\text{Ingredient used (g.)} \times \text{nutritive value of ingredient}}{100}$$

Statistical analysis of the Products:-

Data is ascertained from the experiment was statistical analyzed using analysis of variance technique and critical difference test (**Fisher, 1995**).

Results and Discussion:-

Average Sensory Attributes Of Value Added Pua.

Figure 1:- Average Sensory Score for Different Treatments of Pua

Figure 1 shows the mean scores of *Pua* in relation to overall acceptability indicates that the treatment T_2 (8.89) has the highest score followed by T_3 (8.60), T_1 (8.01) and T_0 (7.66) respectively, making quite obvious that the incorporation of 85 percent water chestnut flour and 15 percent fox nut flour showed the best result for overall acceptability. Therefore, it can be calculated that there was significant difference between the treatments for overall acceptability of *Pua*. All treatments were acceptable on 9 point Hedonic scale and liked very much by the panel of judges.

Kumari and Paul (2012) studied the incorporation of coarse grain bajra flour and chick pea flour into the traditional recipe *Pua*. The result shown that the treatments T_3 were most acceptable among all the treatment they obtained a mean score of 6.92, 7.6, 7.68 and 7.42 for colour, body and texture, taste and flavour and overall acceptability.

Nutrient Composition Of The Product:-

Table 1:- Mean nutrient composition of the *Pua* developed by incorporation of flours of water chestnuts and fox nuts (per 100 g).

Product/ Treatments	Moisture (g)	Ash (g)	Fat (g)	Protein (g)	CHO(g)	Calcium (mg)	Iron (mg)
Pua T_0	12.64±1.12	22.07±0.43	15.85±0.92	4.12±0.08	60.23±0.34	30.28±3.24	1.16±0.03
T_2	8.20±0.28	22.36±0.39	14.37±0.51	7±0.19	66.10±0.87	28.11±2.19	1.64±.43

A wide range of variation was observed in the nutrient content of the product and treatment. T_2 was found to be the best treatment among all the treatments. Therefore along with T_0 , nutrient composition of T_2 was determined. Results from the table 2 shows that the moisture content was highest in pua T_0 (13g/100g), Ash content was highest in T_2 (23g/100g), Fat content was T_0 (16g/100g), protein content was T_2 (7g/100g), in carbohydrate content was T_2 (66/100g), calcium content was T_0 (30mg/100mg) and iron content was highest in T_2 (1.64)

The result is supported by the findings of **Singh et al., (2009)**. The *Pua* is prepared with the incorporation of bajra flour, maize flour in whole wheat flour. Protein content increased as the incorporation level of bajra and maize flour increased. Fat content was lowest in T_0 (51.07 g), followed by T_1, T_2, T_3 . Calcium content was highest in T_2 (112.45 mg), followed by T_3, T_2, T_1 and T_0 and carbohydrate content as the amount of bajra and maize flour increased. Iron

content was found highest in T₀ (12 mg), followed by T₁, T₂, T₃. Moisture content was high in T₃ (13.45), followed by T₂, T₁ and T₀.

Cost Of Raw Ingredients:-

The cost has been calculated on the basis of prevailing price of raw materials. It is evident that the cost of *Pua* T₁ was lowest i.e. (17.25 Rs/100g) as compared to experimental *pua* samples, T₂ (19.25 Rs/100g) and T₃ (21.25 Rs/100g). The cost of the developed product is increasing due to incorporation of water chestnut and fox nut flour at different levels.

Conclusion:-

It is concluded that incorporation of flour of water chestnuts and fox nuts in product like *Pua* is well acceptable. In *pua* T₂ (85percent water chestnuts flour + 15percent fox nuts flour) was the best on all sensory parameter. For *Pua* treatment T₂ (85percent water chestnut and 15percent fox nut flour) was rich in protein (7g/100g) and carbohydrate content (66g/100g). The lowest cost of the developed food product per 100g of raw ingredients was Rs-13.25 for *Pua* of the treatment T₁.

Chemical and natural coagulants; pH;
Cactus; Turbidity; Coagulation-
flocculation

Abstract

Observing the need for clean water and recycling of wastewater through effective treatment to help counter the continued water scarcity facing Kenya, the study sought to explore the possibility of using cactus in the coagulation-flocculation process. The study employed an analytic literature review model, sourcing recent and authoritative studies to investigate the effectiveness of cactus plants as coagulants, and the involved pH implications. The findings indicate that plant-based coagulants such as cactus are being considered as alternatives to conventional synthetic chemical coagulants in aspects such as costs, health effects, non-biodegradability, altered pH in post-treatment water and corrosion and transmission problems. In addition, cactus appears to have no significant effects on the pH of treated water. However, the findings demonstrate a lack of consensus regarding the optimal pH at which cactus is best effective in coagulation.

Introduction:-

Today's rapidly growing populations outstrip available water resources, which is especially problematic in developing countries that may be on the verge of water scarcity. In the context of limited water resources and water scarcity, water treatment and recycling procedures constitute one of the alternatives to obtain potable water in future. It is therefore necessary to develop suitable, rapid, and inexpensive water and wastewater treatment methods to remove turbidity, coloration, and heavy metals among other contaminants (Gupta et al. 2012). Such an approach to water treatment should also take into consideration contributions to environment and sustainable development. Wastewater treatment primarily entails the coagulation-flocculation process, which is a widely employed

physicochemical treatment approach. Traditionally, synthetic inorganic chemicals such as alum and ferric chloride have found wide use as coagulants and flocculants (Nilsen *et al.*, 2005). However, the use of such conventional synthetic chemical coagulants raises environmental, safety, and sustainability concerns, surrounding aspects such as high procurement costs, possible human health risk concerns, their effects on the final pH of the treated water, and non-biodegradability which have detrimental environmental concerns (Yin 2010). These issues have led to the pursuit of alternative coagulants in wastewater treatment, with plant-based coagulants emerging as potential replacements. Such natural coagulants bear much promise in delivering effective wastewater treatment while responding to environmental and sustainability considerations.

In the Kenyan context, wastewater treatment is pertinent because the country has a water scarcity problem, with over 80% of its land considered arid and semi-arid (Patel, 2013). The country has a freshwater per capita of only 647m³, which is well below the United Nations' recommended minimum (1,000m³), with projections indicating a possible decline to 235m³ by 2025. As a case example, water supply to Nairobi stands at 580,000 m³/day compared to a demand of 750,000 m³/day, underscoring the necessity of sustained huge investments to expand water supply. In a scenario in which 20 % of water supplied to the city ends up as wastewater, the wastewater volume may increase from 116,000 m³/day to 172,000 m³/day by the year 2017, and 600,000 m³/day by 2035, an amount which is equivalent to the total water supplied in 2013 (Patel, 2013). These observations demonstrate that wastewater treatment constitutes an important potential source of water to relieve the water scarcity in Kenya. However, urban municipalities currently rely heavily on conventional treatment plants, which not only have the earlier mentioned demerits, but are also inadequate, non-functional at times due to technical hitches, or entirely lacking owing to associated operational costs and capital investments (Opaa&Omondi, 2012). Such observations indicate the need for alternative coagulants in Kenya to address the weaknesses of conventional wastewater treatment to meet the water supply needs of the country.

In terms of environment and sustainability considerations, Kenya seeks to make progress on the 17 Sustainable Development Goals contained in the United Nations' 2030 Agenda (United Nations Development Programme, 2017). Pursuing alternative, natural, and effective coagulants contributes directly to one of these sustainable development goals and indirectly to a number of the other goals. In this case, goal 7 of the 2030 Agenda is to "ensure availability and sustainable management of water and sanitation for all" (Kimani, 2016). As a result, securing a locally available and inexpensive plant-based coagulant would help Kenya take significant steps towards the 2030 Agenda in the aspect of sustainable management of water and sanitation. Other goals to which alternative natural coagulants are relevant include goal 3, concerning healthy lives and wellbeing of all, goal 1 (poverty), goal 3 (improved nutrition and sustainable agriculture, and goal 10 (addressing inequality).

The possibility of using plant-based coagulants in treating wastewater would prove useful for the country in terms of such environmental, health, and sustainable development objectives, as these coagulants are generally considered to be safe to human health, inexpensive and locally available therefore affordable, biodegradable and result in low-level sludge production (Vijayaraghavan *et al.*, 2011). One such plant-based coagulant under research entails the use of cactus species, with multiple studies seeking to establish the plant's effectiveness as a coagulant. Cactus is native to Kenya making it readily available, which indicates that it bears significant promise as a natural coagulant to address the problem faced in potable water supply and sustainable wastewater treatment in the country. However, its use as a coagulant first requires an overview of its effectiveness levels and optimum conditions especially in relation to pH, which would then guide further research and use in local contexts in Kenya.

The objective of this paper is to review available scholarly work on the possible use of the cactus as an alternative coagulant through consolidating the available published literature concerning cactus' effectiveness in water treatment. The review is expected to avail information that can be useful to develop infrastructure for affordable and sustainable potable water provision in rural areas and informal sector communities of Kenya. The review will also offer technical know-how to informal settlement dwellers on the use of cactus to treat their wastewater for re-use.

Literature Review:-

The review of literature involved an analysis of published studies regarding the use of cactus-based coagulants published within the last 10 years to ensure that the insights are current and up-to-date. The review commences with studies that took some interest in the relevance of natural, plant-based coagulants such as cactus in light of the merits of such bio-coagulants and demerits of conventional chemical treatment. The next section covers the use of cactus derivatives as coagulants in water treatment, exploring their effectiveness when compared to other bio-coagulants

and conventional ones. The review then narrows to focus on studies that included investigations on the effects of pH on the effectiveness of treatment including the pH of the final treated water when using cactus-derived coagulants. The literature review concludes with an overview analysis of the findings from the scholarly.

Opportunity for Use of Cactus as a Natural Coagulant:-

According to Yin (2010), lack of proper and effective water treatment systems in rural areas of underdeveloped regions of the world necessitates the use of cost-effective point-of-use approaches. The study demonstrates how the opportunity for use of natural plant-based coagulants arises. Among the various point-of-use approaches, coagulation has found wide use in treating both surface water and industrial wastewater. Such wide application in the removal of dissolved chemicals and turbidity from water entails the use of conventional chemical-based coagulants, including alum ($\text{Al}_2(\text{SO}_4)_3$), poly-aluminium chloride (PAC) and ferric chloride (FeCl_3). However, Yin (2010) notes that these conventional coagulants are associated with demerits such as ineffectiveness in low-temperature water, high procurement costs, deleterious impacts on human health, production of large sludge volumes and significant effect on the pH of the treated water. Meanwhile, the study establishes that natural plant-based alternatives avert these shortcomings of conventional coagulants through their low cost as they are locally available, the unlikely effect on extreme pH changes and high biodegradability. This study demonstrates that cactus may be advantageous because it is not only effective, but also helps avoid the environmental impacts of synthetic coagulants, besides also providing a sustainable option towards wastewater treatment.

Feria-Díaz *et al.* (2016) make similar observations regarding the use of conventional chemical coagulants in treating surface water and wastewater. The scholars noted that such coagulants are based on inorganic salts or synthetic organic polymers, which do have various disadvantages including risk to human health, high cost, high sludge volume production, water temperature dependent and significant alteration of the treated water. Further, chemical coagulants lead to high aluminum concentration in water after treatment, which interferes with water disinfection, which poses some distribution problems, decreases transmission capacity, and generates corrosion problems. Meanwhile, the scholars noted that alternative coagulants from natural sources have advantages in their safety for human health, biodegradability, low acquisition costs, low toxicity, and low-level sludge production. These merits underscore the environmental and sustainability gains that would be made upon embracing natural coagulants in treating wastewater. The study concludes that natural coagulants are equally effective in treating water and are also unlikely to alter the pH of treated water.

Vijayaraghavan *et al.* (2011) reviewed the use of plant-based coagulants in the treatment of water and wastewater. Among the factors contributing to the interest in the use of plant-based coagulants, the scholars highlight the presence of residual monomers during the use of synthetic polymers, which are undesirable owing to their neurotoxicity and carcinogenic properties. This led to researchers getting interested in plant-based coagulants, which could solve the problem of residual monomers. The plant-based coagulants are designed as point-of-use technologies in less-developed societies, as they are relatively cost-effective when compared to their chemical counterparts. In addition, the scholars note that plant-based coagulants are also advantageous owing to the ease of processing to useable form alongside their biodegradability, translating to sustainable wastewater treatment. These bio-coagulants achieve comparable treatment efficiency to chemical coagulants when employed in treating waters that have a low-to-medium turbidity range of 50 –500 NTU. Although the scholars observed that application of the natural coagulants in industrial wastewater treatment is still in infancy, they noted that such coagulants hold much technical promise in water treatment. Cactus, Nirmali seeds (*Strychnos potatorum*), tannin, and *Moringa oleifera* are among the most studied plant-based coagulants, representing important progress in sustainable water treatment technologies.

Cactus Use in Coagulation:-

Several studies demonstrate that cactus is potentially an effective natural coagulant that is also responsive to environmental and sustainability concerns. Betatachee *et al.* (2014) compared north Algerian prickly pear cactus (*Opuntia ficus-indica*) juice with polyelectrolytes (Chimfloc C4346, Sedipur NF 102, a cationic polymer, and Sedipu AF 400) and inorganic conditioners (FeCl_3 and $\text{Al}_2(\text{SO}_4)_3$) in coagulating wastewater sludge. The study entailed a chemical characterization of the cactus juice alongside conditioning of the sludge with the juice and comparison chemicals, with analysis involving Fourier Transform Infrared spectral analysis and photometry. The findings demonstrated that the juice from the cactus promoted the coagulation of almost all of sludge, enabling liquid and solid separating and easing filtration process. Further, residual turbidity, the specific resistance of filtration and dryness obtained were comparable to those of Chimfloc C4346, and significantly better than those of Sedipur AF400

and the inorganic chemicals analyzed, with the optimum dosage for the cactus being 0.4 g kg⁻¹ of dry matter. These findings led these researchers to conclude that the juice from the prickly pear cactus could find use as a natural conditioner in treating sewage sludge.

Fig. 1:- Cactus *Opuntia* (*ficusindica*).

Rodiño-Arguello *et al.* (2015) compared five natural coagulants, *Hylocereus cf. trigonus* (cactus) stems, Campano (*Albizia saman*), exudate gum, the bark of Guácimo (*Guazuma ulmifolia*), and bark and seed from Moringa (*Moringa oleifera*) in treating raw water samples taken from Sinú river, Colombia. The scholars measured initial turbidity levels and turbidity removal efficiencies as a percent activity function for coagulant dosages at 5 mg/L to 200 mg/L. Although the Moringa extract was found to be most effective in turbidity removal efficiency and coagulation activity, the cactus also had attractive results in removing turbidity (98% turbidity removal). The aforementioned observations underscore the turbidity removal prospects of cactus extracts, demonstrating why it may find crucial use in wastewater treatment in the third world.

In another study, Fedala *et al.* (2015) evaluated the performance of *Opuntia ficus-indica* as a flocculating agent. Collecting the cactus from Tipaza, Algeria, the scholars evaluated the coagulation-flocculation performance of the cactus and the quality of the treated water through measuring residual turbidity. After measuring the effectiveness of the cactus in coagulation at different solutions, the findings demonstrated that 0.2 mg/L cactus concentration was effective for the most turbid water, achieving best removal to 0.5 NTU. The residual turbidity levels were between 0.5 and 1.2 NTU, with the results being dependent on the initial turbidity of the water. These findings led the scholars to conclude that mucilage from *O. ficus-indica* is attractive as a natural material for water treatment technologies.

Nougbodé *et al.* (2013) also evaluated the properties of cactus as a natural coagulant for water clarification, using an aqueous *Opuntia dillenii* solution to clarify highly turbid surface water (turbidity varying from 418 NTU to 186 NTU). After undertaking flocculation and coagulation tests, the scholars found that *Opuntia dillenii* was useful for

the treatment of highly turbid water. The solution had a removal efficiency varying from 89% to 93% for turbidity and suspended solids, as well as efficiency varying from 4% to 15% for obvious color using optimum values 1 mL to 10 mL. Successive addition of the natural coagulant and lime resulted in an improved elimination of turbidity and suspended solids in the water alongside the improvement of color. Removal efficiency for turbidity and suspended solids reached over 95% while that for color was between 67% and 94%. Such observations underscored the value of *Opuntia dillenii* in water clarification, with the scholars recommending that studies move beyond laboratory-scale settings.

Sellamiet *et al.* (2014) compared the use of cactus juice as a bio-flocculant with conventional polyacrylamide in industrial wastewater treatment. The scholars conducted experiments in which they substituted polyacrylamide with cactus juice, noting the need to reduce the use of chemical products in coagulation. From the data collected, the scholars found that substituting polyacrylamide with cactus juice in coagulation–flocculation process was highly effective. The bio-flocculant had removal efficiencies of 59.1%–69.1% in removing chemical oxygen demand and 83.3%–88.7% in removing suspended solids. Upon addition of lime to the process, the removal efficiencies with cactus juice for both suspended solids and chemical oxygen demand improved to over 90%. Based on these findings, they concluded that using cactus juice as flocculants meets sustainability requirements and is highly appropriate for regions in which cactuses grow naturally.

Pichleret *et al.* (2012) studied the natural coagulants also through a comparison model, using mucilage from *Opuntia ficusindica* obtained from Tucson, Arizona against aluminum sulfate ($\text{Al}_2(\text{SO}_4)_3$), the commonly used synthetic flocculant. After undertaking jar and cylinder experiments, the results demonstrated a high efficiency of the cactus mucilage in eliminating turbidity. At dosage concentrations of 3 mg/L, the extract heightened particulate settling by 330% in comparison to aluminum sulfate. Meanwhile, its effectiveness was similar to that of the synthetic flocculants at 0.3% dosage of the necessary aluminum sulfate concentration. These findings led the scholars to conclude that cactus bears the potential of a ‘green’ coagulant that has the advantages of being environmentally friendly and inexpensive.

Effectiveness and pH:-

Yang *et al.* (2007) investigated the effectiveness of cactus *Opuntia* as a natural macromolecular coagulant in removing turbidity. The study involved a jar test technique, with the coagulant’s effectiveness being reviewed on surface water (river and estuarine, 499 NTU and 547 NTU respectively) and landfill leachate. The scholars found that the coagulant reduced turbidity by as much as 98% in estuarine surface water and 70% in river water, but was less effective for leachate water (31.6 – 41.9%). In terms of impacts on water pH, the results indicated that increasing cactus dosage from 13 to 853 mg/L resulted in the marginal effect on the water’s final pH (ranging from 7.25 to 7.69 for estuarine water and 7.83 to 8.49 for river water). These observations implied that substantial increases in dosage did not affect the final pH of the water compared to the effect of chemical-based coagulants.

Noting that natural coagulants provide benefits in local availability, affordability, and lesser health hazards, Mukhtaet *et al.* (2015) evaluated the efficiency of turbidity removal of *Opuntia stricta* from Lahore, Punjab-Pakistan, as well as the effect of the water’s pH on such efficiency. They assessed the effectiveness of this cactus species through measuring turbidity removal at various pH levels and coagulant doses. The findings demonstrated that *Opuntia stricta*, even when used at low doses, achieved residual turbidity levels of below 20 NTU. Unlike other coagulants that are highly pH dependent, the turbidity removal efficiency of cactus remained consistent across a wide range of pH levels (5 to 10). In addition, the scholars found that the pH of the water remained constant during the coagulation process, which means that pH adjustment may be unnecessary in treatment processes. Such a merit is crucial because post-treatment pH adjustments are often necessary when using metal coagulants.

Lozano *et al.* (2015) explored the efficiency of mucilage extracted from *Opuntia ficus-indica* (nopal) as a natural coagulant complementing aluminum sulfate in clarification of water obtained from river Magdalena, Colombia. The scholars employed the jar test method, considering factors such as proportion and concentration of the coagulants, pH, and agitation speed in evaluating turbidity (NTU), color (UPC), and total dissolved solids. The study established that a maximum of 20 % nopal mucilage coagulant proportion alongside agitation speeds of 200 rpm reduced turbidity values to below 2 NTU, an efficiency corresponding to over 50% (96-95% highest). In addition, the combination reduced color to zero UPC and STD content to values under 200 mg/L without affecting the pH of the treated water significantly. These findings demonstrate that cactus mucilage can be used in combination with conventional coagulants to increase the efficiency of water treatment.

Noting that natural coagulants promise advantages such as abundance, inexpensiveness, multifunction, and biodegradation, Shilpa *et al.* (2012) evaluated *Opuntia ficusindica* and hyacinth bean peels from Mysore, southern India in water treatment. After treating surface water with the two natural coagulants, they studied parameters such as turbidity, pH, alkalinity, and bacterial contamination. The findings demonstrated that the turbidity removal effectiveness for the cactus was 89.03% at an optimum dosage of 20 mg/L while the percentage reduction in bacterial count was 20.15%. A pH of 9 was also discovered to be the optimum level for effective water treatment when using this cactus species. These findings underscore the promise of cactus as a natural coagulant and alternative to synthetic chemical coagulants such as aluminum and iron salts.

Nharingo and Moyo (2016) explored the use of cactus-derived biomaterials in decontamination of wastewater, observing that the past decade had witnessed much interest into the biological material in environmental remediation. The two scholars undertook an analysis of literature covering aspects such as characterization, physico-chemical compositions, application in bio-sorption and flocculation of pesticides, dyes, and metallic species. The studies reviewed provided findings based on different parts of the plant, including cladodes, fruit pulp, mucilage, and electrolytes. Their findings demonstrated that all these parts of the cactus had very high pollutant maximum sorption capacities, as well as removal ranging between 125.4 1000 mg/g and 0.31 2251.56 mg/g for bio-sorption of dyes and metallic species. Cactus also had removal percentage ranges of 98.7% for turbidity, 93.62% of chemical oxygen and 100% for heavy metals. In addition, cactus biomaterials proved to have wide pH ranges (3.27 for fresh cladodes, 6.03 for mucilage powder, and 5.3-7.1 for the fruit pulp) in which they work efficiently. Ultimately, the cactus biomaterials proved effective in removing pollutants, leading the two scholars to recommend scaling up from laboratory settings to community pilot plants and at industrial levels.

Mouniret *et al.* (2014) explored the flocculating activity of pectin and mucilage extracted from *Opuntia ficusindica* obtained from Pettit, Morocco. The tests were done on sanmix clay suspension, which served as synthetic turbid water. The findings demonstrated that the bio-flocculant had 98% flocculating activity in the sanmix clay suspension. In addition, the scholars found that the optimum dosage for mucilage was 2-8 mL while that of pectin was 2-6 mL by one-liter turbid water. In terms of pH, the study established that flocculation activity was poor in strong alkali conditions than in acidic conditions, as demonstrated by less than 60% flocculation in pH of 10 and above. Flocculation activity was however higher in acidic conditions, peaking at 98.8% for pectin and 97.2% for mucilage at pH 3.0. As a result, the scholars noted that pH played a significant role in influencing the effectiveness of cactus-derived bio-flocculants.

Miller *et al.* (2008) quantitatively evaluated the coagulant properties of *Opuntia spp.*, exploring its use as a coagulant for water treatment. The scholars undertook tests to evaluate the plant for turbidity removal in synthetic water samples (turbidity caused by kaolin clay particles), besides exploring some possible underlying coagulation mechanism for the plant. The findings indicated that the cactus species reduced turbidity in the water by 98% for a range of various turbidity levels, with such turbidity removal occurring at a pH of 10. The scholars observed that such turbidity removal levels were similar to those established for *Moringa oleifera*, but noted that the cactus' turbidity removal occurred through a bridging coagulation mechanism. The scholars concluded that *Opuntia spp.* could find valuable use as part of point-of-use water treatment technology, offering a practical and affordable strategy to producing potable water in developing communities.

Noting the promise of *Opuntia ficusindica* as a cheap, locally abundant, and eco-friendly bio-flocculant, Nharingo *et al.* (2015) explored the effectiveness of cactus powder in bio-coagulation-flocculation of heavy metal ions from wastewater drawn from Mukuvisi River, Harare, Zimbabwe. At natural ionic strength and dosage of 8 mg/L alongside a floc settling time of 180 min, the cactus powder achieved heavy metal removal of 84.16% (Cd), 85.74% (Zn), 93.02% (Cu) and 100% (Pb). The scholars also noted that the mechanism of the coagulation-flocculation process could have involved adsorption-bridging and adsorption-charge neutralization mechanisms. In terms of pH, the scholars found that the process of coagulation-flocculation was optimum at pH 5, with the percentage removal increasing gradually as pH increases up to pH 5 and then decreasing beyond a pH of 8. Based on these findings, the scholars concluded that the use of cactus powder in optimum conditions to remove heavy metal ions such as lead was highly promising and could be tested at commercial and industrial scales.

Another study by Bouatay and Mhenni (2014) involved effectiveness of cactus as an eco-friendly flocculant in the treatment of textile wastewater. Noting that *Opuntia ficusindica* mucilage bore promise owing to its abundance and inexpensiveness, the scholars reviewed its performance as a flocculant across parameters such as decolorization,

turbidity abatement and COD removal. The findings demonstrated that a combination of cactus mucilage with aluminum sulfate was highly effective, with the best conditions for the flocculation process occurring at pH 7.25, flocculant dosage of 40 mg/L, mixing speed of 30 rpm and a mixing time of 11 minutes. Based on these observed optimum conditions, the cactus mucilage yielded a decolorization of 99.84%, turbidity abatement of 91.66% and COD removal of 88.76%. Upon comparing flocculation performance of the cactus bio-flocculants agent and the commercial flocculants, the scholars found that the former exhibited the highest levels of pollution removal from wastewater.

Taa *et al.* (2016) explored the use of a cactus bio-flocculants extracted from *Opuntia ficusindica* in treating wastewater, basing their study on the need to replace chemical products and eliminate their negative effects on water disposal processes. The study entailed experiments using cactus juice on two types of wastewater, namely, synthetic chromium sulfate solution (100 ppm or 500 ppm) and real effluent obtained from a tannery (90 ppm or 900 ppm). From the findings, the scholars established that the cactus extracts facilitated rapid flocculation at a pH range of 7-9. In addition, the findings indicated that metal charge values were greatly reduced when cactus juice flocculation followed neutralization and lime coagulation. In this case, an initial charge of 176 mg/l reduced by 99.9% after 500 ml of 90 ppm effluent was treated with 4ml cactus juice. In the same fashion, cactus juice treatment led to significant drop in chemical oxygen demand (94%) and biological oxygen demand (95%). In terms of the tannery effluent, at a concentration of 900 ppm, the cactus juice achieved a 98.6% turbidity reduction. Ultimately, the flocculation results from the two solutions were satisfying when compared to results from DKFLOC, the chemical flocculants.

Overview of Literature Reviewed:-

The literature reviewed demonstrates that opportunities for use of bio-coagulants are high because these coagulants solve some of the drawbacks of synthetic chemical-based coagulants. Here, bio-coagulants such as cactus have shown promise in averting the health effects caused by treatment of water and wastewater with chemical products. Besides being highly effective, they are inexpensive, environmentally benign and abundantly available. Such merits make bio-coagulants especially appealing in the context of the developing world regions where wastewater treatment is a significant challenge. Such effectiveness is evidenced in aspects such as reduction of turbidity, coloration, chemical oxygen demand and heavy metals among other parameters. However, the studies reviewed reveal diverse findings regarding aspects such as effectiveness levels and optimum conditions. For example, the studies provide varied results in aspects such as optimum dosage and concentration, mixing times and speeds and optimum pH. Some studies demonstrate effectiveness at specific pH level while others demonstrate effectiveness over a wide range of pH levels. Most of the studies indicate that treatment with cactus-based bio-coagulants may not affect the final pH of the water. This diversity of insights from the literature and the lack of local studies in the context of Kenya underscore the need for localized research into the effectiveness of cactus-based bio-coagulants in treating wastewater in aspects such as turbidity, pH, and COD before making recommendations.

Methodology:-

This study employed an extensive literature review to collect data on the need, use, and effectiveness of cactus as a coagulant. The studies included in the review were restricted to those published after 2005 to ensure up-to-date findings. Publications from peer-reviewed journals only were also targeted to ensure academic rigor. Identification and selection of relevant articles for use in the study entailed a search on Google Scholar with the search terms informed by the main areas of focus of the present study. The slashes indicate the use of related phrases or keywords to expand the literature search.

- i. Use of natural/plant-based materials as coagulants in water and wastewater treatment
- ii. The effectiveness of cactus/*Opuntia ficusindica*/*Opuntia spp.* as a coagulant in water/wastewater treatment
- iii. Impacts on pH when using cactus/*Opuntia ficusindica* as a coagulant in water/wastewater treatment

Upon restricting the date, the initial search yielded 42 items published on the topic since 2005. Upon undertaking further screening to ensure the literature was restricted to those studies addressing strongly and specifically the topics of need, use, and effectiveness of cactus as a coagulant, the articles were reduced to 19. More than 19 articles are however cited in the present study owing to the use of other articles in the background section to help contextualize the research and provide a justification. Efforts were made to ensure rigor in these additional articles, restricting them to studies obtained from academic journals and important workshops or conferences on the wider and Kenyan context of wastewater treatment in particular.

Results and Discussion:-

After an analysis of the literature, a number of emerging themes regarding the three main areas of focus that informed the literature search were established. Table 1 provides a summary of the main findings.

Table 1:- Summary of Key Findings on Use of Cactus as a Coagulant.

Opportunities for use of natural/plant-based coagulants in water/wastewater treatment	Cited References
Lack of proper, effective, and sustainable water treatment systems in rural or underdeveloped areas	Yin (2010)
Demerits of chemical coagulants: - Ineffectiveness in low-temperature water, prohibitive procurement costs - Significant alteration of water pH, decreased transmission capacity, and corrosion problems - Environmental and sustainability issues: Negative effects on human health, large sludge volumes, costs, non-biodegradability	Yin (2010); Feria-Díaz <i>et al.</i> (2016); Vijayaraghavan <i>et al.</i> (2011)
Merits of plant-based coagulants: - Effectiveness aspects, no effect on pH - Environmental and sustainability aspects: Safe for human health, biodegradability, inexpensive, low-level sludge production	Yin (2010); Feria-Díaz <i>et al.</i> (2016); Vijayaraghavan <i>et al.</i> (2011)

Use of Plant-Based Coagulants:-

The literature reviewed reveals two main drivers behind the emergence of natural plant-based coagulants for water treatment, surrounding effectiveness, environmental, and sustainability considerations. The first driver entails the demerits associated with conventional chemical coagulants, which create an opportunity for consideration of their plant-based counterparts. Summing the demerits across the studies reviewed indicates that chemical coagulants are ineffective at low water temperatures, significantly alter water pH, decrease transmission capacity, and cause corrosion problems, besides causing environmental and sustainable development concerns such as costliness, detriments to human health, non-biodegradability, and production of large sludge volumes (Yin, 2010; Feria-Diaz *et al.*, 2016; Vijayaraghavan *et al.*, 2011). The number and significance of disadvantages associated with synthetic chemical coagulants, especially considering the need for environmentally conscious and sustainable water treatment approaches in today's world, therefore have been a driving factor behind the emerging consideration of plant-based coagulants for use in water treatment. One study by Yin (2010) contextualizes the problem to developing world

settings, where conventional water treatment may be insufficient or absent while at the same time proving too costly and environmentally undesirable.

The next significant driver for the use of plant-based coagulants is being necessitated by the merits presented by such coagulants, which are significant when juxtaposed against the drawbacks of chemical coagulants. The studies reviewed altogether indicate that plant-based coagulants are advantageous in aspects such as safety for human health, biodegradability, low cost acquisition, low-level sludge production, effectiveness in treating water, and no significant alteration pH of treated water (Yin, 2010; Ferial-Diaz *et al.*, 2016; Vijayaraghavan *et al.*, 2011). Notably, most of the aforementioned merits indicate that plant-based coagulants such as cactus align with local, national, and global objectives in environmental protection and sustainable development. Such observations indicate that plant-based coagulants provide promising alternatives to synthetic chemicals commonly used in coagulation. In addition, the local availability noted in literature such as Yin (2010) also suggests that plant-based coagulants contribute to sustainable development of potable and wastewater treatment in underdeveloped regions of the world where there are challenges currently on treatment capacity. Such findings demonstrate the opportunities for rural and urban places in Kenya to explore the use of locally available plant-based coagulants.

Effectiveness of Cactus as a Coagulant:-

Besides its merits in promoting environmental and sustainable development concerns, the prospects of cactus in wastewater treatment in Kenya also centrally depends on its effectiveness as a coagulant. Narrowing down to the use of cactus in coagulation, evidence for removal of various contaminants and undesirable elements in wastewater varies. From the literature reviewed, there is overwhelming evidence regarding the effectiveness of the plant parts and extracts in the removal of turbidity, as demonstrated in the summary table (Table 2) indicating that twelve of the nineteen studied articles established such effectiveness. There is also some evidence for the effectiveness of cactus in removing chemical oxygen demand and coloration in wastewater from four studies for each of these parameters, which suggests that cactus may be useful in this respect. Meanwhile, removal of heavy metals (two studies), suspended solids (two studies), and dissolved solids (one study) indicates the need for more inquiry to establish sufficient evidence for the effectiveness of cactus in such respects. From these observations, the inference is that cactus has proven value in removing turbidity and significant evidence for removal of color and chemical oxygen demand, while removal of heavy metals, suspended solids, and dissolved solids still call for further research. Notably, the effectiveness of cactus in the aforementioned areas was influenced by the use of varying conditions in aspects such as pH, optimum dosage, agitation speeds, and temperature. As a result, application of cactus in wastewater treatment in the Kenya context also necessitates studies to establish the optimal conditions within which the plant can be effective.

Table 2:- Evidence for the Effectiveness of Cactus in Wastewater Treatment.

Contaminant Removed	Number of Supporting Studies
Turbidity	12
Suspended solids	2
Dissolved solids	1
Chemical oxygen demand	4
Biological oxygen demand	1
Color	4

Implications for pH:-

One determinant of the effectiveness of cactus as a coagulant is pH implications, where the pH of the treated water determines the value of cactus for coagulation. Besides, pH of water or wastewater being treated also constitutes a crucial consideration for optimal coagulation. In terms of effects on the final pH, three studies reviewed reveal that cactus has little to no effect, which makes the treated water safe for use (Yang *et al.* 2007; Mukhtar *et al.*, 2015; Lozano *et al.*, 2015). These findings underscore the promise of cactus as a coagulant, especially considering that significant alteration of the pH of treated water is one of the demerits noted among synthetic chemicals commonly employed as coagulants.

The studies regarding the pH at which cactus is effective in the coagulation process provide diverging observations. On one hand, three studies reveal that the effectiveness of cactus in treating wastewater occurs across a wide range of pH values (Mukhtar *et al.*, 2015; Nharingo&Moyo, 2016; Taa *et al.*, 2016). Meanwhile, five other studies indicate that the effectiveness of cactus in the coagulation process is determined by pH, where the plant is effective within a

narrow pH range (Shilpa *et al.*, 2012; Mouniret *al*, 2014; Miller *et al.*, 2008; Nharingoet *al.*, 2015; Bouatay & Mhenni, 2014). In addition, the values of pH given as optimal for effective coagulation vary among the studies. Shilpa *et al.* (2012) find cactus effective at an optimal pH of 9 for turbidity removal, Mouniret *al.* (2014) at pH 3.0 for turbidity removal, Miller *et al.* (2008) at pH 10, Nharingoet *al.* (2015) at pH 5 for heavy metal removal, and Bouatay and Mhenni (2014) at pH 7.25 for removal of turbidity, color, and chemical oxygen demand. Such observations indicate that optimal pH may vary according to the contaminant being removed. At the same time, optimal pH may be varying because of the source and properties of the water, as well as the cactus species used in coagulation. Based on these observations, use of cactus in the Kenyan context may first require studies to establish effectiveness under various acidic or alkaline conditions using the Cactus specie that is native to the country.

Conclusion:-

The study sought to explore the promise of cactus as a natural plant-based coagulant for the environmentally friendly and sustainable treatment of water and wastewater, which would benefit developing world contexts such as Kenya. Following a review of the literature, the study establishes that plant-based coagulants offset the demerits associated with conventional chemical coagulants, while also being locally available. In this case, the pursuit of plant-based coagulants such as cactus is happening because such coagulants have the potential of not only being effective, but also allowing wastewater treatment that is sustainably manageable and environmentally appropriate. Such merits over traditional synthetic coagulants would be highly appropriate for the Kenyan context, helping to not only address water stress problems, but also deliver an approach aligned with Kenya's pursuit of sustainable development goals as set in the UN's 2030 Agenda. Cactus has been found to be effective in removal of turbidity, chemical oxygen demand, and coloration, with other possible uses being in the removal of heavy metals, suspended solids, and dissolved solids. The studies reviewed also showed that cactus has no significant effect on the pH of the treated water, unlike most synthetic chemical coagulants. However, there is no consensus regarding whether cactus is effective over a wide range of pH values or across a narrow range of pH, as well as specific optimal pH for highest efficacy. Considering such effectiveness alongside the advantages in biodegradability, local availability, and lower costs, cactus potentially represents an environmentally friendly and sustainable solution for wastewater treatment in the Kenyan context. Further scholarship into cactus as a coagulant in the Kenyan context is necessary before a recommendation is made, where experimental models will help establish its effectiveness, optimal conditions, and cost-effectiveness for its successful use.

Breast Cancer, Risk Assessment, Gail model, Prediction.

Abstract

The rationale of this study: breast cancer is an increasing global public health problem due to its high incidence and mortality. Lots of debates over the actual value of screening program at population level continue justifying, enthusiasm for risk-stratified screening is gaining momentum and can be useful for guiding public health strategies of breast cancer prevention. The Gail model is considered the best available means to quantify an individual woman's risk of developing BC and is crucial to provide risk-benefit analysis before deciding interventions designed to lower breast cancer risk.

Objectives: to identify the mean five years and lifetime risk development of breast cancer among Egyptian women.

Methods: cross sectional study conducted on a sample of 156 women attending family planning clinics using systematic random sampling technique. The instrument used is based on the information required for analysis by the Gail model.

Results: after analyzing the collected data according to the Gail Model, about 30% of the sampled females had high risk for developing BC >1.66% with their mean five-year breast cancer risk was 1.53 ± 1.49 , and their mean lifetime breast cancer risk up to age 90 years was 20.54 ± 11.86 .

Conclusions: our findings surges the need for BC screening services for early detection directed mainly for women with multiple risk factors making informed decisions about the screening methods best suited to their individual situations.

Introduction:-

Although advances in early detection, diagnosis, and treatment, led to significant declines in breast cancer (BC) deaths yet it remains the most prevalent and the second leading cause of cancer deaths in females worldwide based on the findings from the WHO Global Health Estimates 2013⁽¹⁾. BC among Egyptian women, accounts for 18.9% of total cancer cases, according to findings from the Egyptian National Cancer Institute's (NCI),⁽²⁾ Incidence rates are steadily rising in the world. Between 2002 and 2020, breast cancer incidence and mortality are expected to rise 50%, with the greatest rise occurring in developing countries 19,20. With the steadily rising incidence rates, it is imperative to continue research, increase resource opportunities and raise global awareness of BC⁽³⁾.

Corresponding Author:-Dr. Eman M. Mortada.

Address:-PhD in public health and preventive medicine, Assistant Professor in health sciences department, Health and rehabilitation sciences college, Princess Nourha Bint Abdelrahman University.

Egyptian BC patients showed a shift towards a younger age distribution affecting mainly 30–60 years of age. The mortality rate of BC is decreasing in developed countries, compared to the increasing mortality in the developing countries as people are diagnosed with BC in late advanced stages⁽⁴⁾. According to WHO, early detection is the cornerstone for BC control and it can improve its survival and is extremely important to reduce the burden on the health care system. There is growing interest in trying to estimate individual BC risk women and follow-up screening for “high-risk” individuals. This not only to improve early detection, but also to avoid many unnecessary inspections and reduce the burden on the economy if the women subgroup with higher risk can be adequately identified (5). Consequently, the accuracy of a woman's perception of her risk of developing BC has gained importance as a priority for primary prevention. “High-risk” individuals in BC can be identified by the risk assessment tool for women aged 35 and older⁽⁶⁾.

BC is one of the diseases predominantly influenced by risk factors, according to American cancer society, the reported risk factors of BC are being a female, ageism, race, ethnicity, younger age at menarche (before 12 years old), older age at menopause (55 years old), mutations in BC genes namely BRCA1 or BRCA2, history of BC in first degree relatives, having history of previous BC, some benign breast diseases, hyperplasia or lobular carcinoma in situ, exposure to huge dose of radiation at a young age, HRT, smoking, postmenopausal women, overweight or obesity, didn't breast feed their babies, and being physically inactivity⁽⁷⁾.

Several models were developed to assess the additive effect of multiple risk factors to estimate the overall risk. Gail model (GM) is commonly used BC risk assessment model and is used to assess the individual risk of BC. And estimating the probability of a currently healthy women having given risk factors will develop BC within 5 years and lifetime by developing a mathematical model that provides individualized risk estimates of developing BC with varying risk factors, including age, age at menarche, number of prior breast biopsies, age at first live birth, and number of first degree relatives affected with BC. Relative risk was calculated for each of these risk factors; then were used to calculate the absolute five years risk from the time of assessment and a lifetime risk up to 90 years old⁽⁸⁾.

The results of risk assessment can be used to develop an individualized plan to assist patients in decision-making regarding the implementation of frequent surveillance, chemoprevention, or prophylactic surgery⁽⁹⁾. In women aged ≥ 35 years with a 5-year risk of $\geq 1.67\%$, it is recommended to perform CBE biannually and mammography annually. It is crucial that among a population with increasing incidence and mortality, to monitor the risk of developing BC and take precautionary public health interventions. The purpose of this study is to utilize quantitative assessment to. Despite the fact that, there are a lot of up-to-date investigation equipment and screening projects directed for females, most of them are very expensive. Therefore, if the subgroup of specific high-risk females can be identified, unnecessary inspections avoided and burden on the economy reduced. It can also achieve the purpose of early detection and early treatment of BC. Those who are at high risk for BC (Gail score $\geq 1.67\%$) will benefit more from invasive approaches, while women who are categorized as low risk are followed-up through the routine screening program to avoid complications and high costs⁽¹⁰⁻¹¹⁾. When women are more knowledgeable about their personal risk, they can make informed decisions about prevention methods and screening options to detect cancer early. Women at higher risk should be educated on their need for higher screening methods such as magnetic resonance imaging, and initiating screening at an earlier age and at more frequently should be taken into consideration. Ultimately, planning and implementing early detection and screening programs of BC can be more successful⁽¹²⁾.

Hypothesis:- using the Gail model helps predict BC risk.

Objectives:-

- 1- To estimate the risk of developing breast cancer over next five years
- 2- To estimate the risk of developing breast cancer over lifetime periods

Methodology:-

Study design and setting: to fulfill the objectives of the study a cross sectional study conducted over 4-month period (from May to end of September 2016) on women attending the family planning outpatient clinic at Zagazig University Hospital.

Sampling technique and sample size:-

The participants considered eligible for the study if they met the following inclusion criteria: being able to read and write women, without a history of BC and being 35 years or older (as in the GM) as GM provides the five-year and

lifetime (up to age 90) BC potential risk for women ≥ 35 years. The exclusion criteria included women younger than 35 years, refused to participate, and those suffering of acute medical conditions. A sample size of 156 women was calculated using open epi program ⁽¹³⁾, based on the following parameters: 80% power of the test, 95% confidence interval, and 19%¹³, 450 monthly flow to the clinic, and prevalence from published literature ⁽²⁾. For data collection (three days per week) using a systematic random technique, where every third (450/156), attending the clinics included if she met the inclusion criteria. If did not meet the eligibility criteria, then the next (4th) was selected and so on till the required sample size was achieved.

The tool for data Collection:-

The assessment made using a self-administered questionnaire, the instrument used for data collection is the BC risk assessment tool using the model developed by Gail ⁽⁸⁾. The questionnaire formed of 2 parts, the first part about the socio-demographic characteristics: educational level, occupation status, place of residence and, marital status.

The second part included information about women's characteristic and risk factors related to breast cancer: age, age at first menstrual cycle whether (responses were: at least 14 years, 12 to 13 years, or fewer than 12 years), age at first childbirth (responses were: nulliparous, fewer than 20 years, 20 to 24 years, 25 to 29 years, or at least 30 years), and having a family history of BC (i.e., mother, sister) and their number. History of previous breast biopsy, those women had had any previous biopsy were asked about the number of biopsies (1, or 2), presence of atypical hyperplasia in a biopsy specimen (yes or no).

Questionnaire translation and Pilot testing:-

Using forwards- backwards translation process by two bilingual expert translators, then comparing the agreement (between the original English version and the back translation version) was done. The translated Arabic version of the questionnaire pilot tested on a sample of females before the actual commencement of the study to assess its face validity, its clarity and the time required for filling it up.

Statistical Methods:-

The collected data were analyzed by SPSS 24 ⁽¹⁴⁾ using descriptive statistics including the mean, standard deviation, frequency, and percentage. To estimate each woman's 5-year and lifetime risk for developing BC, calculated using the software program available from the NCI online ⁽⁸⁾. We used 1.66% in Gail score as a cut-off value to define low and high risk groups for developing BC according to the estimated BC five years risk assessment as women with the BC risk of $\geq 1.67\%$ were considered as high-risk ⁽¹⁵⁾.

Ethical considerations:-

Before collecting data, the entire required official permissions were obtained before carrying out the study. Participants were informed that their participation is voluntary and were informed about the objectives of the study and importance of the research and those who agree to participate signed an informed consent. The confidentiality of the collected information is assured through anonymity of the participant, the questionnaires were numerically coded and the study results would be used only for the purpose of research.

Results:-

Table 1: - Personal characteristics of the sampled females (n=156).

Variables	Categories	No.	Percent
Marital status			
	Not married	31	19.9
	Married	125	80.1
Educational level			
	Primary	12	7.7
	Secondary	56	35.9
	University	88	56.4
Employment state			
	Not Working	40	25.6
	Working	116	74.4
Family income			
	High	19	12.2
	Middle	107	68.6
	Low	30	19.2
Total		156	100.0

Our finding revealed the personal characteristics of the sample in table (1) as the majority of them were married, working, having middle income and are university graduates (80.1, 74.4, 68.6 and 56.4%) respectively.

Table 2:- Distribution of Risk Factors among Participants according to the Gail model.

Variables	Category	No	Percent
Age groups (y):			
	36- 45	92	59.0
	46-55	29	18.6
	≥55	35	22.4
Age at 1st menstrual period (y):			
	Unknown	13	8.4
	≥14	19	12.2
	12-13	84	53.8
	7- 11	40	25.6
Age at 1st child birth (y):			
	No children	8	5.1
	≤ 20	16	10.2
	20-24	93	59.7
	25-29	29	18.6
	≥30	11	6.4
Number of 1st degree relatives with breast cancer			
	Unknown	6	3.8
	Zero relative	33	21.2
	1 relative	72	46.2
	More than 1 relative	45	28.8
Biopsy			
	Unknown	0	0.0
	Yes	19	12.2
	No	137	87.8
TOTAL		156	100.0

On assessing women's risk factors among the study subjects the results showed that the majority of them (59.0%) aged from 36-45. 53.8% experienced their first menses at age 12 to 13; 59.7% of the sample women had first live birth in age group (20 - 24) years old, 46.2% of them had first degree relatives suffered from BC. Only 12.2 % of them performed breast biopsies. Table 2

Table 3:- Breast Cancer five-year Risk and life time Risk Based on the Gail Model.

Risk	X±SD	Minimum risk	Maximum risk
Mean five-year risk	1.53 ±1.49	0.3	10.80
Mean five-year risk for women of the same age without risk factors	0.91±0.44	0.3	1.80
Mean risk of participants up to age 90 years	20.54±11.86	6.8	91.6
Mean risk up to age 90 years for women of the same age without risk factors	12.65±9.14	9.10	95.0

Table 3 assessed the mean five-year BCR was 1.53 ±1.49 according to the GM, and The mean lifetime BCR up to age 90 years was 20.54±11.86. In comparison with women of the same age and average risk factors, 46 (29.6%) had a higher five years risk and 29 (18.7%) had higher lifetime risk (figure 1 and Table 3).

Figure 1:- comparing high and low 5 years and lifetime risk among the sampled female.

Discussion:-

Breast Cancer Risk Assessment (BCRA) is crucial when making decisions about screening for individual women with recommended intervals for screening mammography. Breast cancer risk was calculated using the National Cancer Institute's on-line BCRA Tool or the Gail Risk Assessment Tool developed by Gail, based on data from the BC Detection and Demonstration Project, a mammography screening project conducted on 280,000 women between 1973 and 1980. By applying the GM for the current study, the findings showed that about (30%) of the sample had a higher five years risk and about (19%) had a high lifetime risk. On the other hand, our findings are higher than other previously published researches⁽¹⁶⁻¹⁸⁾.

BC risk factors using the GM are as follows: current age, age of menarche, previous breast biopsies, including the number and presence of atypical hyperplasia, age of first live birth, family history of BC in first-degrees, and ethnicity⁽¹⁹⁾. The findings of the current study support the growing body of evidence from female breast cancer incidence suggesting that age is a well-known risk factor for BC susceptibility²⁴, as the findings revealed that the majority the sampled women (59%) were in age group 35-45 years old. The finding contradict with another 2 studies indicated the highest occurrence of female BC is shown in the age category of 45-50 years⁽²⁰⁾. A much higher risk for BC was found in women who had experienced early menarche, a previous breast biopsy, and a first live birth after 30 years of age⁽²¹⁾.

Regarding the age of the sample at first childbirth we found that the majority of them (59.7%) have their birth were in the age group from 20-24 years, this supported the long-standing hypothesis that the earliest age at first pregnancy and longer duration breastfeeding has a protective effect lower incidence of BC⁽²²⁾. Nulliparity and first live birth at older than 30 years of age are associated with an increased risk of subsequent breast cancer. Women who have never given birth or who have given birth to their first child after age 30 are at high risk for BC⁽²³⁾. Pregnancy at a young age is associated with a markedly reduced risk for BC⁽²⁴⁾.

In a previous study, after controlling for age, the greatest increase in risk has been associated with a family history of BC but the number, type, and age at onset in their relatives are important in estimating the magnitude of risk⁽²⁵⁾. Together with having family history in first-degree relative increasing the susceptibility to develop BC, where one first-degree relative could double the risk and having two first degree relatives increases the risk approximately 3-times. The findings in present study illustrated that 46.2% have one first degree relative this is even higher than findings of a study conducted in Alexandria, where the 20% of them had first degree cousins and nearly two thirds of the cancers which will appear in the next 25 years will occur due to unawareness of the public⁽²⁶⁾. Which surges the need for BC screening for early detection prior to the onset of symptoms through various methods as frequent monthly breast self examination, periodic clinical examination and mammogram and management of breast cancer to decrease the burden of morbidity and mortality associated with the disease⁽²⁷⁾.

Conclusion and Recommendations:-

The current study showed that about thirty percent of the sample had a higher five years risk and nineteen percent had higher lifetime risk.

1. Our findings surges the need for BC screening services for early detection directed mainly for women with multiple risk factors with health education on proper performance of monthly BSE, stress on the importance periodic clinical examination and mammography and making individualized informed decisions about the screening methods best suit them through individual counseling approach.
2. For clinicians , health providers and practitioners, incorporating risk assessment as part of routine clinical visits using the GM can supply women with accurate information about BC risk factors, consequently the appropriate prevention strategies and screening modalities can be tailored to each individual woman's risk profile to lower their risks.
3. For policy makers, they need to put an organized screening program on their agenda and develop national breast cancer screening guidelines.
4. Systematic screening and Early detection of breast cancer is improved by a follow-up screening for "high-risk" individuals. Therefore, it is important to define what is meant by "high-risk" individuals.
5. Women at higher risk should be educated on the their need for additional screening methods also consider initiating screening at an earlier age and at more frequently. When women are more knowledgeable about their personal risk, they can make informed decisions about prevention methods and screening options to detect cancer early.

Conflict of interest:- the author declared no conflict of interest.

Abstract

Research attempts to review the understandings and concepts of life environment learned in Moslem Boarding House (Pesantren), to examine how is the learning of religion values related with life environment, and to acknowledge how this learning is implemented. This research was located at Pesantren Al Kahfi Sidoarjo, and exploration was done through several ways. First, primary data are collected from respondents of santri (students in Pesantren), either boys and girls. Second, in-depth interview is conducted with the managing boards of Pesantren. The findings of research were described as following: (1) The learning is given to produce a change in students on the directions made by Pesantren. This change concerns with environmental issue, meaning that the understanding of students about environmental issue would change. Most students (90.2%) have understood life environment concept and agreed if the review of life environment must be delivered every day or every week. Others (98.7%) have agreed with proverb that cleanliness is a part of the faith. (2) Few students reject such life environment concepts and its reviews. The reason behind this reject is that there is still a strong patriarchy culture which frames the way the students think. The condition where students live still influences their behavior. (3) The learning is emphasized on the importance of environmental cleanliness. It is done by reciting books about this issue, by organizing the outing class or the contests of making poster with contents of environmental cleanliness and learning comfort, and by conducting homage service around Pesantren. (4) Some students (78.1%) agree that homage service could be held once a week, and some others (75.6%) declare that punishment should be given for the negligent. (5) Any violation to the agreement (homage service) will be subjected to fine or other kind of punishment.

Introduction:-

Pesantren is an organization of preaching or education. It has some functions. First, Pesantren prepares Moslem youths with education in order to produce Islamic generation with good moral quality (khaira ummah), with an understanding on mission of amar ma'ruf nahi munkar and also with a sense of kindness. Second, Pesantren is also a

Corresponding Author:- Udji Asiyah.

Address:-Department of Sociology, Faculty of Social and Political Sciences, University of Airlangga.

place to educate the cadres of Moslem scholars, the agent of excellence, and the developer of science, especially theology. It can be said that the tasks of Pesantren are to prepare and educate thâ'ifah mutafaqqihah fid-dîn, respectively the cadres of Moslem scholars and the caretaker of Pesantren who always respect personality of Prophet Mohammed and have a willingness to implement the duty of indzârul qawm (Abdurrahman, 2008).

A certain effort may determine the force that moves a certain thing. But, this effort does not influence the length of time when the force subjects to a thing to move. Sometimes, the effort is fast, or even slow at other times. For instance, Siti push the cupboard to move it to the other corner at distance of 3 m. Siti needs 5 minutes to move the cupboard there. Budi can move the same cupboard only by 3 minutes. Siti and Budi do same effort, but time needed for each effort is different. The effort per unit of time is called energy. It is then said that Budi has bigger energy than Siti. Energy is defined as the rate of effort in unit of time. Energy represens a capacity to use the effort. Energy is indestructible but it only changes its shape.

Method of Research:-

Research uses a mixed method comprising of quantitative and qualitative measures. Both are used simultaneously in a way suggested by Creswell (2012), and it is called as concurrent mixed methods.

Quantitative method is represented by survey, whereas qualitative method involves case study. Survey is used to collect quantitative data, especially those concerning with undertandings of life environment in Pesantren and the effect the life environment may have on the learning in Pesantren. Case study is useful to collect data on the description of "unique cases" related with learning process.

The object of research is Pondok Pesantren Dakwah Al Kahfi, Tarik-Sidoarjo. This Pesantren also opens formal school, called Integated Islam Junior High School. It tries to prepare Moslem youths with Islamic personalities, knowledge of Islam religion, Arab language, knowledge of preaching, and general knowledge.

To enrich information about these unique cases in learning process, then in-depth interview is conducted with some selected informants, which in this case, involving teachers and religious elders or Kyai. Questionnaire is given randomly to Pesantren students.

All data are subjected to analysis. First, the analysis of quantitative data involves arranging the data into frequency table to describe the reality observed. Second, qualitative data are analyzed by displaying data into narrative textual explanations to describe the reality observed.

Result and Discussion:-

The Learning Process in Pesantren Al Kahfi:-

Religion values represent the guidance to produce good, fair and proper behavioral standard. These values are derived from religious norms. These norms usually bind the believers into several rules or prohibitions. Believers must obey the rules to obtain happiness in the world and the hereafter. Violating these rules will lead to the act of sin.

Educational environment in Pesantren is very suitable to be a secondary learning medium to create good personality. Formal education does not match with this personality goal. It is also incompatible for personality building because teaching at formal school is not wisely given and teaching style is too much monotonous. Learning structure and infrastructure are not feasible to develop good personality in students.

The list of incompatibility factors still grows. Students may be assigned into less proper learning groups. Improper learning habit, poor learning achievement, bad learning behavior among friends, and too strict school regulation, are only factors causing difficulty, anxiety, disappointment and dissatisfaction among students. Healthy and convenient school environment is therefore needed. Education at school is a secondary learning place, and it is where formal learning is done. At school, children not only learn how to read, write and count, but also understand the importance of self-dependence, achievement, universalism, and specificity.

Learning Process of Religion Values. Learning the religion values related with life environment in Pesantren Al Kahfi is an action directly done by students with their consciences. Students are aware with the importance of

working together with friends and of making interaction with other individuals in Pesantren. Rules in Pesantren must be understood to keep students to realize that certain norms and values have prevailed in Pesantren.

After accepting these rules, students are considered as able to take a certain position into the community. In other words, students indeed have a capacity of tolerance and interaction not only with others at same age, but also with the community.

Curriculum To Support Religion Values. Learning environment in Pesantren Al Kahfi is a classroom type but religion values and character education are set into learning materials. Religion material (diniyah) is also given and it is supported by reviewing some religion books, such as (1) Book of Bulughul Maram (containing rules of devotion and rules of behavior); (2) Book of Taklim Muta'alim (explaining politeness and morality); (3) Book of Fiqh Sayid Tsabit (concerning with rules of devotion, issues of holiness and cleanliness, others); (4) Book of Siroh Nabawiyah (history of Prophet Mohammed and his struggle on Islam mission); and (5) Conflict Management.

Change Process in Pesantren. Social change has many definitions. According to Ranjabar (2001;17), social change is a process where structural change of the community goes along with the change of the culture and function of a social system. In the words of Gillin and Gillin (in Poloma, 1979), social change is a variation of life styles that are accepted as good because it is compatible with the change of geographical condition, material culture, geographical composition, or ideology. The change may be desired because it is diffused fast or there is new inventions in the community. In short, Samuel Koenig (1957; 279) said that social change refers to modifications occurring in the living pattern of the human. These modifications occur with internal and external causes.

Students as one stakeholder in Pesantren are subjected to the rules prevailed in Pesantren. These rules will organize their activity in 24 hours a day from wake-up in the morning to the sleep at night. Learning-teaching activity is also conducted on these rules.

Pesantren is unique if compared to other educational institutions. Students or santri in Pesantren are living together with their teacher or kyai in one certain complex of self-dependence settlement. The following is general characteristics of Pesantren.

- a. There is intimate relationship between santri and kyai.
- b. Santri is always obedient and submissive to kyai.
- c. Santri lives at simple and self-dependent ways.
- d. There is mutual-share with sense of kinship.
- e. Santri is trained with discipline and asceticism.

In the history of Indonesia, Pesantren plays significant role in enforcing faith, improving piety, fostering morality, developing self-dependence, and enlightening the nation through informal, non-formal and also formal educations provided by Pesantren. Being informal institution, Pesantren acts as a big family that helps enshaping the personality of santri. Pesantren also teaches skills that may help santri to develop their self-dependent capacity.

Energy and Effort. Energy plays very important role for the living of human and also for the progress of a nation. All human activities are done with energy. From pre-history to history periods, woods are the only source of energy for cooking and heating. In early part of thirteenth century, the coal was introduced. Steam engine was invented and using coal as its energy source until at eighteenth century, when new development came to the human life. Steam engine could produce quite enormous energies to mobilize industrial machines. It shot the fire of industrial revolution in European countries where energy was used in huge quantity.

In the early of nineteenth century, the emergence of fossil-oil as energy source has replaced coal as the source of heating and lighting. This oil is then displaced by electric in the end of nineteenth century. Electricity is produced from the rotating components in generator. However, energy source used to activate generator is coming from fossil-oil, coal, and natural gas. Electrical energy plays important role in human living. In twentieth century, some alternatives of energy are ready to be used by human, including native heat, nuclear, and solar energies.

Energy Conservation Law concerns with the change of energy. Some energies are considered, such as radiation energy, potential energy, and chemical energy. Radiation means as disseminating toward the affordable spots. Radiation energy can be found in the beams of the sun that subject directly to the earth, or the sense of warm from

the bonfire. Potential energy is an energy that moves to produce other energy. The silent propeller does not produce energy, but when the propeller moves with the wind, it creates electricity. Therefore, the propeller has changed its potential energy into kinetic energy, and finally, producing electric energy.

It is said that energy is a capacity needed for doing an effort. Someone may need energy to walk, run, work, and do other activities. Foods and beverages provide chemical energy to be burnt in human body, and this energy is used for many efforts or activities. Someone is said as doing an effort when pushing a certain thing. The rate of effort depends on the force used to push the thing and the distance of displacement of this thing.

The definition of effort in physic involves two requirements. First, the force subjected to a thing must move the thing to displace at certain distance. Second, to ensure that a force does an effort on the thing, then the force must have a direction in parallel with the direction of displacement. Effort in daily life is activity done by human. For instance, kyai tries to improve the progress of Pesantren with various strengths and strategies. Teachers apply learning method on students' needs. Santri learns physic for preparing daily exam and others.

The Relationship Between Learning Process and Energy Conservation Law:-

Pesantren Al Kahfi is full-day school at the level of Junior High School. Learning schedule ends in ashar (15.00 pm). Teachers control the process in shifts. In Teacher Office, male and female teachers are separated for convenience. This separation is aimed to reduce unnecessary talk and interaction, and the interaction ends in ashar. The exception of separation is only made during the meeting.

Learning activity begins from 03.15 am in early morning. Santri is waken up and prepared for sholat yaumul lail (night prayer), and after that, it continues with waiting the time for sholat Subuh. After sholat shubuh, santri recites the Pray of Al-Ma'tsurat and follows it with dzikir. Recitation of Al Qur'an is done until 6.30 am. When this ends, santri takes shower and does a breakfast. At 7.20 am sharp, school begins with diniyah (religion) and other materials relevant in Junior High School.

Pesantren integrates three materials into one learning package. These materials are: school internal (curriculum from National Education), diniyah (religion, related with interpretation and riyadus sholihin) and Al-Quran recitation expertise. It becomes the distinctive marker of Pesantren Al Kahfi that distinguishes it from other Integrated Islamic School. Students at other schools may memorize 2 juz or 3 juz of Al-Quran. In Pesantren Al Kahfi, students at Second Grade have memorized 30 juz of Al-Quran, and one of them is Rani.

The integration of learning materials is communicated early to parent or student guardian. At Pesantren Al Kahfi, 100% items in the National Education Curriculum are implemented, but it is added with Religion and AL-Quran Recitation. It may answer the question of parent about what kind of school is provided by Pesantren. During the preparation of national exam, the materials of exam are drilled to expect students for obtaining high academic achievement.

The internalization of religion values related with life environment is conducted during learning process at school or Pesantren. These religion values are delivered by reciting religion books, by organizing the outing class or the contests of making poster with contents of environmental cleanliness and learning comfort, and by conducting homage service around Pesantren. Some students suggest punishment for the negligent, such as buying cleaning tools or cleaning two rest rooms in two days in a row. Santri also expects that teachers must intensify the message that damanging the environment is a sin.

If related to energy conservation law, learning at Pesantren Al Kahfi has brought a change consistent with the plan of Pesantren. The fact that learning process has given good change is described as following:

Learning process needs energy, and this energy is contained within foods and beverages that must be prepared by Pesantren. The rate of effort depends on the rate of force given to the effort and also on the rate of displacement (result of learning). All these rates are needed to ensure the success of learning.

Conclusion:-

Pursuant to data and discussion on the learning of religion values related with life environment in Pesantren, some conclusions are made.

1. Learning process about life environment in Pesantren is performed by internalizing religion values. It aligns with energy conservation law that expects a change from learning result.
2. The learning has brought a change in the direction planned by Pesantren. This direction concerns with environmental issue or with the understanding of students about the issue. Most students (90.2%) have understood that life environment must be maintained by keeping environment cleaned, discarding garbages into can, refraining from spitting at public space, and helping the people with difficulty. Few students reject this understanding, and the rejecter is dominated by male. However, there is agreement that the review of life environment must be given every day or every week. Only few students reveal a refute to daily or weekly review of life environment. Male students are dominant.
3. Most students (98.7%) have agreed with the relationship between cleanliness and faith. Learning process at school/Pesantren is related with the importance of environmental cleanliness. It is done by reciting books about environmental cleanliness, by organizing the outing class or the contests of making poster with contents of environmental cleanliness and learning comfort, and also by conducting homage service around Pesantren. Some students agree these measures despite few male students reject it.
4. Some students (78.1%) agree with once a week homage service. Other students (75.6%) agree to give punishment for the negligent. The suggested punishment is buying cleaning tools or cleaning two rest rooms in two days in a row.
5. Few male students reject life environment concepts and its reviews. This rejection derive from a strong patriarchy culture which frames the way the students think. The condition where students live still influences their behavior.

Abstract

This paper investigates the impact of incomplete mixing at cross junctions on the variation of physicochemical water quality parameters in a lab scale water distribution network. The experimental setup was constructed in the Hydraulic Laboratory of the Engineering Institute at the National Autonomous University of Mexico where a series of experiments with varying inflows, chlorine and natural organic matter concentrations were carried out. Water samples were collected at various sampling points for water quality analysis. The results show how water quality parameters can vary in water distribution network due to the impact of incomplete mixing at cross junctions.

Introduction:-

The mission of a water distribution network is to provide safe drinking water to the costumers. The Safe Drinking Water Act (SDWA) is the federal law that protects public drinking water. Under the SDWA, the Environmental Protection Agency (EPA) sets standards for drinking water quality and implements various technical and financial programs to ensure drinking water safety. Although most treatment plants are able to achieve these standards, the water distribution systems can be a point where issues regarding pathogens can occur. Variations in hydraulic conditions at junctions can vary the mixing conditions and modify physicochemical parameters of water. Therefore, the objective of this research was to investigate the impact of mixing phenomenon at cross junctions on the diffusion of water quality parameters in the distribution network using a lab scale water distribution network.

Materials and Methods:-

Experimental setup and preparation:-

In order to study the impact of incomplete mixing at cross junctions on the diffusion of physicochemical water quality parameters in the network, a series of experiments were carried out in a laboratory network system. The experimental setup was divided into three sectors:

1. Sector A consisted of a cross junction pipe system with two inlets (North and West) and two outlets (South and East), Fig 1.
2. Sector B, supplied from East outlet of sector A and;
3. Sector C, supplied from South outlet of sector A.

The experimental setup was constructed with polyvinyl chloride (PVC). The network used pipes of diameter 32 and 38 mm (Pipe diameters of each segment are shown in the schematic diagrams).

Corresponding Author:-Rojacques Mompremier.

Address:-Instituto de Ingeniería, Universidad Nacional Autónoma de México.

The system also included.

- a water reservoir (2.12 m³ of capacity);
- two storage tanks (450 L of capacity each) at elevated position for gravity flow;
- four flow meters (CZ300s model Contazara S.A, Spain) located at each inlet and outlet of the cross junction (sector A) to measure instantaneous flow rate in the system. To ensure the precision of the measurement, a relative error was calculated for each test, a margin of error of 5% was considered acceptable.
- ten flow control valves (labelled 1-10), one valve at each inlet and outlet of sector A and three at the entrance of sectors B and C;
- ten water valves (labelled a-j), one at each inlet and outlet of sector A and three at the exits of sector B and C;
- two dosing pumps (BL3-12, HANNA instrument , Mexico) were used to control the chlorine concentration released from the storage tank;
- an advanced system (CL763, B&C electronics, Italy) that detects chlorine concentration in the range from 0.1 to 20 mg/L was installed in sector A (at inlets and outlets). This equipment is designed for inflow continuous measurement of residual chlorine in solution. A different chlorine measurement method was used in sectors B and C and;
- a data logger (EI-USB-4, Lascar electronics, USA) was connected to each controller. Schematic diagram of the experimental distribution network is shown in Fig 1.

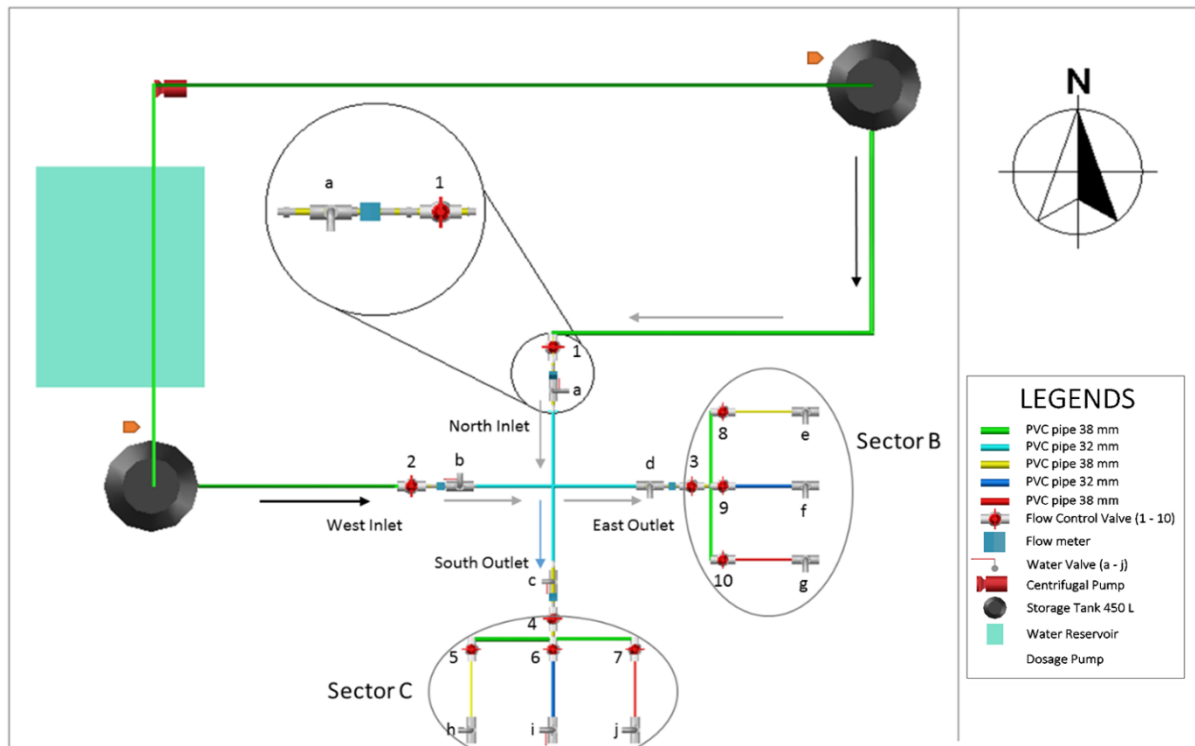

Fig. 1:- Schematic description of the experimental distribution network [sector A inflows at 90°]

In order to get a homogeneous mixture of tap water and chemicals (natural organic matter and chlorine), a manual mixer was installed at each storage tank (see Figure 2)

Fig. 2:-Schematic drawing of a manual mixer

Experimental procedure:-

To carry out the experiments, tap water from the reservoir was pumped to the elevated storage tanks using a 4HME200 centrifugal pump. K-Tonic solution (1.15 g/mL) which is a mixing of six compounds such as Total Nitrogen, Urea Nitrogen, K₂O water-soluble Potassium, Extract of Total Humic Carbon, Humic Acid Carbon and Fulvic Acid Carbon was used as contaminant agent. Then, 2.73 mL of K-Tonic solution were added to the North storage tank, which resulted in Total Organic Carbon (TOC) of 0.76 mg/L and 3.13 mL of the same solution (K-tonic solution) were added to the West storage tank to get TOC concentration of 0.87 mg/L. About 4.66 mL and 6.13 mL of sodium hypochlorite solution (at 13%) were added to the West and North storage tanks, respectively, which resulted in corresponding chlorine concentrations of approximately 1.35 mg/L and 1.77 mg/L. The solutions in each tank were mixed using a manual mixer.

The experiment provides varying inflows, varying chlorine and NOM concentrations. Prior to that, flow control valves 1 and 2 (of sector A) were maintained partially opened (approximately 50% and 75% respectively) to provide a flow rate of 0.50 L/s and 1.14 L/s at North and West inlets, respectively (Table 1). Flow control valves (from 6 to 10 of sectors B and C) were totally opened.

Instantaneous flow rates were measured at each inlet and outlet of sector A using the flow meters. Free chlorine concentrations were also measured at each inlet and outlet of sector A. Triplicate samples were collected at each sector for water quality analysis. Five minutes later, flow control valves 5, 6 and 7 as well as water valves e, f, and g of sector B were closed. Flow control valves (8, 9, 10) and water valves (h, i, j) of sector C were also closed at the same time. Thus, water was stagnated in sectors B and C. Once completed a period of time of eighteen hours, three samples were collected from pipe segments of sectors B and C for analysis of water quality. The experiment extended for about twenty-four hours.

Analytical Methods:-

Turbidity was measured using a turbidimeter (2100A, HACH, Mexico). Total organic carbon (TOC), Total Carbon (TC) and Inorganic Carbon (IC) analysis were carried out based on catalytic combustion at 720°C using a TOC-L CSH (Shimadzu Corporation, Germany). A 350 mercury thermometer was used to measure water temperature and an M530P (Pinnacle series, USA) unit was used for pH measurement. A DR 6000 UV-VIS Spectrophotometer with RFID Technology (HACH) was used for absorbance measurement, Total solids and Biochemical Oxygen Demand (BOD) were measured based on the methods for the examination of water and wastewater (APHA 1992), chlorine concentration of samples from sectors B and C was measured using the Iodometric titration method based on Na₂S₂O₃ titration. In this case, chlorine concentration was calculated using Eq. 1.

$$mgCl = \frac{(A \pm B) \times N \times 35450}{mL.sample} \quad [1]$$

where:

A mL titration for sample

B mL titration for blank

N normality of $Na_2S_2O_3$

Results and Discussion:-

Sector A:-

In the experiment, the flow at North inlet was blocked by the incoming water from the West inlet, which had greater flow (Table 1). This forced some of the flow (from North inlet) to get pushed across the junction and exit through the East outlet. This resulted in only slight mixing and had an impact on water quality characteristics at outlets. This results corroborated with those obtained by other researchers such as Chávez et al. 2005, Ho et al. 2007; Ho and O'Rear 2009 and Austin et al. 2008. Water quality parameters of sector A (cross junctions) are presented in Table 1.

Table 1:- Water quality parameters for samples from sector A

Sampling points	Flow rate [L/s]	Chlorine [mg/L]	pH	Abs UV	BOD [mg/L]	Total Solids [mg/L]	Turbidity [NTU]	TOC [mg/L]
North inlet	0.50	0.70	7	0.030	13.0	0.49	1.2	0.87
West inlet	1.14	0.35	7	0.026	10.5	0.36	0.9	0.76
South outlet	0.72	0.37	7	0.025	9.30	0.39	1.0	0.40
East outlet	0.92	0.53	7	0.020	13.0	0.43	1.1	0.69

Sectors B and C:-

Effects of incomplete mixing:-

Because of the incomplete mixing occurred at the cross junctions, physicochemical characteristics of the water varied in the same experimental setup. In the case of sector A, the level of disinfectant at East and South outlets was different. In general, water in the East outlet had higher values of free chlorine, Total Organic Carbon (TOC) levels, total solids, Biochemical Oxygen Demand (BOD), Turbidity that corresponded to the higher level of these parameters in the North storage tank. This is due to the fact that water in East outlet contained mostly water from North inlet and only a slight mix from the West inlet. Samples from sector B (which comes from East outlet of sector A) and sector C (which comes from South outlet of sector A) were collected after an incubation period of eighteen hours and taken to a laboratory for analysis of water quality. Results are presented in Tables 2 and 3 respectively.

Table 2:- Water quality parameters in sector B.

Sampling points	Chlorine [mg/L]	pH	Temperature [°C]	Turbidity [NTU]	TOC [mg/L]	TC [mg/L]	IC [mg/L]	BOD [mg/L]	Total solids [mg/L]	Abs UV
Initial water quality parameters of sector B										
	0.53	7	18.6	1.1	0.69	27.81	27.41	13	0.43	0.020
Final water quality characteristic of sector B										
Sector B	0.00	7	18.3	1.1	0.98	27.69	26.71	6.8	0.43	0.027

Table 3:- Water quality parameters in sector C

Sampling point	Chlorine [mg/L]	pH	Temperature [°C]	Turbidity [NTU]	TOC [mg/L]	TC [mg/L]	IC [mg/L]	BDO [mg/L]	Total solid [mg/L]	Abs UV
Initial water quality parameters of sector B										
Initial data	0.37	7	18.6	1.0	0.40	27.81	27.41	9.3	0.39	0.025
Final water quality characteristic of sector B										
Sector C	0.00	7	18.3	1.1	0.62	27.94	27.72	6.9	0.39	0.020

Results obtained in sectors B and C were aimed at understanding the effect of mixing phenomenon on the diffusion of physicochemical parameters in the network. As it can be seen water quality parameters in sectors B and C such as total organic carbon (TOC), total carbon (TC), inorganic carbon (IC), Biochemical Oxygen Demand, Total solids, absorbance UV, Turbidity were different.

As it can be seen, water quality characteristic measured in both sectors were different due to the incomplete mixing occurred in sector A. This phenomenon is perhaps the most important controlling factor influencing microbial diffusion in water distribution systems.

Conclusions:-

This study investigated water quality parameters at cross junctions that had incoming flows from different directions (90°). The study showed that incomplete mixing at cross junctions could lead to a heterogeneous diffusion of physicochemical water quality parameters. Results from this study are useful in understanding the effect of pipe configuration in distribution systems and help develop better management systems to address issues related to the variation of water quality parameters in the water distribution system.

Acknowledgments:-

This research was supported by the Engineering Institute at the National Autonomous University of Mexico, (Instituto de Ingeniería, Universidad Nacional Autónoma de México). Abstract

Taking the nation by surprise, Indian Government on 8th November,2017 announced demonetisation of Rs1000 and Rs 500 notes with effect from the midnight, making these notes invalid and the move was aimed at cracking down on the shadow economy.The immediate effect of the move brought the entire financial system to halt, hitting the large sections of the economy hard.The noble move by the government was indeed to control the counterfeit currency.This paper is based on the secondary data which was collected from various sources like published journals,articles,magazines and it elucidates the impact of such a move on the different sectors of the financial system.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction and History:-

Demonetisation means the withdrawal of the currency from circulation.The concept of demonetisation was not new.The first was when Rs 1000,Rs 5000 and Rs 10000 notes were taken out of the circulation in January 1946,a year and a half before the country won independence from the British.The Rs 10000 notes were the largest currency denomination ever printed by RBI,introduced for the first time in 1938.All three notes were reintroduced in 1954.In the early '70s,the Wanchoo Committee,a direct tax enquiry committee set up by the government,suggested demonetisation as a measure to unearth and counter the spread of Black money.However the public nature of the recommendation sparked black money hoarders to act fast and rid themselves of high denominations before the government was able to clamp down on them.Then in 1977 the Janata Party Coalition govt came into power.A year into the government's term,party leader Moraji Desai was more bullish about cracking down on counterfeits and black money.The high denomination bank notes(Demonetisation)act,instated by the ruling party on Jan 16,1978,deemed the Rs1000,Rs 5000 and Rs10000 notes illegal for the second time.The Rs 1000 note made a comeback in November 2000 and Rs 500 note was brought in to circulation in October 1987.But on November 8,2016 Rs 1000 and Rs 500 notes were demonetised with an aim to curb the black economy.The new series of Rs 500 and Rs 2000 banknotes are in circulation since 10 November,2016.

Why was the bold step taken by the Government? The government's stated objectives behind the demonetisation policy are as follows:

- First it is an attempt to make India Corruption free.
- Second it is done to curb the undisclosed money
- Third to control the escalating price rise
- Fourth to eliminate fake currency and dodgy funds which have been used by the terror groups to fund terrorism in India

Corresponding Author:- Parag Dutta.

Address:- M.Sc Mathematics(Gold Medalist), Assam University.

- Fifth to make people accountable for every rupee they possess and pay income tax return
- Finally it is an attempt to make a cashless society and create a Digital India

Though the Government pulled off a major coup today to check black money, it has laid its foundation much before. Though today's unprecedented financial measure may have come as a rude shock to many, Narendra Modi Government gave enough opportunities and threw enough hints in this regard. The following are the possible measures:

- In the very first Cabinet meeting, the first such initiative constituted a Supreme Court Monitored Special Investigation team (SIT) on black money.
 - The second such move was the launch of Pradhan Mantri Jan Dhan Yojana (PMJDY) on August 28, 2014. People were asked to deposit all their money in the Jan Dhan accounts and do their future transactions in banking methods only. Now that the 500 and 1000 currencies are banned and transactions from banks will acquire importance. Opening of accounts even in the remote areas will help the rural villagers. They will not feel the pinch of the banning of the currency notes. Had the bank accounts not been opened, the people would have faced immense problems. Till February 22, 2017 the total 27.77Cr accounts have been opened so far and Rs 64720.94 Cr has been deposited in these accounts. 22.22Cr accounts (Rural 12.18Cr+ Urban 10.04Cr) under Public Sector Banks, 4.65Cr accounts (Rural 4Cr+Urban 0.65Cr) under Regional Rural Banks, 0.90Cr accounts (Rural 0.54Cr+Urban 0.36Cr) under Private Banks have been opened.
 - The government renegotiated the Double Taxation Avoidance Agreement (DTAA) with Mauritius to impose capital gains tax if such capital asset is situated in India. The govt also negotiated an Automatic Information Exchange Agreement with Switzerland. Agreements are also being negotiated with other Tax Havens. From 2017, Organisation of Economic Cooperation and development (OECD) countries have agreed to share information on foreign account holders with their home countries.
 - The Undisclosed Foreign Income and assets (imposition of tax) Bill, 2015 will apply to Indian Residents and seeks to replace the income tax act 1961 for the taxation of foreign income. It penalizes the concealment of foreign income and provides for criminal liability for attempting to evade tax in relation to foreign income.
 - Income Declaration Scheme 2016 came in to effect from June 1, 2016. It's an opportunity for those who didn't disclose income or pay taxes thereon in the past. Under this scheme, such persons can declare the undisclosed income and pay tax, surcharge and penalty on the declared undisclosed income. The person making a declaration under the scheme will have to pay income tax at the rate of 30% of the value of undisclosed income plus a surcharge of 25% thereon. Additionally the person will be liable to pay a penalty at the rate of 25% of the tax, which would make the total payments 45% of the undisclosed income.
 - The govt also imposed a penalty of 20% on all cash transaction exceeding 20000 in Real estate to curb black money.
- However there were many who still hoarded the black money and in order to tackle them the govt announced the demonetisation of 500 and 1000 currency notes.

Mathematical calculation of the Process:-

Let us understand the process of demonetisation through some mathematical logic to predict the impact of demonetisation in the Indian economy.

Indian GDP is supposed to be 125-130 lakh crore

Cash circulation before demonetisation was 17.54 lakh crore = approximately 14% of cash to GDP ratio

Size of the black economy = 20% of GDP

= 20% of 125-130 Lakh Crore (approx)

= 25-28 lakh crore (approx)

Black cash in the system = 4.5 Lakh crore

Some prior studies kept the black cash = 3.35 lakh crore (instead of 4.5 lakh crore)

Total cash circulation in the system = 17.5 lakh crore

Total cash in 500 and 1000 Rs denomination = 86% of 17.5 Lakh crore (approx)
= 15 lakh crore

Black cash is worth = 4.5 lakh crore

Legitimate cash = (17.5 - 4.5) lakh crore
= 13 lakh crore

Assuming a figure of 5% of the cash to GDP ratio in line with other similar economies, it would like to see no more than 9 lakh crore cash in circulation of which around 2.5 lakh crore of cash was in small denominations in the system already before the exercise started. This essentially means that (9 - 2.5) = 6.5 lakh crore of cash is what the

Govt will replace in lieu of the Rs 15 lakh crore (in 500 and 1000 denominations) it will take out. Now if the logic stated above is correct we will see that Rs 15 lakh crore worth of high denomination notes will be replaced by 6.5 lakh crore of cash. But we cannot expect that all replacement will be in similar high denomination notes. It may be noted that, even before the new high denominations(500 and 2000) were introduced around 50000 crore cash of new cash was injected in small denomination notes. Now say the total new high denomination notes in cash is 4 lakh crore. Therefore apart from the 4.5 lakh of black money being burnt, we can expect that 6.5 lakh of high denomination notes(old 500+1000) notes will never come back in to the system.

Whether the process will work or will fail like 1978,1946? After the failure of First and second demonetisation that took place in 1946,1978 it is a question that now our third demonetisation will be a success or not. The major difference is in the quantum however. The first and second demonetisation affected really high value notes which formed a small part of the notes in circulation. If we consider per capita GDP of India now and earlier then we can arrive at a conclusion. In 1978 per capita GDP of India was approximately Rs 1700 whereas today it is approximately Rs 1 lakh. At that time it was really a great thing when people earned four digit salaries. The common middle class people did not even use much of higher denomination notes. Also circulation of fake notes were also very less. Probably a very large % of the population did not even know the move as there was no effective social media and even televisions were only found in few houses. No of Banks and branches were also very less compared to the present scenario. Black money at that time was very less as of now. So only about 15% of the currency got exchanged. Above reasons are the major reasons for failure in 1946 and 1978.

But now the situation is a lot different. The black money has increased drastically with no leaps and bounds. It was held mainly in form of Jewellery, Currency notes in denomination of 500 and 1000 which accounts for 85% of total currency and in real estate market etc and in the recent times the circulation of fake notes has also increased rapidly. Also IDS ,2016 was declared prior to the demonetisation which was a strong move against the black money. Most important thing is that now cashless move is adopted and so illegal way of transmitting money will be reduced. The govt is just in the beginning of effort against black money but it will surely be a success in the long run.

Impact of Demonetisation : Demonetisation effected various sectors of economy. Few are discussed as

- **Effect on Agriculture:** The move hit badly the farmers as people in cities could queue-up to exchange or deposit their old notes at banks but people staying at villages, miles away from cities are not in a position to carry out exchange or deposit properly. The entire agricultural system runs on cash and the poor farmer might become the worst casualty in this drive. Not only are farmers likely to find it hard to pay off their debts, they may not get any further credit for processing seeds and other inputs for the next sowing season. The situation is exacerbated by the fact that poor sections are reportedly being used as middle man to exchange old notes for new by the black money hoarders.
- **Effect on Real Estate:** The real estate sector, especially the secondary market, has virtually come to a standstill. Black money has been to the Indian real estate sector, what foreign institutional investors have been to the stock markets. Much of the boom of the Real Estate sector has been due to the proliferation of the black money, which accounts for anywhere from 30% to 40% of the secondary market. With black money being sucked out of the market, real estate prices in bigger cities should see a correction of 30%.
- **Effect on Gold and other precious metals:** After demonetisation the demand for gold and other precious metals has increased greatly because people with black money trying to invest in gold to make it white. But the govt has said that it is aware of this and is cracking down with tax raids on jewellers across the country. Moreover jewellers will be required to produce details of any cash transactions. In the long run though with cash being sucked out of the system, sales will take a hit, as most jewellery purchases are done using cash.
- **Effect on anti social funding:** Money laundering is one of the important financial mechanism for terrorists. The antimoney laundering investigation fails when the money trail leads to cash. In India the terror finance trail starts and ends with cash making it impossible to get early alerts of terrorist active in the country. Demonetisation will upset the financing chain for the terrorists as all the money will get back to the banks and from there it is easy to identify the fake currency.
- **Effect on Political funding and donations:** Demonetisation has badly affected the political parties. After the note ban, the govt also put some restrictions regarding the party fund and donations. Anonymous donations are going to get identified now and upcoming 2017 elections will be transparent to some extent.

India's Way to the Cashless: The demonetisation drive has forced millions of Indians to fall in line with Narendra Modi Govt's Cashless move. The immediate impact of demonetisation is seen across the country where even small

traders took to digital modes of transactions including E-wallets ,POS terminals etc.The consumer class also found prices of commodities like pulses,edible oil,fruits and vegetables coming down in retail market.Perhaps the biggest beneficiaries are Paytm,Freecharge and Mobikwik. Digital payments have increased in the range of 400 to 1000 percent since November 8th.Transactions on Rupay cards have increased from 3.85 lakh per day to 21 lakh per day and the value of transactions have increased from 39.17crore to 282 crore.Net percentage change is 445% in terms of subscribers and 620% in terms of transactions.

E-wallets have increased from 22 lakhs per day to 75 lakh per day and the value of transactions have increased from 88 crore to 296 crore.The net percentage change is 240% in terms of subscribers and 236% in terms of Transactional value.

Transactions on UPI have increased from 3721 per day to 76700 per day and the value of transactions have increased from 2.93 crore to 35 crore.The net percentage change is 1961 % in terms of subscribers and 1095 % in terms of Transactional value.

Transactions on USSD platform have increased from 97 per day to 4976 per day and the value of transactions have increased from 1 lakh to 57 lakh. The net percentage change is 5000% in terms of subscribers and 1095 % in terms of Transactional value which is quite high.

Transactions on POS Terminals have increased from 50.23 lakhs per day to 98.1 lakhs per day and the value of transactions have increased from 1221 crore to 1751 crore. The net percentage change is 95% in terms of subscribers and 43% in terms of Transactional value.

Detailed Analysis of Digital Transaction:-

Demonetisation Impact on Cashless Transaction						
Mode of Transaction	Record on 8th Nov		Record on 26th December		Total % Change	
Rupay Card(lakhs)	3.85		21		445.4545	
Total Value(Crore)	39.17		282		619.9387	
E-Wallet(Lakhs)	22		75		240.9091	
Total Value(Crore)	88		296		236.3636	
UPI platform	3721		76700		1961.274	
Total Value(Crore)	2.93		35		1094.539	
USSD Platform	97		4976		5029.897	
Total Value(lakh)	1		57		5600	
POS Terminal(Lakhs)	50.23		98.1		95.30161	
Total Value(Crore)	1221		1751		43.40704	

Conclusion:-

It can not be told now clearly that whether the ban on 500 and 1000 notes will completely eradicate the black money or not but it is just one move of one piece in the chess board of black money. To checkmate the black money king, have to win the board. The effort of the govt was supported by majority of common people. Although the process did not prove that much success but a good sign is the move to the Cashless. Since demonetisation was carried out to curb the black money and soon after the move to digital transaction will surely portray some good result. Since with digital transactions money will come into the system, it will be accountable, generate tax and help develop the country's economy. When money will come in to the banks the govt will be able to come up with better welfare schemes. The govt will significantly benefit from the additional cash that is pushed in to the system. There will also be a much higher collection of income taxes and other taxes by the govt. More than short term benefits, there is an angle of long term GDP growth which will positively impact our economy by around 2018. To sum up a little patience will go a long way in making this demonetisation growth a success. The inconveniences or difficulties of time consuming, currency exchange and reduced withdrawal limits at ATMs and Banks will gradually pave the way for a more resilient economy. The entire process in turn will not only benefit us individually but as a nation proceeding towards a glorious future.

Key words:-

drafting, revising, writing process, proofreading.

Abstract

This qualitative study reports features of drafting, revising and strategies to write an English essay. The study was done in State Islamic Institute (IAIN) Surakarta, Indonesia on January to April 2015, assigning 30 students as the research subject. The study revealed that in drafting and revising process in writing were differently produced by lower, middle and upper groups. Lower group did not write outline and produced first draft without planning. Thesis statement, topic sentence and concluding paragraph did not appear. The middle group was able to produce thesis statement, body paragraphs and conclusion, but they focused less on revising and proofreading. The upper group exhibited by performing all aspects of an essay in each rhetorical patterns. Drafting and revising were used appropriately. All groups asserted literal translation to develop ideas and overcome problems on diction.

Introduction:-

Good writing is essential for success in school and the 21st Century workplace. Writing is a complex combination of skills which is best taught by breaking down the process. The writing process involves a series of steps to follow in producing a finished piece of writing. Focusing on the process of writing, almost everyone learns to write successfully. By breaking down writing step-by-step, the mystery is removed and writer's block is reduced. Most importantly, students discover the benefits of constructive feedback on their writing, and progressively master, and even enjoy, writing (Time4 Writing, 2016).

The writing process—prewriting, drafting, revising and editing, rewriting, publishing—mirrors the way proficient writers write. Studies show that students who learn the writing process score better on writing tests than those who receive only specific instruction in the skills assessed on the test. Success in writing greatly depends on a student's attitude, motivation, and engagement. The writing process takes these elements into account by allowing students to plan their writing and create a publishable, final draft of their work of which they can be proud (ILA/NCTA, 2017:1).

When teaching expository essay in Indonesian contexts, empirical evidences appear pertaining to quality of rhetorical patterns. There is still a debate if process of writing is emphasized, attentions in the language revision will decline and improvements on grammar are limited. Conversely, if language corrections take priority, writing process is delayed.

For many students, writing can be intimidating, upsetting and mystifying but writing process answers this problem. Every writer follows his or her own writing process (Pouladian, et. al. 2017). Therefore, process writing has been

Address:- State Islamic Institute of Surakarta, Indonesia.

considered as writing technique that suffices benefits in the teaching process. According to Krashen (1984:21) convention as a model is required in process of writing. To maintain how to write for newspaper, read newspapers; textbooks about them will not suffice. For magazines, browse through magazines rather than through correspondence courses on magazine writing. To write poetry, read it. For the conventional style of memoranda in a school, consult school file.

Research Questions:-

- 1) How is the feature of revising and drafting the English essay by Indonesian EFL learners?
- 2) How are elements of introductory paragraph, body paragraphs and concluding paragraph in an essay by Indonesian EFL learners?
- 3) What strategies are used by Indonesian EFL learners to develop an essay?

Review of Literature:-

Process Writing:-

Historically, educators have struggled how to write well, focusing on the finished product. Since the 1970s, teachers no longer emphasize the finished product; instead, they teach the writing process. Researchers discovered that writing was a highly complex process, made up of various sub-processes that had a strict linear sequence and varying patterns (Caudery, 1995). Good writers differ from poor writers in their composing process, that is, they have better and more sound procedures for getting their ideas down on paper. Specifically, good writers differ in three ways: in planning, rescanning, and revising (Krashen, 1984:12).

Writing is recursive and any of the steps can be repeated. The term *recursive* refers that writers can engage in any act of composing--finding ideas, thinking about ways of organizing them, imagining ways of expressing them--at any time during writing and often perform these acts many times while writing (Wingersky, Noerner, & Holguin-Balogh, 1992; Langan, 1992). In addition, Krashen (1984:17) asserts writers employ recursive: writing a draft may be interrupted by more planning, and revision may lead to reformation, with a great deal of recycling to earlier stages. According to Caudery (1995) students can start the process from brainstorming, prewriting outline or collection of ideas in their head. Students also create a topical outline to help organize their ideas, and to develop a working thesis statement.

Weaknesses and benefits of writing process exist, however. Because the emphasis is on the process of writing, much of the sensitivity about receiving constructive criticism is eliminated. The strength is its usefulness for a wide range of diverse learners. Students are taught a variety of styles to structure their thinking, ranging from analytical outlines to highly visual graphic organizers. Students explore ways for organizing and visualizing their ideas that is the most effective for them.

Steps of Process Writing:-

Simply, process writing consists of five steps to write a piece of writing product. Often the process is a routine that comes naturally and is not a step-by-step guide to writer. Here are five steps of the writing process.

Pre-writing:-

Prewriting is a planning phase in writing process. Here students brainstorm, research, gather and outline ideas in terms of diagrams for mapping out their thoughts. Students also address audience and purpose, and formulate a thesis statement for the writing. Prewriting includes: (1) Deciding on a purpose, or reason, for writing. (2) Thinking about the audience's needs and interests. (3) Choosing a subject for writing. (4) Limiting the subject to a suitable topic. (5) Gathering information on the topic. (6) Organizing the information (Langan, 1996).

Drafting:-

The second process of writing is composing a first draft or rough draft. A *draft* is the rough form of a piece of writing. Definitely, drafting is writing the first version of ideas on a paper without thinking right or wrong the ideas are. Writing the first draft is expressing ideas in sentences and paragraphs. Drafting involves taking information the writer has generated and organized in an essay. The writer consciously starts with main ideas and adds supporting ideas that flow smoothly (Wingersky, Noerner, & Holguin-Balogh, 1992). Students create initial composition by writing down all their ideas in an organized way to convey a particular idea or present an argument. Audience and purpose are finalized later.

Revising:-

Revising means to see again. Revising is a big change like wording, adding sentences, and moving paragraphs. In writing, revising is making changes to improve the first draft by moving around words, phrases, and ideas. Writers review, modify, and reorganize their work by rearranging, adding, or deleting content, and by making the tone, style, and content appropriate for the intended audience (Warriner, 1988; Langan, 1998; Nordquist, 2015). When revising, a writer is changing the meaning or way in which the reader perceives, experiences and interprets it.

Prior to revising, a writer does an evaluation on the paper, that is, re-examining ideas, organization, and word choice in the first draft (Langan, 1996). A space for improvement appears in the first draft and to improve this, the writer evaluates or makes judgements on strengths and weakness of the draft to see intended purpose of the paper, organization, clarity, and appropriateness to its audience (ILA-NCTE, 2017). See Table 1 for the guideline of evaluating a paper.

In addition, revision focuses on the whole paper. It may change several points: point of view, tone of paper, order of paragraphs, eliminating one of the paragraphs completely, adding a whole new idea, and changing conclusion (Nordquist, 2015). Revising naturally adopts the ARRR approach:

Add: number of words or details required, e.g. 350 or 3,500 words

Rearrange: organization or contents of the paper appropriately

Remove: making changes, organization, rearrange ideas, eliminate passages

Replace: enough details, any contradicted facts

Table 1:- Guidelines for Evaluating Writing (Warriner, 1988:32-33)

Contents		
1	Purpose	1. Do all the ideas help to achieve a main purpose (explain, tell a story, describe, or persuade)?
2	Topic	2. Is the topic suitably limited for the form of writing?
3	Audience	3. Are the topic and details suitable for the audience?
4	Development	4. Is enough information given to understand the topic? Is too much given—does it all “belong?”
Organization		
1	Coherence	1. Does the order of ideas fit the purpose? Will this order make sense to the reader?
2	Transition	2. Are ideas clearly connected, with words such as <i>also</i> , <i>first</i> , <i>these</i> , <i>however</i> , and <i>therefore</i> ?
Style		
	Words Choice	1. Are exact and vivid words used?
		2. Does the vocabulary fit the audience and purpose?
	Sentence Variety	3. Do the sentences vary in length and how they begin?

Table 2 is presented to show how revising activities and its focus should work in a small scope.

Table 2:- Revising focus on a paper (Adapted from Monica (1996), Student Learning Center, University of California, Berkeley).

No	Focus of Revision
1	A paper as a whole: strengths, weaknesses, arguments, focus, organization, support, voice, and mechanical issues
2	Dialogue-based, the purpose or revision is to ask questions, expanding ideas and challenging arguments which require discussion between the writer and the reader
3	Non-hierarchical, offering questions and making observations, allow the writer and reader to hold separate and valid opinions. The purpose is to expand and clarify ideas rather than correct them
4	focuses on the writer in the process of writing and increasing the writer's understanding of the paper's strengths and weaknesses
5	Clarifies and focuses the writer's arguments by defining terms, making concessions and counter-arguments, and using evidence; moving or removing entire paragraphs, extending or narrowing ideas, rewriting vague or confusing text, and adding to existing paragraphs

More complete version of revising activities, Table 3 is presented as a guidance of revising for a paper in a broader context.

Table 3:- Revising a Draft (adopted from Warriner, 1988: 35-36)

No	Problem	Techniques	Revision
1	Purpose is not clear	Add/Cut	Make sure you know your purpose. Add details that fit it. Remove comments that do not fit it.
2	The ideas are too general	Replace	Make general ideas more specific. Do more research, if needed. Be sure the topic is not too broad for the form of writing.
3	Some information is "extra" or not related to the main idea.	Cut	Remove "padding" and unrelated ideas. Keep only the background needed by the particular audience.
4	It is hard to follow the ideas.	Reorder/Add	Move sentences or paragraphs to fit what a reader needs to know first, second, and so on. Add linking words such as <i>this</i> , <i>when</i> , <i>then</i> , <i>these</i> .
5	Some terms are too complex or too simple for the audience.	Add/Replace	Add definitions to explained unfamiliar terms. Change the wording to fit the audience's age and background.
6	The beginning is dull	Add	Add examples, incidents, or other details that will interest the audiences. Be sure the topic will interest the audience.
7	Some words are vague or overused.	Replace	Replace words that stand for a group of things with more exact words. Use exact, vivid adjectives, adverbs, and verbs.
8	Some wording seems very informal.	Cut/Replace	When light, informal expressions do not fit the purpose and audience, remove slang, contractions, and so on or replace them with standard formal words.
9	The sentences are monotonous.	Replace/Reorder	Combine choppy sentences. Split rambling sentences. Change the word order so sentences begin in different ways.

Editing:-

Editing begins as soon as a writer finished the first draft. Editing is rereading draft to see whether paper is well-organized, transitions between paragraphs are smooth, and evidences really fit the argument (Langan, 1996). Editing takes place in two ways: *First*, editing focuses on errors on punctuation, grammar, and spelling. In this stage, editing a manuscript focuses only on the structure of writing that is to be corrected. These are minor changes that include: spelling, grammar, punctuation, sentence structure. The overall text remains exactly the same because an editor simply corrects mistakes in the paper, such as typos, grammar errors, and spelling mistakes (Time4 Writing, 2016). *Second*, editing undergoes with linkages of developments and connections of ideas in the whole paper. This way, level of editing includes: contents (claim, argument, evidence, relevant goal), overall structure (thesis statement, introduction, body, conclusion, logical sequence, transitions between paragraphs), and structure within paragraph (clarity, style, citation) (The Writing Center at University of North Caroline. 2014). Table 4, shows activities how an editing a paper should work.

Table 4:- Focus of Editing (Adapted from Monica (1996), Student Learning Center, University of California, Berkeley).

No	Focus of Editing
1	A sentence level, addressing problems with spelling, grammar, punctuation, or word choice
2	One-sided: The editor writes comments and corrections on the paper and returns the paper to the writer
3	Hierarchical: An editor looks for "mistakes" and "fixes" them. An editor places value on writing (such as a grade)
4	Focuses on the paper as a product

After editing, the editor's job is proofreading. Errors in spelling, grammar, usage, or mechanics can distract the reader from the ideas in the paper. At this point, writers proofread and correct errors in grammar and mechanics, and improve style and clarity. It's time to fine tune the manuscript line by line by checking for repetition, clarity, grammar, spelling and punctuation. Proofreading consists of checking for errors in grammar, usage, mechanics, and correcting errors. The result of conscientious proofreading is a final draft—the finished product (Time4 Writing, 2015; Nordquist, 2015).

Proofreading is different from revision. Proofreading is the final stage of the editing process, focusing on surface errors such as misspellings and mistakes in grammar and punctuation. Proofreading is done only after all editing revisions are finished. *Proofreading* is finding and correcting mistakes in grammar, usage, and mechanics. *Usage* means using words correctly according to the rules for standard written English. *Mechanics* includes capitalization, punctuation, and spelling (Langan, 1996). See Table 5 for the guidelines of proofreading.

Table 5:- Guidelines for Proofreading (adopted from Warriner, 1988: 39)

No	Focus to proofread
1	Do plural verbs have plural subjects? Do singular verbs have singular subjects?
2	Are verbs in the right form and tense?
3	Are the verbs <i>sit/set</i> , <i>rise/raise</i> , and <i>lie/lay</i> used correctly?
4	Are subject and object forms of pronouns used correctly?
5	Are adjective and adverb forms used correctly in comparison?
6	Are double negatives avoided?
7	Do all sentences and proper nouns and adjectives begin with a capital letter?
8	Are all words spelled correctly? Have spellings been checked in a dictionary?
9	Is the punctuation correct at the ends of sentences and within sentences?
10	Is every sentence a complete sentence?

Publishing:-

Publishing is the last step of the writing process. Publishing is making the final copy of the paper into a correct form. Publishing for English teachers and students means the completion of the cyclical writing process for a specific product. The writer prepares a document to be distributed to an audience. This may involve printing the work or duplicating it in print or online.

Writing Process in This Study:-

Overall writing process is presented in Figure 1. Parts of this process cannot operate at the same time, even if the writer is skilled and the writing task is easy. Altogether they represent what is called the writing process that is recursive, which means going back and forth. Writing process in this study includes three steps and two activities of writing: drafting and revising.

Drafting

- a. Stage One : Exploring-Experimenting-Gathering information
- b. Stage Two : Writing the controlling idea/Organizing and developing support

Revising

- c. Stage Three : Writing-Revising-Editing.

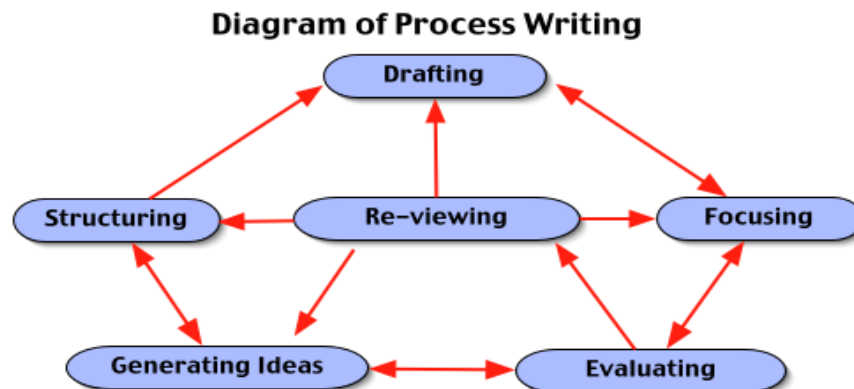

Figure 1:- The Process of Writing (from: *Process Writing* by Ron White and Valerie Arndt, 1991.)

English Essay:-

An essay is a piece of writing several paragraphs long. An essay is usually divided into several paragraphs, tying together an introduction, body and a conclusion (Oshima and Hogue, 2006). An essay is a short piece of non-fiction writing that often requires a number of skills such as close reading, analysis, comparison and contrast, persuasion, conciseness, clarity, and exposition (Langan, 2009). The purpose is to develop ideas and concepts more formal, concise, clarity in purpose and direction.

Standard short essay is between 350 and 500 words long; usually has one paragraph of introduction, a three-paragraph body, and one paragraph of conclusion. Some essays have two to three paragraphs, others have twenty or thirty. The essays written in class contain from four to six paragraphs, with the most common number being five: one introductory paragraph, three developmental paragraphs, and one concluding paragraph (Smalley and Ruetten, 1982:139). A-500 essay is equal to one page A4 paper for single space. A long essay such as paper or journal article may consist of 3,500 to 6,000 words long or 8-10 pages typed in a single space format. Organization of the paper normally includes: title, author name, abstract, introduction, review of literature, methodology, findings, discussion, conclusion and reference (Solikhah, 2017).

The introduction, the first section of an essay, is usually one paragraph that introduces topic to be discussed and central idea (the thesis statement) of the essay. The purpose is to arouse interest and introduce the controlling idea of an essay and states the main idea and thesis statement. The thesis statement is called the controlling idea that brings an essay into focus, giving it direction and drawing its ideas together (Kirsznier and Mandell, 1978:5).

The body paragraphs are the longest section of an essay. In a short essay, there are usually three body paragraphs, each one considering in detail one aspect of the essay's controlling idea. This is called a three-point essay. These paragraphs develop various aspects of the topic and the central idea. They may discuss causes, effects, reasons, examples, process, classification, or points of comparison and contrast. They may also describe or narrate (Smalley and Ruetten, 1982:139).

The concluding paragraph is the end of an essay that concludes the thought developed in the essay as the closing word. The ideas in the conclusion must be consistent with the rest of the essay. In the conclusion, the writer should draw together all that has come before by restating the controlling idea of the essay. This statement is usually most effective when it is located at the beginning of the conclusion (Kirsznier and Mandell, 1978:7).

Methodology:-

Research Design:-

This study used descriptive design with qualitative approach aiming to explain writing process on the accomplishment of expository essay. Writing process in this study was restricted into two kinds: drafting and revising. Descriptively, the study delineated drafting and revising in terms of frequency and rate percentage; in addition, elaboration of the rate percentage was done through explanation on the statements of writing comments. This study took place in English department at State Islamic Institute (IAIN) at Surakarta, Indonesia and conducted from January to April 2015.

Research Subject:-

Subjects of this study were senior 30 students learning in the sixth semester of English Language Education program of IAIN Surakarta joining in Writing Class. As this research ended, there were 5 students absent so the final number of participants were 25 students, 17 female and 8 male. Subjects were all at about to have similar competence in writing as all have received courses on Paragraph Writing, Essay Writing and Academic Writing at respective previous semester prior to this research was conducted. To this end, their knowledge on writing convention, academic writing, process of writing, and strategies of writing was equal among students. Subjects were all aware that they were incurred in the research class of writing the researcher conducted and they received treatments on the same materials.

Research Instruments:-

Instruments of this study were Writing Prompt on Expository Essay, Checklist to Assess Expository Writing, and Interview Guide. Writing prompt was used to see writing students worked. The expository test asked students to write an English essay of 5-10 paragraph with 350 to 750 words length. The mode of the essay was expository that explained a topic the researcher determined in the writing prompt. The essay checklist was used to evaluate the availability of the components of the essay After each essay was evaluated by raters and scores had been provided in each essay, the researcher classified the essay into three categories: low, middle and high. Based on the quality, the researcher interviewed to the subjects to see the strategies, process, and the works during preparations on drafting and revising process in developing the essay.

Data and Sources of Data:-

Sources of data in this study was Expository Essay obtained from the test of writing done by the research subjects. The essays were assessed and scored its quality. Therefore, data of the study comprised of quality of the introductory paragraph, the body paragraphs, and the concluding paragraph. Data on elements to support good introductory paragraph (e.g. thesis statement), the body (e.g. transition words, details, coherence) and the concluding paragraph (e.g. restatement of topic) were also identified.

Data Analysis Techniques:-

Data of this study consisted of two main concerns: frequency account and narrative accounts. First of all, the essays were scored and were identified their rhetorical patterns. The presence of account on each rhetorical patterns and its components were identified. Frequency data were used for two main concerns of analysis; First, it indicated frequency used by low, middle, and upper students during drafting and revising process to include in the rhetorical patterns; *Second*, it showed an account of how each group of the subject used elements of rhetorical patterns to build good introductory paragraph, the body and concluding paragraph.

In addition, exploration on comments and opinions of the subjects obtained through interview was used to collect narrative data. The interview described subjects' testimony on how they worked during the process of writing. Data of this view were categorized into strategies, problems, challenge and attitude during the writing expository essay in this study.

Results:-**Drafting and Revising the Essay:-**

Table 5 summarizes frequency of account on drafting and revising to develop an essay. Analysis was focused on frequency of correct form in drafting and revising to develop rhetorical patterns of an essay.

Table 5:- Drafting & Revising to Develop Rhetorical Patterns

No	Process	Rhetorical patterns	Lower (5)		Middle (14)		Upper (6)	
			F	%	F	%	F	%
1	Drafting	1. Introductory paragraph	1	20	7	50	6	100
		2. Body paragraph	3	60	12	86	4	67
		3. Concluding paragraph	1	20	13	93	5	83
2	Revising	1. Introductory paragraph	2	40	12	86	6	100
		2. Body paragraph	4	80	10	71	5	83
		3. Concluding paragraph	3	60	12	86	5	83

As table 5 shows attainment of lower, middle and upper groups in developing rhetorical patterns increased in the frequency of subjects. Lower group showed low empowerment in drafting but improved in revising. Similarly, middle and upper groups also improved their accomplishment in developing essay in the revising process.

Characteristics of rhetorical patterns in drafting and revising process of lower, middle and upper groups are as follows:

1. Lower group
 - a. Drafting process: low introductory paragraph (20%), fair body paragraphs (60%) and low concluding paragraph (20%).
 - b. Revising process: low introductory paragraph (40%), very good body paragraph (80%), and fair concluding paragraph (60%).
2. Middle group
 - a. Drafting process: low introductory paragraph (50%), very good body paragraphs (86%) and very good concluding paragraph (93%).
 - b. Revising process: very good introductory paragraph (86%), good body paragraph (71%), and very good concluding paragraph (86%).
3. Upper group
 - a. Drafting process: excellent introductory paragraph (100%), fair body paragraphs (67%) and very good concluding paragraph (20%).
 - b. Revising process: excellent introductory paragraph (100%), very good body paragraph (80%), and very good concluding paragraph (83%).

Rhetorical Patterns of the Essay:-

Elaboration of rhetorical patterns was done in this section. Components of introductory paragraph, the body and concluding paragraph were rated. The findings on Table 6 showed that lower group achieved lower attainment to induce rhetorical components to make quality of the introduction better. In addition, middle and upper groups exhibited from the lower group. Upper group even 100% of the subject succeeded to develop parts of one of the rhetorical patterns.

Table 6:- Description on Rhetorical Patterns

No	Rhetorical elements	Lower (5)		Middle (14)		Upper (6)	
		F	%	F	%	F	%
1	Introductory paragraph						
	1. Introductory sentence	3	60	10	71	6	100
	2. Thesis statement	2	40	8	57	5	83
	3. Topic sentence	1	20	8	57	5	83
	4. Controlling ideas	-	-	8	57	5	83
2	Body paragraph						
	1. Transition words within and between paragraphs	3	60	10	71	6	100
	2. Has a topic sentence	1	20	9	64	6	100
	3. Using appropriate details or synthesis	1	20	7	50	4	67
	4. Only one main idea in each paragraph	-	-	4	57	5	83
	5. Supporting sentences directly relate to main idea	-	-	3	21	5	83
3	Concluding paragraph						
	1. Restate the controlling idea	1	20	9	64	6	100
	2. Have a final closing statement	-	-	7	50	5	83

Characteristics of rhetorical patterns in the the essay made by the the lower, middle, and upper groups are as follows:

1. Lower group
 - a. Introductory paragraph: introductory sentence is fair (60%) but thesis statement and controlling idea are low (20%)
 - b. The body paragraphs: transition words is fair (60%), topic sentence and details are low (20%). Other components did not appear.

- c. Concluding paragraph: restatement is low (20%) and closing statement is absence.
- d. Middle group
- e. Introductory paragraph: introductory sentence is fair (60%) but thesis statement and controlling idea are low (20%)
- f. The body paragraphs: transition words is fair (60%), topic sentence and details are low (20%). Other components did not appear.
- g. Concluding paragraph: restatement is low (20%) and closing statement is absence.
- h. Upper group
- i. Introductory paragraph: introductory sentence is excellent (100%), thesis statement, topic sentence, and controlling ideas are good (83% each).
- j. The body paragraphs: transition words and topic sentence are excellent (100% each), detail is fair (67%), one main idea in one paragraph and supporting sentences relate to main idea are good (83% each).
- k. Concluding paragraph: restatement is excellent (100%) and closing statement is good (83%).

Writing Strategies:-

Results on writing strategies were obtained from structured interview. The focus of interview was to explore students' problems in writing an essay and in developing parts of the essay, e.g. introductory paragraph, the body and concluding paragraph. Strategies to overcome the problems were reported on the basis of level of attainment of the groups: lower, middle, and upper. The results of analysis were presented into drafting process that included: generating ideas, outlining, and writing the first draft; and revising that consisted of editing and proofreading.

Interviews with research subjects showed that students' problems in essay writing included: convention, rhetorical patterns, word-for-word translation, lack of content knowledge, grammatical errors, cohesion errors, lack of proofreading, and lack of academic style. Word-for-word translation is the most common problem to any students. A large number of the students literally translated Bahasa Indonesia into English when writing the essays.

The following are writing problems and solutions the students undergo that is ranked based on the results of interview.

Problems to write:-

1. Arranging ideas and structuring in plan to write
2. Outlining
3. Writing the first draft
4. Limited vocabulary
5. Lack of model
6. Grammar and sentence construction
7. Thesis statement in the introductory paragraph
8. Confused between thesis statement and topic sentence in a paragraph
9. Developing details in the body paragraphs
10. Citation or quotation
11. Making conclusion in a sentence and in a paragraph
12. Revising, editing and proofreading

Strategies to overcome:-

1. Translating
2. Consulting with bilingual dictionary
3. Referring to essay model
4. Browsing from internet and adopting the model
5. No outline, no revision, no editing, no proofreading
6. Stating outline, revising, editing and proofreading individually and with peer
7. Revisiting to achieve final copy for publishing or submission
8. Consulting with references online or in prints
9. Revising drafts several times to improve organization, parts of essay and substance
10. Controlling appropriateness among introductory paragraph, body paragraph, concluding

paragraph; thesis statement, topic sentence in the body paragraph, developing details, transition words and conclusion.

During drafting process, some students worked with outline and generated ideas through discussion or reading sources. Some worked in mind and some wrote on paper. There were different strategies used by lower, middle and higher students to develop the essay and its specific parts: the introductory paragraph, body paragraphs, and concluding paragraph.

Lower Group:-

Planning in this study means the first process students used to generating ideas, outlining and drafting. The results show that lower students caught ideas by recalling any experiences and did not write an outline on paper. Writing an outline was very difficult and time consuming for the lower students.

Excerpt (1) testifies how lower group planned writing and wrote an outline in the drafting an essay.

I did not write an outline before writing the essay. I tracked ideas from mind and wrote whatever I remember and knew on paper. I don't think about appropriate topic but the most important is I write down the ideas on paper. (L-1-DRAF)

Students of lower group also reported that planning was annoyance and took too formal and long time. Some focused too much on the outline and stared at the blank format of the outline. To write the first draft of the essay based on the outline was other difficult matters for lower students. *First*, stating thesis statement in the outline was complicated. *Second*, rhetorical patterns of an essay that consists of introductory paragraph, body paragraphs and concluding paragraph became obstacles to express ideas on the paper as seen on quote (2).

I write an outline but I cannot use as guideline of ideas on my paper. I just dropped my thought on paper, read at glance and submitted to the lecturer. I did not reread the text nor revised the contents. If I found any grammar or sentence errors, I corrected on the items that were wrong, not on the sentence or on the context. (L-2-REV).

More problems for lower group pertain to revising, editing, and proofreading. For them, revising is hard to do and they are not fully aware that revising gives benefits to improve the quality of an essay. Errors on grammars, sentences, organization, and structure of the essay are ignored by the low group.

Middle Group:-

Middle group exhibited from lower group in terms of drafting and revising strategies. *First*, drafting process was considered important for the students and they planned through outline. Thesis statement of the essay was developed and links to support the thesis in each body paragraph were incorporated. *Second*, in revising process, students made editing and proofreading with peers or by themselves. Though focuses of revision were limited, middle group students proceeded the steps of revision as the writing process suggested. Excerpt (3) testifies how middle group student maintains his thought on planning.

I am fully aware that drafting is very initial writing. Many errors in grammar, sentences, and ideas are found. Sometimes, it is very difficult to write correct sentences in drafting and I have to stop so long time to find the best words or sentence. It is bored. But, I have to do with the outline and follow ideas that I have planned. (M-3-DRF).

In addition to revising process, middle group students claimed that they improved quality of their essay from revising process. Editing is helpful to identify errors and correct the substance of the essay. They edited grammars, dictions, sentence variation, and mechanics as the first priority. The next, they revised rhetorical patterns and their contents. See quote (4) as for the example.

Revising is very important for me. I can correct many errors on sentences, for example, tenses, passive voice, plural. I can also revise the patterns, that are introduction, developing paragraphs, and conclusion. If we don't check the contents of introduction, body paragraphs, and conclusion, the results may be bad. Thesis statement does not match to the body and conclusion. (M-1-REV).

Upper Group:-

Accomplishment on essay of higher group is better than middle and lower group. Indication was shown from the quality and strategies used by the higher group in the drafting and revising process in writing the essay.

In the drafting process, most students in higher group were aware of the presence of outlining. They asserted that prior to writing the outline, they browsed and generated ideas to focus the topic. They formulated thesis statement as a claim of the essay and tried to find evidences to support the claim. Relying on the outline, they formally drafted the essay as the outline suggested. See excerpt (5).

To me, selecting certain topic is very important. I usually browse through internets or discuss with friends about the topic I am going to write. Initially, I jot down the ideas on a paper as an outline then I revise if I think new ideas are better. I will write confidently if I consider that my outline is complete. (H-1-DRAF).

Actions with care on revising process were stated by the higher group students. Surprisingly, higher group students did all aspects in the revising process: evaluating the paper, editing, revising and proofreading. In the evaluation process, students focused to see rhetorical patterns. Identification on thesis statement, topic sentence, developing details in introductory paragraph, body paragraphs, and concluding paragraph was done. The next, students checked any errors in the whole texts. The last step, students asked their peers and teachers to proofread the paper.

Overall, results of interview revealed that majority of students literally translated from L1 to English when writing English essays. The students seemed to be bothered by lack of vocabulary knowledge. Literal translation was done for two main causes: use of bilingual dictionaries and lack of exposure to English materials. Lack of exposure resulted word-to-word translation and writing deficiencies including grammar errors, cohesion errors, and lack of academic style.

Discussion:-

Writing quality is affected by strategy use. Processes for writing differ from one writer to another and from one situation to the next (Reid, 1992). However, three basic stages of writing process are common: pre-writing, drafting, and post-writing through which writers practice a number of strategies. Pre-writing includes generating ideas relevant to the subject (Dupont, 2004). Drafting involves writing the first version and composing thoughts in sentences and paragraphs (Winterowd & Murray, 1988). Post-writing stage cleaned up errors such as spelling, omission, extra spaces, formatting, and punctuation errors (Dupont, 2004).

Writing is a multidimensional communicative process, concerning “the generation, analysis, and synthesis of ideas; the organization of discourse; the control of sentence structure; the vocabulary, spelling, and mechanics” (Williams, 2007:12). Writing is related to emotion, cognition, motivation, logical reasoning, linguistic skills and contextual adaptation; it is also based on sufficient acquisition of English, so some people say writing can best reflect an individual’s education.

EFL writing practice has two goals: language acquisition and writing skill practice. The first goal focused on linguistic accuracy, discourse pattern, and made students write from sentence to paragraph to essay. This way, students were equipped to write with a clear and rigid format: an introduction with thesis statement, supporting paragraphs, a concluding paragraph, sometimes some rhetorical devices like compare-and-contrast or cause-and-effect were used. The latter goal focused on writing process, express meaning and content (Budiharso, 2006; Yiu, 2012; Solikhah, 2017).

Majority of students produced low quality essays because they were not serious or critical enough when producing drafts or revising. The prominent problems related to writing attitude and habits. When composing, some students did not use certain strategies like to think critically about writing process, plan and develop contents, edit or even revise writing outputs (Ismail, et.al., 2010). They simply wrote without much concern to their writing steps or process, e.g. outline and brief draft.

Regarding translation process in writing, students used more bilingual dictionary than monolingual because bilingual dictionaries may lead to errors. In writing process, students consulted on both the dictionaries. To overcome this problem, students are advised to use both bilingual and monolingual dictionaries.

The final finding drawn in the present study was that most students finished writing process without proofreading. The students were not aware the function of proofreading to qualify an essay. Proofreading means examining the essay carefully for errors in grammar, spelling, punctuation and style. Proofreading can make writing more professional and clearer.

Conclusion:-

This study provides insights that writing characteristics EFL learners to write an essay are about identical. In the process writing, drafting, revising and strategies to write an essay in this study showed similarities with other studies. Lower students were absence of some aspects in the drafting and revising process. Lower group did not write outline and produced first draft without planning. Thesis statement, topic sentence and concluding paragraph did not appear. The middle group was able to produce thesis statement, body paragraphs and conclusion, but they focused less on revising and proofreading. The higher group exhibited by performing all aspects of an essay in each rhetorical patterns. Drafting and revising were used appropriately. Overall, all groups asserted literal translation to develop ideas and overcome problems on diction.

Abstract

Model Predictive Controller (MPC) is described in this paper for the improvement of power quality in Microgrids. Microgrid is a low voltage grid which is subjected to disturbances. The distributed energy resources are connected to the LV bus by means of power electronic converters. The power quality issues are analyzed with MPC control algorithm in both- Grid connected & Islanded modes. But the Islanded mode is analyzed separately. Predictive control based Distribution static compensator (DSTATCOM) injects voltages at the point of common coupling (PCC) in the Microgrid. Reactive power compensation is done with two linear & one non linear load in both modes of operation. The principles and the proposed algorithm are verified by MATLAB/SIMULINK simulation. Simulation results suggest that this control method can decrease the power quality issues and increase the microgrid stability.

Introduction:-

In traditional power systems, a few large centralized power generation plants produce most of the power and emissions. The generated electric power is then transferred towards large load centers over long distance transmission lines. The system control centers monitor and controls the system continuously to ensure the quality of the power, namely the frequency and the voltage. However, due to the rapid increase in global energy consumption and the diminishing fossil fuels, the demand for new generation capacities and efficient energy production, delivery and utilization is rising. Utilizing renewable energy [1], distributed generation, and energy storage in large scale can potentially solve such problems as energy shortage and global climate change.

A promising structure to interconnect these distributed Energy resources are the microgrid paradigm. A microgrid is a low-voltage distribution system which is subjected to lot of disturbances when non linear loads such as electric arc furnaces, electric arc welders, adjustable speed drives and switch mode power supplies are connected [3]. These loads may generate harmonics and increase the demand of reactive power flow from the renewable energy resources. Microgrids have to be operated isolated from the main grid in case of faults, which are controlled by the Microgrid central controller. The elimination of these power quality issues in the connection with the distributed energy resources can be done by the usage of Series active filters or the Custom power devices (CPD) like DSTACOM, Dynamic voltage restorer(DVR) and Unified power conditioner(UPQC).

Traditionally, inverters used in Microgrids behave as current sources when they are connected to the grid, and as voltage sources when they work autonomously [2]. Currently, most inverters in Microgrids adopt the voltage-source inverter (VSI) topology with a current controller to regulate the current injected into the grid. Current-controlled inverters have the advantages of the high-accuracy control of an instantaneous current, peak-current protection, overload rejection, and very good dynamics. The performance of the VSI depends on the quality of the applied current-control strategy and, in order to meet power quality requirements, inverters in Microgrids should have very good capability in harmonic rejection.

There has been considerable research in the field of power quality issues. The various techniques used in the control of custom power devices for the solution to the active & reactive power compensations are Instantaneous reactive power theory, Model Predictive control, Modified power balance theory, Enhanced PLL technique, Artificial Neural network.[5].

Predictive control technique has been chosen for the mitigation of issues in the distributed energy resources based microgrid. Three distributed energy resources are being modeled and the DSTATCOM with MPC controller has been injected into the point of common coupling to compensate the active & reactive power. MPC is an advanced method of process control that allows the time slot to be optimized keeping the future timeslots into account. It has the advantage to anticipate the future events and take control actions accordingly. MPC predicts the change in dependent variables of the modeled system that will be caused by changes in independent variables e.g. reactive power and Harmonics.

2. EXISTING METHODS

This section describes the methods that were already implemented in the mitigation of power quality issues in the distribution systems. Different strategies like proportional–integral (PI), proportional–resonant (PR), predictive deadbeat (DB), or hysteresis controllers have been proposed in the control of active and reactive power compensation. The PI control scheme in the synchronously rotating (d, q) reference frame is commonly used and can work well with balanced systems, but it cannot cope with unbalanced disturbance currents, which are common in Microgrids. The PR control scheme in the stationary (α, β) reference frame is popular due to the capability of eliminating the steady-state error, while regulating sinusoidal signals, and the possible extension to compensate multiple harmonics. However, the resonant frequency in the controller has to be identical to the varying grid frequency in order to maintain good performance. Hysteresis control is simple and brings fast responses, but it results in high and variable sampling frequencies, which leads to high current ripples, poor current quality, and difficulties in the output filter design. In order to obtain a fixed switching frequency, the complexity of the controller will be increased, if an adaptive band hysteresis controller is used.

Compensation and control strategies to eliminate the influence of non-linear and unbalanced loads on Microgrid and the utility grid that connected based on instantaneous power in d-q reference frame has been proposed [3]. In the paper a reference current is generated for the distributed sources (DS) with the difference between the rated power of DS and the power demand of the local non-ideal loads. The power sharing of the DS are not considered in this paper. Compensation algorithm proposed in this paper was based on instantaneous power theory in abc reference frame. It takes no consideration about the unbalanced loads at PCC which are long distances from any DS in the Microgrid. There were no related studies in the field of Microgrid power quality improvement using this approach. Another paper proposes an algorithm and control, based on instantaneous power in d-q reference frame by considering the non-linear and unbalanced loads in the Microgrid [5]. The reference currents converters are generated with respect to the difference between the instantaneous currents at the distribution network and the load sides. Inverse droop control was proposed to achieve the switching of the operating modes. The paper does not tell anything related to fault analysis mode of Microgrid with the existing method.

The work described in another paper regards the evaluation through numerical simulation, of the inverter-fed MG dynamic behavior under islanded operation for different load conditions and using two different control strategies [11]. Control scheme based on droop concepts to operate inverters feeding a standalone ac system is presented. Two kinds of controlling was used to operate an inverter. PQ inverter control and voltage source inverter control (VSI). In the latter control, inverter was controlled to feed the load with pre-defined values for voltage and frequency. This paper describes and evaluates the feasibility of the control strategies needed for Microgrid (MG) islanded operation, where no directly grid-connected synchronous generators are used.

A control algorithm based on correlation function approach in DSTATCOM was done in another paper [5]. In this approach, an extraction of fundamental active and reactive power components of load currents is based on correlation and cross correlation functions in time domain. For estimation of fundamental active and reactive power components of load currents, a numerical integration is applied in correlation and cross correlation function. The improvement of the transient response of parallel connected inverters without using the communication signals were proposed in ac distribution system [6]. A wireless controller was developed, by adding supplemental transient droop characteristics to the conventional static droop approach, which improves the paralleled-system dynamics. Several intrinsic problems led to its limited transient response, as the system dynamics depends on the power calculation characteristics. Another new adaptive neuro-fuzzy control method is utilized to achieve smooth bidirectional power flow and nonlinear unbalanced load compensation simultaneously [8]. In this case, the traditional PI controller might be insufficient because of the instantaneous changes in the dynamics of the system. An integrated diagnostic system was developed for islanding detection using a neuro-fuzzy model for grid-tied inverter-based DGs. In a paper, an adaptive neuro-fuzzy inference system was used for islanding detection.

In reference[8], a current control method for inverters based on the sigma delta modulation algorithm called the sigma delta-based current controlled voltage source inverter interfaced with DG generators was studied. A particle swarm optimization method was used for the optimum tuning of the controllers as a result of the existent number of PI controllers. $\Sigma\Delta_CC_VSI$ minimizes the harmonics of the unfiltered voltage. Thus, it is powerful in minimizing electromagnetic interference, which is critical for sensitive loads. The development of new control strategies and execution of multifunctional compensation capability are the main research trends related to both active power flow control and mitigation of various PQ disturbances using MFIs.

A previous study analyses the limitations of the standard resonant current control operating under abnormal grid conditions and then introduces a control scheme that improves the current harmonic distortion in such adverse conditions without increasing the computational load of the standard current control[12]. The resonant current control has been extensively employed to reduce the current harmonic distortion in a wide range of DG applications. This control uses a proportional-resonant (PRES) compensator to track the fundamental component of the current reference signal and a resonant harmonic (RESH) compensator to attenuate the most important current harmonics. The main problem of the resonant current control is the performance deterioration given by abnormal conditions in the utility grid. Power quality improvement in micro grids by using Active power conditioner was proposed in another literature [13]. The Active Power Conditioner (APC) acts as an interface between renewable energy sources and the AC bus of a micro grid and uses an APC control strategy, which makes it possible to inject energy in the micro grid, compensate the current harmonics and correct the power factor. Proposed control algorithm is compensation method that makes the APC compensate the current of a non-linear load by forcing the Microgrid side current to become sinusoidal and balanced. Compared with linear controllers, the non-linear ones based on hysteresis strategies allow faster dynamic response and better robustness with respect to the variation of the non-linear load. A drawback of the hysteresis strategies is the switching frequency which is not constant and can generate a large side harmonics band around the switching frequency. To avoid this drawback, the switching frequency can be fixed using different solutions like variable hysteresis bandwidth or module bandwidth.

Proposed Method:-

In this section a model of a typical Microgrid is explained that was used to carry out the analysis of the power quality issues. A typical Microgrid is shown in Figure 3.1.

Fig.3.1:- Proposed Microgrid.

In the proposed Microgrid diagram, three distributed energy resources blocks like Solar Energy, Wind Energy and Microturbine are modeled in both Grid connected and Isolated modes of operation. It is then connected to two linear and non-linear loads via a static switch. Linear loads like Incandescent lamps, Heaters etc and the Non-linear loads are SMPS, refrigerators, Television etc. The static switch is closed in grid connected and opened in islanded mode. The compensation of reactive power and harmonics is done by Model Predictive controller (MPC). Each Distributed resources are modeled with the Predictive algorithm separately and added to the point of common coupling.

Model Predictive controller (MPC) concept is most widely used in all modern control techniques. The MPC formulation is based on giving a reasonably accurate model for current system, possible consequences of the current and future manipulated input moves on the future plant behavior and the constraints can be forecasted online and used while deciding the input moves in an optimal manner. MPC has four important tuning parameters which controls the formulation of algorithm. They are weight matrix, the output weight matrix the prediction horizon and the control horizon. Only the first step of the control strategy is implemented, then the model state is sampled again and new calculations are repeated starting from the new current state, yielding new control & predicted path. MPC starts adjusting the control signal head of the reference changes. This model works in two modes of operation

Grid connected mode: In this mode, Microgrid is connected to the Main grid through a static switch. The references for the DS controller can be obtained from the Grid. The reactive power is compensated with the help of the Predictive control algorithm. The Diagram in the Grid connected mode is shown in figure 3.2.

Fig.3.2:- Grid connected mode

Islanded Mode: Islanding of the Microgrid can take place by unplanned events like faults in the grid side or by planned actions like maintenance requirements. In this mode also three DGs are modeled using MPC controller and connected to the PCC. The main grid is disconnected from the Microgrid by using the static switch. In this case, the local generation profile of the microgrid can be modified in order to reduce the imbalance between local load and

generation. The Microgrid has to work autonomously feeding the loads. MPC generates references for the function of the Microgrid. After 0.2s the Grid is added to the Microgrid. The diagram of the isolated mode is shown in the figure 3.3.

Fig.3.3:- Isolated mode

In the isolated mode of operation due to the presence of non-linear loads all the DG's have to compensate the loads, in the absence of the Grid. The present network has a dominant impact in the quality of power delivered to the loads in the case of Isolated mode while considering the non-linear load. For the improvement of reliability of the present system, a modification in the Microgrid is proposed. DSTATCOM was proposed to be added to the existing system. The need for the CPD in the distribution side of the Microgrid was for the smooth function whose performance was very sensitive to the quality of power delivered to the loads. The result of the nonlinear loads in the distribution side makes the waveform of suppliers to be in the distorted form.

A DSTATCOM is a custom power device which is utilized to eliminate the harmonics from the source currents and also balance them in addition to providing reactive power compensation to improve the power factor or regulate the load bus voltage. With the shunt connected controllers (DSTATCOM), it is possible to control the power flow in critical lines. DSTATCOM was also modeled with the Predictive controller to regulate the power flow at the point of common coupling. This system was checked with the two modes of operation and in addition to that fault analysis mode too. The effectiveness of the proposed system was verified using the MATLAB/SIMULINK program.

The Predictive controller is been incorporated in each distributed sources and the DSTATCOM which injects voltages and currents to the point of common coupling in both the modes. MPC controller is shown in figure 3.4.

Fig.3.4:- Model Predictive Controller

The reference currents are produced by the MPC by the help of three reference signal constants converted to alpha-beta version and is given to the Predictive control block from the Simulink tool box. Actual currents are also sensed and given to the controller block. Controlled output signals will be fed to the PCC from each modeled Distributed resources. Modeled Solar with MPC is shown in the Figure 3.5.

Fig.3.5:- Solar Model with MPC

It consists of a PV array which is fed to six bridge inverter and given the output to the PCC. The pulses to the thyristors are given from the MPC controller.

Results & Discussions:-

The Simulink diagram of the proposed Predictive control based DSTACOM is shown in the figure 4.1.

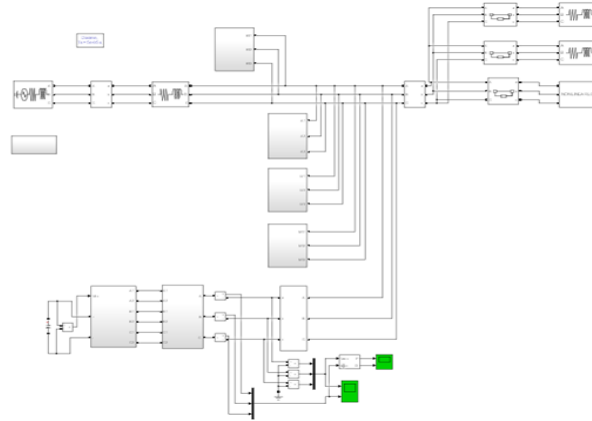

Fig.4.1:- Grid connected mode with DSTATCOM

The test model contains three Distributed energy resources which are modeled with the Predictive controller and the power ratings of the solar and wind models with a varying output of 5kW and reactive power of 10kW varying with respect to time. Three loads are connected to the PCC with two light loads of 25 kW each and a non linear load of 18 kW with 8.5KVAR and 12.3 KVAR respectively. The grid rating is 2500×10^6 VA and 60 Hz frequency.

The test micro grid was simulated in two different modes of operation.

Grid Connected mode:-

The simulation sequence was as follows. Load1 was decreased from 25 kW and 18 kW to 20kW and 10 kW at 1.2 s to investigate power sharing in terms of load variation during grid-connected operation. At 2.0 s, the static switch was opened so that the Microgrid was islanded from the grid. Output Active & Reactive power at the Grid and load side is shown in the simulation graphs from the figure 4.2& 4.3.

Fig 4.2:- Grid Side Active & Reactive power

Fig .4.3:- Load side Active & Reactive power

From the above shown graphs, when all the loads are connected to the grid the active power becomes 95kW and reactive power becomes 190 kvar with a small spike.

Islanded Mode:

The static switch was opened and the grid will be disconnected from the AC bus. Load is being varied to appropriate values. The IGBT inverters which are modeled in each Distributed sources with the MPC will operate in Islanded mode. If there is any decrease in the DG output to load, the controller compensates the DS output. Figure 4.4 shows the Microgrid operation in Isolated mode of operation.

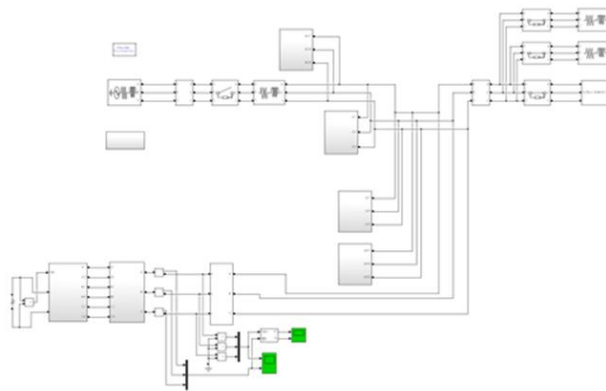

Fig.4.4:- Islanded Mode with DSTATCOM

In the islanded mode of operation, when all the **loads** are connected to Microgrid, load power is compensated by the MPC based DSTATCOM at the PCC. From the figure 4.5..a. It's clear that the DSTATCOM compensates the active and reactive power in the Islanded mode up to 0.2s of the Microgrid and loads. Its negative value is of 2.5×10^4 VAR of reactive and 500 W of active power. Figure 4.5 shows the load side Active and reactive power in the Isolated mode of operation.

Fig.4.5.a:- DSTATCOM output in Islanded Mode

Voltage variations were seen in this mode of operation when non-linear load is connected. This is shown in the figure 4.5.b.

Fig.4.5.b:- load side active and reactive power

Due to the presence of second order harmonics with Non-linear load in the isolated mode of operation all the DG's are connected to a single modelled structure as shown in Figure 4.6 to improve the system stability when the Grid is disconnected.

Fig.4.6:- Incorporated view of DG's

All the modelled DG's are connected to a single MPC controller and it has been connected to the point of common coupling (PCC) with the DSTATCOM. The output of the current view is shown in the figure 4.7. It is clear that Reactive power is being compensated in the islanded mode of operation completely. Negative reactive power is caused by capacitive loads that include lighting ballasts, variable speed drives for motors, computer equipment, and inverters.

Fig.4.7:- Load active and Reactive power.

Conclusion:-

In this paper an MPC based DSTATCOM was implemented in the Microgrid. The Microgrid reliability and the compensation of the reactive power were examined with the simulation results. Predictive controller was successfully implemented in the Distributed resources and the power quality issues were studied, analyzed and compensated in the proposed Microgrid. The control algorithm was implemented in the conventional distribution system; it is also applicable in the case of Microgrids too. MPC based DSTATCOM was incorporated in the Microgrid and comparative results were done in both Grid connected and Islanded modes with the help of Simulation. In

Grid-connected mode, DGs compensates the non-linear and unbalanced loads and shares with utility grid in a pre specified ratio. During islanded mode harmonics were present on the system with non-linear load, on basis of the future analysis advantage characteristics and the variations of voltage and frequency, an incorporated view is being suggested and the satisfactory results were produced. Battery source was also added to the Microgrid to compensate the loads in the islanded mode. MPC offers a good improvement from the conventional PI and PR controllers in the presence of linear and non linear loads. A future development is to check the MPC controllers with the fault analysis mode in the proposed Microgrid.

APPENDIX

DC VOLTAGE	400V
SWITCH FREQUENCY	16Hz
GRID VOLTAGE	400kV, 2500MVA
VOLTAGE IN ISLAND	390kV, 60Hz
LIGHT LOAD1	25kW ,8.5kVAr
LIGHT LOAD2	25kW, 10kVAr
NONLINEAR LOAD	18kW , 12.3kVAr
X/R RATIO	10
V_{dc}	350 V (Vary)

Key words:-

Arsenic (As), tomato puree, ovary and follicle.

Abstract

Arsenic compound are known to induce toxicity in mammalian system. However reproductive toxicity is comparatively less expedited. Arsenic has a long environmental persistence and never loses its toxic potential. Arsenic affects the reproductive systems of female Swiss mice. In the present study, toxic effects of arsenic are observed on histopathology of ovary studied after administration of low (1mg/kg body weight) dose of arsenic trioxide to the Swiss albino mice; along with this tomato puree on arsenic induced toxicity has also been examined. A significant weight loss of ovary was also observed. Moreover, arsenic was also responsible for ovarian follicular degeneration and vacuolization in follicular cells. The results of the present study indicated a marked effect of recovery of the follicle cells of the ovary after exposure to tomato puree with higher dose as it was dose dependent.

Introduction:-

Arsenic in drinking water is one of the top most environmental threats worldwide as it is associated with numerous diseases (Tapio and Groshe, 2006). Environmentally relevant forms of arsenic are inorganic and organic existing in the trivalent or pentavalent state (ASTDR 2007b). Presently, due to enhanced human activities like mining, smelting, coal combustion, etc., the level of arsenic has crossed its permissible limit (Sharma and Singh, 2016) and Chronic intake of arsenic is strongly associated with an increased risk of skin, lung, liver and other cancers, type 2 diabetes, cardiovascular diseases, neurological, cognitive defects, reproductive and developmental problems (Kargas *et al.*, 2002; Prozialerk *et al.*, 2008; Walker *et al.* 2009). But recently arsenic intoxication in experimental animals has been associated with hepatic tumors (Waalkes *et al.*, 2003), inhibition of testicular steroidogenic function (Sarkar *et al.*, 1991) and spermatogenesis (Sukla and Pandey, 1984) as well as with severe metabolic disorders such as diabetes in humans (Longnecker and Daniels, 2001; Tseng *et al.*, 2002). Long term exposure of arsenic is associated with abortion, low birth weight and reduced lactation (Donald *et al.*, 1995) as well as with embryonic cells toxicity in vitro (Lee *et al.*, 1985). Though, there is scanty literature on the effect of arsenic on ovarian steroidogenic functions, particularly at the dose levels occurring in drinking water in wide areas of India and in other countries where this trace element is present in the range above the admissible limit of 0.01 ppm, (Rahman *et al.*, 2003). Chattopadhyay *et al.*, (1999) considered arsenic to be responsible for the inhibition of ovarian steroidogenesis and as an elevator of adrenocortical steroidogenesis (Ghosh *et al.*, 1999) even when the level of arsenic was within the range in drinking water of West Bengal.

Chemotherapeutic drugs are effective against cancer cells because they are designed to interfere with rapidly dividing cells. Many chemotherapeutic agents induce the production of free radicals. These free radicals can be bound and detoxified by antioxidant compounds such as lycopene (Sahin, *et al.*, 2010). Lycopene accumulates in relatively few tissues and is found in ripe tomato fruit, watermelon and pink grapefruit giving them a characteristic red pigmentation. Tomatoes and processed tomato products such as juice, ketchup, paste, sauce and soup all are good sources of lycopene and may account for over 85% of dietary lycopene in the North American diet. Lycopene is considered as cardioprotective and anticarcinogenic (Chen *et al.*, 2007). The lycopene content of tomatoes varies with the variety and increases with fruit ripening. Several studies (Bohm *et al.*, 1995; Lu *et al.*, 1995; Dimascio *et al.*, 1989) have indicated that lycopene is an effective antioxidant and free radical scavenger. The present work is aimed to evaluate the protective role of tomato puree on arsenic induced toxicity in ovaries of albino mice.

Materials And Methods:-

Animal selection and care:-

Female Swiss albino mice having weight 20-30g were procured from CENTRAL RESEARCH INSTITUTE, KASALI and DISTRICT SOLAN (H.P.). The present research work has been carried out with the permission of Institutional Ethical Committee (107/99/CPCSEA/2013-02).

They were kept and acclimatized to laboratory conditions for 2 weeks under optimal condition of light and temperature. The animals were given standard mice feed and *ad libitum* access to R.O water. The animals were handled with humane care in accordance with National Institute of Health guidelines.

Chemicals: - The Arsenic trioxide was obtained from QUALIKEMS FINE CHEMICAL PVT. LTD., NEW DELHI. Its stock solution was prepared by dissolving 1.32g of As₂O₃ and 4g of NaOH in one litre of distilled water (1ml of stock solution contained 1mg of As) and was administered intraperitoneally to mice. Tomato puree marketed by KISSAN HINDUSTAN UNILEVER PVT. LTD. MUMBAI was used as a source of lycopene. It contained 36.8% tomato paste.

Experimental design: - Mice were divided into following groups:

Group I- Control animals were given equal volume of distilled water only.

Group II- Albino mice were administered arsenic trioxide at a dose of 1mg/kg body weight (b.wt.) intraperitoneally (i.p).

Group III- Mice were injected an acute dose of 1mg/kg b.wt. of arsenic trioxide i.p. followed by a daily dose of 20mg/kg b.wt. of lycopene for 15 days.

Group IV- Mice were injected an acute dose of 1mg/kg b.wt. of arsenic trioxide i.p. followed by a daily dose of 40mg/kg b.wt. of lycopene for 15 days.

Autopsies from each group were done on 15 days post treatment. Ovaries were removed, freed of adipose tissue, blotted dry so as to remove blood and were weighed separately.

Histopathological studies:-

The ovaries were fixed in alcoholic Bouin's fixative and embedded in paraffin wax (58-60°C) and the sections were cut at 5-7µ thick sections were stained with Heamatoxylin-eosin stains.

Statistical analysis: - Data were subjected to Student's *t*- test is used to compare the control group vs. treated (arsenic) group and antioxidant treated groups.

Results And Discussion:-

Heavy metals toxicity is a worldwide problem which adversely affects the growth, health, reproductive performance and life span of living organisms (Dhir, 2011). The present study showed a histopathological alterations in ovary of arsenic treated mice were in the form of ovarian follicular degeneration, vacuolization in granulosa cells, loss of uniformity in granulosa cell layer. Chattopadhyay *et al.*, (2003) suggested that As influences hypothalamic pituitary ovarian axis which leads to deficiency in secretion of growth hormone and hence reduction in body weight. Similarly Chattopadhyay *et al.*, (2003) observed ovarian follicular and uterine cell degeneration which was also accompanied by decrease in dopamine levels in the midbrain and diencephalon as well as increased arsenic levels in ovaries, uterus and plasma. Low dopamine levels could decrease gonadotrophin synthesis and secretion. Thus, it attributes to decrease in the number of healthy follicles and increase in the number of apoptotic follicles. The authors suggested that uterine cells degeneration may be due to low ovarian estradiol after arsenic treatment.

Histological changes in Ovary:-

The histopathological alterations observed in ovary of arsenic treated mice were in the form of ovarian follicular degeneration, vacuolization in granulosa cells, loss of uniformity in granulosa cell layer loose germinal layer, hyperaemia in medulla and vacuolization in germinal epithelium cells, (Fig.2,6,8) and degenerative changes in the oocyte and reduction in the secondary and graafian oocytes along with an increase in the number of atretic oocytes. These findings are supported by the results of Chadhopadhyay *et al.*, (2003); Islam *et al.*, (2011) and Dezfouli *et al.*, (2014).

Moreover, it is shown that As is responsible for vacuolization, atrophy and hyperaemia in the medulla along with the decrease in the number of follicles (Jhala *et al.*, 2004; Dezfouli *et al.*, 2014).

Estrogen plays a critical role in regulating the sex organs as well as sex gonadal development. This implies a direct impact on the growth of ovary cells, particular folliculogenesis. Furthermore, estrogen elevates the effects of FSH on granulosa cells (Hegele-Hartung *et al.*, 2003) and in this way performs an important role in follicular development. Arsenic reduces the level of estrogen and as an endocrine disruptor can cause ovarian follicular degeneration (Dezfouli *et al.*, 2014).

In the present study, the ovary of TP (20mg) treated mice showed normal histology as compared to arsenic treated mice (Fig 3.). Fig.9 depicted moderate signs of protection as primary follicles showed vacuolization in granulosa cells the number of primary follicles was observed to be more as compared to arsenic treated mice. Group IV As depicted mice co-administration with 40mg/kg b.wt. of TP showed a great protection to the ovary against arsenic toxicity. The graafian follicles as well as germinal epithelial layer retained their original shape, structure and thecal layers were also properly discernible (Fig. 4,10).

The existence of LH (Luteinizing hormone) receptor sites in granulosa cell membrane is induced by FSH (Follicle stimulating hormone) that prepares the graafian follicles for a preovulatory LH surge. Furthermore, induction of LH receptors by FSH is necessary for interactions between granulosa cells, which is important in cell differentiation. It is also believed that estrogen enhances the effects of FSH on gene expression in granulosa cells (Erickson *et al.*, 1979). As granulosa cells play important role in development and maturation of oocytes, the dysfunction of granulosa cells may lead to disorder of folliculogenesis and steroidogenesis (Lan *et al.*, 2013). It has been demonstrated that LH stimulates follicular maturation and induces follicular atresia. Sharma *et al.*, (2012) recently suggested that LH is also a stimulant for early stages of follicular growth. Heavy metals not only exerted inhibitory effect on follicular growth but also stimulated the atretic follicle formation (Tajima *et al.*, 2007; Mori *et al.*, 2009).

Conclusion:-

There are many evidences supporting the antitoxic and anticancer action of tomato puree. The results of the present study demonstrates that arsenic induced histomorphological and oxidative stress is responsible for promoting deleterious effects of arsenic in the ovaries, but tomato supplementation (tomato puree) which is considered as one of the most potent antioxidants among dietary carotenoids showed very promising and encouraging ameliorative effects on arsenic induced oxidative stress in female reproductive organs of swiss albino mice.

Key words:-

Brand Image, Service Quality,
 Marketing Communication.

Abstract

The research aimed to examine and analyze either partial or simultaneous influence of brand image, service quality and marketing communication on purchase decision of Mal Artha Gading consumers. Of 40.000 populations, 100 samples were obtained, based on Slovin's sampling technique. For data collection, the research relied on questionnaires and interviews. Descriptive and inferential statistics were applied for data analysis. The research findings have revealed that brand image, service quality and marketing communication influence consumer purchase decision simultaneously. Partially, brand image variable gave the greatest and the most significant influence on consumer purchase decision, while service quality did not influence consumer purchase decision very much; marketing communication had a significant impact on consumer purchase decision. The implication is that in order to have consumers make a purchase, the management had better improve its brand image, service quality and marketing communication.

Introduction:-

Shopping malls in Indonesia have evolved so fast. Starting from Sarinah which is the first mall in Indonesia with about 5,000 m² width of retail area in 1962 nowadays Jakarta becomes a city with the greatest number of malls and shopping centres in the world. It has 173 shopping centres spreading in 5 areas of its, with 4,232,100 m² retail area used.

The condition is experienced by Mal Artha Gading, one of malls and shopping centres in Kelapa Gading which has wider total net leaseable area than other shopping centres in Jakarta have. It is 373,228 m² width in which the shopping centres built have different concept but same catchment area.

Mal Artha Gading is located in Kelapa Gading, precisely beside Cawang – Tanjung Priok toll road. Since it was opened to the public on 27 October 2004, the mall has greatly competed with other malls such as Mal of Indonesia (MOI) built in the first year of Mal Artha Gading operation, Bay Walk Pluit, Kota Kasablanka, Gandaria City and Mal St.Moris Puri which are more modern. The competition continues until the building Mal Kelapa Gading 3.5 and Gading Walk. This makes Mal Artha Gading keep competing with other malls and shopping centres.

Address:- Chief of magister management program University of Muhammadiyah Prof. Dr. Hamka, & Commissaries of PD Pasar Jaya.

A success measurement of a shopping center is the increasing number of its visitors indicated by the achievement of total visitor numbers targeted by its management. It is experienced by Mal Artha Gading with 38,000 visitors per day, below its target which is 40,000 to 43,000 visitors per day. Table 1 shows data of unachieved daily visitor target of Mal Artha Gading

Table 1:- Average Number of Daily Visitor of Mal Artha Gading from January to May 2015

Visits	Daily	Weekday	Weekend	Total	Target	Dev
Customer	38,000	30,000	53,000	1,150,000	1,250,000	-8%
Cars	8,000	7,000	11,000	240,000	262,500	-9%
Motorcycle	2,500	2,700	3,000	78,000	87,500	-11%

Source : BP. MAG 2015

In 2012 – 2015 the number of visitors decreased; the management tried to find the cause, whether it is internal factors or external factors. In the last three years, the number of its visitors is presented in Table 1.3.

Table 1.3:- Average Number of Monthly Visitor from 2013 to 2014

Years	Average Number of Monthly Visitor	Target	Deviation (%)
2012	1,048,800	1,100,000	-5%
2013	1,037,875	1,150,000	-10%
2014	1,092,500	1,200,000	-9%

Source : BP. MAG 2015

Based on the initial survey conducted in Central Jakarta, South Jakarta, West Jakarta, and East Jakarta, Mal Artha Gading was found less popular than the same level Mal in the same area. Therefore, brand image and marketing communication strategy have important roles. In addition, service quality also takes part in making consumers visit the mall.

In accordance with the introduction above, three identified problems are: 1) unachieved visitor target; 2) unpopularity of Mal Artha Gading; 3) image of Mal Arta Gading identical with a second class mall resulting in low interest of visitors; 4) poor service quality.

In addition to the phenomena which have been explained, this research was supported by the findings stated in international journals involving: 1) Ong and Sugiharto (2012) , Evelina, Handoyo, and Listyorini (2012), and Nurlisa and Sofiyah (2010), suggesting that brand image, service quality and promotion positively and significantly influence purchase decision; 2) Kusumah Ridwan (2011) and Tristania Widiyanti (2008) revealing that service quality has significant impact on purchase decision; 3) Zikmund, William G. (2003), in Hapzi Ali (2012), finding that service quality positively and significantly influence brand image.

Based on the problems, this research aims to analyze the influence of:

- 1) Brand image on purchase decision;
- 2) Service quality on purchase decision;
- 3) Marketing Communication on purchase decision, and
- 4) Brand image, service quality, and marketing communication simultaneously on purchase decision

Literature Review:-

Brand Image:-

Ditcher (1985) defines image as an illustration that in detail explains of the entire entity impression of object owned by society. Kotler and Armstrong (2001:225) state that brand image refers to a set of consumer believe in a certain brand. Brand image can be defined as a perception about brand as reflected by the brand association held in consumer memory (Keller, 1998:93).

In this research the context of image measured is the image of a shopping centre. A study on image of a shopping centre reveals that communication and consumers' shopping experience in a shopping centre and consuming goods or service experience influence their purchase interest. Communication among consumers known as word-of-mouth

communication, promotion and communication in media influence customer perception (Zeithmal and Bitner, 1996).

In according to the theories, this research analyzed brand image variable using theory proposed by Chang and Tu (2005) that is considered to be relevant for studying a shopping centre with four available dimensions which are facility, service, activity, and convenience.

Service Quality:-

Quality is a dynamic condition that has impacts on products, service, human being, process, and environment that meets or exceeds the expectations (Tjiptono, 2001). Thus service quality can be defined as an effort to meet the need and desire of consumer and its delivery directness in balancing the consumer expectation (Tjiptono, 2001).

Parasuraman, et.al (1998) concludes that there are five dimensions of service quality, which are: 1. tangibles, 2. reliability, 3. assurance, and 4. Empathy. According to Kotler and Keller (2008:156), there are some dimensions of quality in the context service quality which can be used as reference; they include responsiveness, reliability, empathy dan assurance serta tangibility.

Based on the theories, this research analyzed service quality variable using theory by Parasuraman (2001) that is considered to be relevant for studying a shopping centre with five available dimensions which are tangibility, reliability, responsiveness, assurance, and empathy.

Marketing Communication:-

Mahmud Machfoedz (2010:16) states that marketing communication refers to all elements of marketing that have value and communicate the value to consumer and stakeholder of a company. Kotler and Kevin Lane Keller (2007:204) suggest that marketing communication is a mean used by a company to inform, persuade, and remind consumer either directly or indirectly about products and brands that they sell.

Furthermore, Prisgunanto (2006:8) state that marketing communication refer to all promotion elements of marketing-mix involving any form of communication between organization and its target audience for marketing performance. In accordance, it is concluded that marketing communication is an effort of a company to send its message about the existence of its products in market to the consumer and stakeholder

Based on the theories, this research analyzed marketing communication variable using theory by Prisgunanto (2006) that is considered to be relevant for studying a shopping centre with eight available dimensions which are direct marketing, sales promotion, marketing public relation, personal selling, advertising, publicity, event/sponsorship, and interactive marketing.

Purchase Decision:-

Phillip Kotler (2005:204) suggests five stages of purchase decision process, which are need recognition, information search, alternative evaluation, purchase decision, and post purchase behavior. This model emphasizes that process starts before the purchase and has further impacts after the purchase.

Kotler (2006:129) mentions five types of decision which customers make, which are product options, brands, distributor choices, time of purchase, and number of purchase. Consumers can take purchase decision on the number of purchase to make in a time. In addition, Kotler (2012:166) states that purchase decision is a process consisting of five stages passed by a consumer before making decision to purchase and after making a purchase.

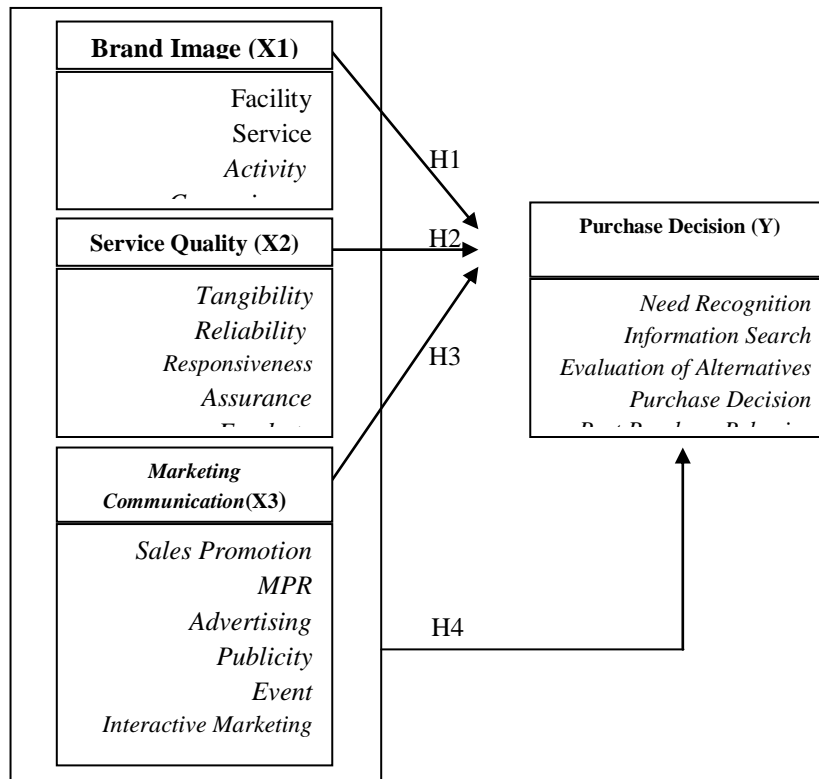

Based on the theories, this research analyzed purchase decision variable using a theory by Philip Kotler (2005) that is considered to be relevant for studying a shopping centre with five available dimensions, which are need recognition, information search, alternative evaluation, purchase decision, and post purchase behavior.

Conceptual Framework:-

Conceptual framework has a function to design the influence or relationship between variables, that brand image, service quality, and marketing communication positively and significantly influence consumer purchase decision either partially or simultaneously.

The conceptual framework of this research was formulated based on background of the study, some proposed theories, and some previous researches involving: 1) Ong and Sugiharto (2012), Evelina, Handoyo, and Listyorini (2012), and Nurlisa and Sofiyah (2010), suggesting that brand image, service quality and promotion positively and significantly influence purchase decision; 2) Kusumah Ridwan (2011) and Tristania Widiati (2008) revealing that service quality has significant impact on purchase decision; 3) Zikmund, William G. (2003), in Hapzi Ali (2012), finding that service quality positively and significantly influence brand image. The conceptual framework of the research is illustrated in Figure 1.

Figure 1:- Conceptual Framework

Based on the conceptual framework, the hypotheses of this research are:

1. Brand image positively influences the consumer purchase decision.
2. Service quality positively influences the consumer purchase decision.
3. Marketing communication positively influences the consumer purchase decision.
4. Brand image, service quality, and marketing communications simultaneously positively influence the consumer purchase decision.

Methods:-

This research is a quantitative research which analyzes numerical data and processes the data using statistical method (Azwar, 2009a: 5). It employed correlation approach. It examined the correlation of brand image, service quality, and marketing communication and number of Mal Artha gading visitors. Arikunto (2010: 4) explains that correlational research aims to find the relationship between two or more variables without either changing or manipulating the available data.

Survey method was applied in this research. Of 40.000 populations, 100 samples were obtained, based on Slovin's sampling technique (Husein Umar, 2003:120). The populations of this research were visitors who did shopping in Mal Artha Gading. They were assumed to be loyal customer indicated by their visit frequency, at least once a week, and by their age, age of 18-24 years old that tends to try new things (Wood, 2004, in Setyaningrum, 2007: 110)

Quantitative analysis using regression analysis with SPSS 2.33 was applied. Before analyzing the data, test of questionnaire validity and reliability and test of classical assumption were performed (Solimun, 2008). After Path analysis, the data were analyzed using R^2 Test. T Test and F Test with 5% error tolerance were performed to test the hypotheses.

Result & Discussion:-

Reliability test was done to find and measure if the questionnaires used in the research were relevant and if the reliability of the questionnaires was strong as *composite reliability* > 0.6 . the result is shown in table 4.1.

Table 4.1:- Statistical Reliability of Each Variabel

	Cronbach's Alpha	N of Item
<i>Brand Image</i>	.924	20
<i>Service Quality</i>	.902	20
<i>Marketing Communication</i>	.866	20
<i>Purchase Decision</i>	.831	20

The table shows that all dependent variables and independent variables have cronbach's alpha > 0.6 . It indicates that the variables are reliable and can be used in measurement for data collection.

The following is histogram to investigate that the dependent variable, purchase decision, is normally distributed. One of the requirements to continue to the next stage, regression analysis, is that the dependent variable is normally distributed. The result is shown in Figure 2.

Figure 2:- Histogram

Figure 2 shows that the available data can be used for the next stage that is regression analysis.

Research Findings:-

The Alpha value of the variables of brand image, service quality, marketing communication and purchase decision are 0.924, 0.920, 0.866 and 0.831 respectively. This indicates that reliability of four variables is very strong, which is measured by 20 indicators.

Hypothesis Testing:-

a. Simple Regression Test of brand image on purchase decision

Brand image variable and purchase decision variable have a relationship (coefficients $7.656 > 1.9887$ and $0.000 < 0.05$) and they have a strong relationship (model summary 0.624) and it can be generalized to the population level (ANOVA table 0.000).

b. Simple regression test of service quality on purchase decision

Service quality and purchase decision have a relationship (coefficients $5.897 > 1.9887$ and $0.00 < 0.05$), and they have a strong relationship (model summary 0.514) and it can be generalized to the population level (ANOVA 0.000).

c. Simple regression test of marketing Communication on purchase decision

Service quality and purchase decision have a relationship (coefficients $5.995 > 1.9887$ and $0.00 < 0.05$), and they have a strong relationship (model summary 0.520) and it can be generalized to the population level (ANOVA 0.000).

F test:- Table 4.2. ANOVA

Model	Sum of Square	Df	Mean Square	F	Sig.
1 Regression	2060.479	3	686.826	25.951	.000 ^a
Residual	2514.249	95	26.466		
Total	4574.727	98			

a. Predictors: (Constant), Marcom Score, brand image Score, service quality Score

b. Dependent Variable: purchase decision Score

Table 1 shows that the variables of brand image, quality of service and marketing communication simultaneously affect purchase decision variable.

T test:- Table 4.3. T test

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
1 (Constant)	11.177	4.711		2.373	.020		
Brand image	.390	.093	.513	4.178	.000	.383	2.610
Service quality	.033	.102	-.041	.322	.748	.362	2.760
Marcom Score	.194	.060	.291	3.208	.002	.705	1.418

a. Dependent Variable: purchase decision Score

Table 2 shows that: 1) brand image has a positive and significant impact on purchase decision, 2) Service quality does not affect significantly on purchase decision, and 3) marketing communication has a positive and significant impact on purchase decision.

Multiple Regression Modeling:-

Based on multiple regression modeling, there is a relationship between brand image and marketing communication, and purchase decision and they have a strong relationship (model summary 0.671). This data can explain 45% of purchase decision variance and it can be generalized to the population level (table ANOVA 0.000).

Modeling of Regression Equations:-

- Brand image has a positive effect on purchase decision. If the variable of brand image increases, assuming marketing communication variable is constant, the purchase decision will also increase.
- Marketing communication has a positive effect on purchase decision. If the variable of marketing communication increases, assuming the brand image variables is constant, the purchase decision will also increase.
- The variable of brand image has the most significant effect on purchase decision.

Exploration of Correlation Per Dimension:-

- Brand image, quality of service, marketing communication and problem identification

The variables of brand image, service quality, marketing communication and problem identification do not have a relationship. It can be seen from the table of Significance, which is greater than 0.05.

- Brand image and information search

There is a relationship between brand image and information search (coefficients $2.987 > 1.9887$ and $0.04 < 0.05$), and its relationship is weak (model summary 0.290).

- Service quality and information search

It reveals that there is no relationship between the variable of service quality and information search dimension (coefficients $1.792 < 1.9887$ and $0.76 > 0.05$) and its relationship is weak (model summary 0.290).

- Marketing communication and information search

It reveals that there is a relationship between the variable of marketing communication and information search dimension (coefficients $4.423 > 1.9887$ and $0.00 < 0.05$), and it has a strong relationship (model summary 0.410).

e. Brand image and alternative evaluation

It shows that there is a relationship between brand image and alternative evaluation dimension (table of coefficients $7.683 > 1.9887$ and $0.00 < 0.05$) and it has a strong relationship. (model summary 0.613).

f. Service quality and alternative evaluation

It shows that there is a relationship between service quality and alternative evaluation dimension (coefficients $6.135 > 1.9887$ and $0.00 < 0.05$), and it has a strong relationship (model summary 0.527).

g. Marketing communication and alternative evaluation

It shows that there is a relationship between marketing communication and alternative evaluation (coefficients $5.115 > 1.9887$ and $0.00 < 0.05$), and it has a strong relationship (model summary 0.459).

h. Brand image and purchase execution

It shows that there is a relationship between brand image and purchase execution dimension (coefficients $5.285 > 1.9887$ and $0.00 < 0.05$), and it has a strong relationship (model summary 0.471).

i. Service quality and purchase execution

It shows that there is a relationship between service quality and purchase execution dimension (coefficients $4.277 > 1.9887$ and $0.00 < 0.05$), and it has a weak relationship (model summary 0.397).

j. Marketing communication and purchase execution

It shows that there is a relationship between service quality and execution purchase dimension (coefficients $3.830 > 1.9887$ and $0.00 < 0.05$), and it has a weak relationship (model summary 0.361).

k. Brand image and purchase satisfaction

It shows that there is a relationship between brand image and purchase satisfaction (coefficients $8.187 > 1.9887$ and $0.00 < 0.05$), and it has a strong relationship (model summary 0.637).

l. Quality Service and purchase satisfaction

It shows that there is a relationship between service quality and alternative evaluation dimension (coefficients $5.919 > 1.9887$ and $0.00 < 0.05$), and the strength of relationship is sufficient (model summary 0.513).

m. Marketing Communication and purchase decision

It shows that there is a relationship between the variable of marketing communication and purchase satisfaction dimension (coefficients $4.820 > 1.9887$ and $0.00 < 0.05$), and the strength of relationship is sufficient (model summary 0.438).

Discussions and Research Analysis:-

Visitor perception to the MAG brand image:

Figure 3:- Brand Association of MAG

Based on Figure 3, the perceptions of visitors to the MAG position as a shopping center in North Jakarta are as follows:

- For the top position, MAG is a mall with excellent entertainments (183). It is one of strong points where MAG has an "Amazon" children ride, which is considered as the biggest game zone located on the ground floor, first floor and second floor. Other supporting aspects are the provision of NAV Karaoke, Bowling center with 30 Lines, cinema XXI, and others.

- b. MAG is in the second place as a meeting point (183) since it is located in a very strategic place, in front of the main road of Yos Sudarso that has an easy direct access to toll road, particularly for private cars. For those who take public transport also can get off just right in front of mall. In addition, MAG provides various coffee shops such as Starbucks, Coffee Bean, Bangi Kopitiam, J'Co Coffee, Choco Corner, and many more.
- c. As the third place of visitor perceptions, MAG is a mall providing complete household stores (178). Some of them are ACE Home Center and Informa Furnishing, which are regarded as the biggest equipment and household stores. Furthermore, Home Furnishing is the most complete furnishing items in Jakarta occupying all over the third floor. The presence of Diamond, as the most popular supermarket, equips the shopping needs visited by housewives around Kelapa Gading and the surrounding community.
- d. Meanwhile, in the fourth place, MAG is a mall that has a fine dining place (178). This is supported by the availability of a variety of branded restaurants and coffee shops, like; Marugame Udon, Ci Wei, Ta Wan, Red Bean, Warung Tekko, Sate Khas Senayan, Imperial Lamien, XO Suki, Pizza Hut, KFC, A & W, Singapore Tau Fu, Batam Fish Soup, Fiesta Steak, etc. As for the coffee shops, among others are Starbucks, Bangi Kopitiam, Bread Talk, J'Co, Beard Papa, Dunkin Donuts, chattime and Choco Corner.
- e. For the brand association, MAG lacks interesting events (169) and less complete branded fashions (163). So this issue needs to get more attention if MAG has a willing to improve its brand image.
- f. As for the lowest brand association that needs serious attention to improve brand image is that MAG is necessary to make a trendy hang out place for young people (146).
- g.

Figure 4:- Perceptual Mapping Image of MAG

Based on Figure 4, it can be revealed that visitors generally have a somewhat good image on MAG in spite of the fact that there are still some lacking points that need serious attention and improvement to enhance the brand image of MAG.

The analysis on perceptual mapping image:

- a. The highest visitor Image is on cleanliness (398), which is in line with the research finding that the janitors' quality services rank above average position.
- b. The second image is the comfort of mall and excellent security (390). Based on data from the operational department of MAG that crime rate decreases for 16% such as theft, and fraud. However, it still lacks the security officer services to visitors. That's why it needs more attention and improvement.
- c. Restrooms' condition (382), lighting (382), escalators' conditions (384), and availability of ATMs (384) rank third.
- d. The following points that need to be addressed and improvement are the decoration of the mall (369) that seems monotonous. The elevators (lift capsules) are always full because the location of other elevators (north and south elevators) is quite far from the atrium. Parking space is less convenient due to lack of parking capacity.

(370) especially during weekends and holidays. The last one is redemption counter (370) that is located in the distance.

- e. Next, the things that should be a priority for immediate improvements, such as the arrangement of the corridor (366) which seems rather chaotic, low store employees' services (364), and lack of sign directions (361), tenant directory (355) and posters publicizing the events (352).
- f. The last one is the most urgent thing that needs to be done, namely, the less availability of seats (355) inside the mall causing discomfort which affects the image and perception; and less responsive of parking attendant services.

The effect analysis of brand image, service quality and marketing communication on the stages of purchase decision at MAG.

- a. The purchase decision process begins when a prospective buyer is aware of the need, which is due to internal and external stimuli. At this stage, a brand image, service quality and marketing communication have not had any effect on a potential buyer. This is consistent with the research findings about the correlation of brand image, service quality and marketing communication and the problem identification dimension. It shows that there is no relationship between three variables and the dimension of problem identification.
- b. At this stage, a consumer, who is driven by needs might look for further information. Therefore, the most influential variable for a person to look for information is a marketing communication variable. If we look closely at the correlation matrix table among six dimensions, marketing public relation is the most influential variable to attract visitors in the stage of information search. While the variable of service quality has no effect on the visitor. This might be because the service quality of a mall does not have any effect on a person's need.
- c. At a later stage, a consumer will process all information about the selection of the brand to make the final decision where the consumer will give different weight to each attribute of the product in accordance with his/her interests. In this stage, brand image is the most influential variable in making alternative choices. Before making decisions, normally the consumer will pay attention thoroughly, efficiently and effectively in selecting the desired product. And the most decisive factors are brand image and today's trend. The service quality ranks second place and marketing communication ranks the last, this is because a person is not too affected by a marketing communication in this stage.
- d. The fourth stage as the evaluation stage is the execution of a purchase where consumers lists brands in the set selection and do purchase intentions. In the execution of the purchase phase, a consumer would select preferred brands. On the other word, brand image becomes the most affecting variable in the execution of purchase. Indeed there are other affecting factors such as attitudes and unforeseen factors. However, in this study, the variable of brand image has the highest impact.
- e. After the purchase of a product, the consumer will experience some degree of satisfaction or dissatisfaction. In this stage, brand image becomes the most influential variable on the purchase satisfaction as the goods have been tested and have proven quality. Brands can have a high value due to brand building activity that is not only based on the communication but it is also all sorts of other efforts to strengthen the brand. Of communication, the brand can promise something and can signal something (brand signaling) too.

Conclusion:-

- a. In general brand awareness of Mal Artha Gading is good, and its association has started to appear. This can be seen from the brand image of the mall as the most influential variable on purchase decision of customers. To build a strong brand image MAG provides various facilities, like fashion, entertainment, children playground, meeting point and sport centres; this aims to build an image of MAG as a mall for family. The mall also provides high class service so that an image of high class, sociable, comfortable, and safe mall is created; this will form perception of the society and its visitors toward the mall that it is the main choice to do their shopping dan to fulfill their daily need. Whereas there are some aspects including event, brand fashion add, trendy hangout places among today's young generation, which still need improvement.
- b. Service quality has the lowest influence on purchase decision in Mal Artha Gading. This is a result of the quality of its employees who do not meet the needs of the visitors
- c. Marketing communication applied by the management of Mal Artha Gading influences the improvement of mall awareness of people in Jakarta. This influences the purchase decision of the customers. The research result shows that the use social media, internet infrastructure, and mobile application in Mal Artha Gading is effective in informing activities done in the mall. However, the use of advertising, billboard, and promotion media has not been maximum. As a result, the impact of advertising the events is not significant.

- d. Brand image and marketing communication influence the purchase decision simultaneously. Meanwhile, the other variable, service quality, influences partially, and it is not significant.
- e. This research is considered to be valuable for the management of MAG since by referring to each influential variable the most important dimension and the less influential indicator can be found. As a result, the management can make a required policy for increasing number of visitors.
- f. The strength of this research is that it is able to reveal the most important dimension or indicator to be improved so that the number of visitors can increase. Referring to the finding of the research, some substantial and valuable inputs for further theoretical and practical development can be made.

Recommendation:-

- 1) To improve the number of visitors, the service quality through the availability of alternative places for eating and meeting point is required. Then to increase its trendy image, regarding its customer buying power, to provide Korean and Japanese restaurant becoming trend and affordable brand is highly recommended.
- 2) Service quality of front liner needs improvement. Providing a special officers who actively approach the customers needing help can be implemented; this results in a more sociable and friendlier image of the mall.
- 3) For future research, variables including product quality, customer satisfaction, people, and other processes can be examined and analyzed. Besides, to obtain more accurate results and to reveal more findings, applying other analysis technique such as path analysis is suggested. This research is expected to help retails company and similar companies improve their sells in this fast changing business era.

Key words:-

Low vision people, SOMDVIC [social multimedia descriptive system for visually challenged] app, media capture and admin activities.

Abstract

towards technology. Low vision persons make use of vision and other senses to understand and learn. Low vision means severe visual impairment; they cannot read the content at a normal viewing distance, even with the help of power glasses or with lenses, not with necessarily limited to distance vision. Carrying out of their daily activities is often a major problem. Activities that are previously taken for granted, such as dressing, eating, writing, travelling and simple communications or interacting with other people are hampered. One of the mobile applications was proposed to facilitate them, to identify and tell the things or information through voice by a social networking people using photos, videos or by sending portable document format [pdf] image which is to be uploaded by the low vision people. This will help them to identify things which are before them without interacting with their neighboring people so that they can proceed in a hopeful manner. This paper was proposed with a mobile application developed for low vision people.

Today, we are in modern world;
it is changing at neck speed

Introduction:-

Internet and mobile computing bring much convenience to most people. Some may have a wrong opinion that persons with disabilities, those visually impaired or low vision, are unable to use mobile devices and mobile applications. Mobile application developers are not aware of the disability groups in using mobile devices of their special needs. Persons with disabilities are using touch screen mobile devices nowadays. Mobile devices and applications, Information and Communications Technology are used by visual impairment people anytime and anywhere more effectively, live more independently and participate fully in the society.

Accessibility of Mobile Applications:-

A high responsibility was given for mobile communications for doing businesses and for delivering a wide range of applications. So making accessible applications in mobile not only benefits the people with disabilities but also fulfills legal understanding and responsibilities, building corporate image and widening customer base. For enterprises and organizations opportunities opens to develop accessible applications on mobile platform in order to develop the fast growing digital economy and harness the technology innovation. It is necessary for mobile

application developers that there is need and importance of accessibility requirements of mobile applications with the different needs of different segments of the community. There are two types of accessibility in mobile apps

- Automated. E.g.: using algorithms.
- Social network. E.g.: involves humans.

A. *Mobile Applications*

Mobile applications are of 3 different types which are as follows

- A web app is launched by mobile browser and it was an internet based application.
- A native app can be downloaded it is a platform specific software and it can be used even though in offline.
- A hybrid app is a combination of both native app and web app.

Mobile applications are usually referred to native apps or hybrid apps which require downloading and installation on a mobile device

Literature Survey:-

Low vision is ubiquitous problem for people having difficulty in viewing objects even with correct lenses. Persons with low vision use mainstream computing devices, to access information when accessibility tools provide sufficient support remains understudy [37] findings delivers the needs of low vision people and improved design opportunities for low vision accessibility tools. It is a major problem in our day to day society. Even then technology is always one step before and new inventions are found before we address the accessibility problems for low vision people. Addressing these issues is very difficult for making new inventions are mobile devices and tablets where there is no proper set of guidelines [21]. Independence and mobility are other important problems with people having visual impairment, they often face difficulties in their navigation [8] accessibility collaborative makes improvement to make web more adaptive to improve process with invited users [10]. Social Accessibility project is a new driven improvement for collaborative metadata authoring technologies [38] interface and applications are written by developers [1]. Several middleware models are proposed and graph sketching tool, blind screen reader, node-link diagrams are shared with sighted people [3] with a real time. 3D's and accessibility dimensions of the built environment [5] specifically, they highlighted that human computer interfaces at the time generally failed to take into account the needs of disabled users. Appliance reader broadly describes the hybrid approaches, which combines human and machine intelligence for interactive access technology [7]. An exploratory study describes the development of access lens hardware and software, the interactive design of access lens in collaboration with blind computer users[12] the characteristics of CS in context makes possible pathways in the field[13]. In addition to compatibility having screen readers, refreshable braille displays and magnification software is designed to low vision users [17]. The mobile cloud computing is becoming a dominant way for various mobile applications [19]. SIMON use ICT services to promote mobility impaired people in the context of on-street public parking areas and multiple transport modes [22] access to information by disabled people has been hampered by short sightedness on the part of computer and communication systems designers [23]. Information and communication technologies (ICTs) become diffuse, with developers and designers to consider users with disabilities and aging populations [27]. Front-end users with mobile devices and back-end cloud servers includes mobile cloud computing. This module helps to access a big volume of storage with distributed portable devices [29] research reveals creativity to CS as a pathway [30]. As ASSETS attendees, it is clearly promoting accessibility computing. Most such courses are aimed at upper-level students [31] Helping users with visual impairments understand the actual issues is a crucial and challenging topic, and will lead to improved accessibility[32] a combined Cloud-Internet of Things (IOT) paradigm provides scalable on-demand data storage and resilient computation power at the cloud side as well as anytime, anywhere[33] The need to study representative users is widely accepted within the human-computer interaction (HCI) community[34] present a case study with the evaluation of four e-government mobile applications.

EXISTING SYSTEM:-

Visual impairment:-

Persons with visual impairment who are having low vision, color blindness or color deficiency, are unable to see the screens and controls in mobile applications. Due to their visual constraints, they cannot see the buttons and use a touch screen to access and navigate the mobile application functions. Most persons with visual impairment rely on a screen reader to operate computers as well as mobile devices. A screen reader is software for converting information displayed on the device screen into speech or Braille on a Braille display. Some mobile device has gesture features with screen readers so that persons with visual impairment can hear functions and operate the functions through touch.

Accessibility features:-

- Screen reader – Nowadays, mobile devices have built in screen reader to facilitate the needs of people.
- Adjustable font sizes – it is used to enlarge the font size in mobile applications through built in feature.
- Screen magnifier – to enlarge the display screen.
- Adjustable brightness/contrast controls – This is used to increase the background color of the screen according to the individual needs.
- Backlit display – it is used to change the contrast of the screen in outdoors.
- Voice recognition –it is used to control the mobile devices through voice commands.

Accessibility Inspection Tools:-

Some of accessibility issues can be detected using inspection tools and/or simulators. It is recommended to test the mobile application with these tools during development stages as early as possible.

- Color Contrast Check
- WCAG Contrast checker (Firefox plugin)
- Mobile Speak for Windows Mobile (Third-party)
- Talkback for Android (Third-party)
- Voiceover for IOS (Built-in)

PROPOSED METHOD:-

This application is developed especially for low vision people to enhance information through voice by social network people through photos, videos or by sending **portable document format** [pdf] image by them. When this application is created for mobile phones, it is very useful for low vision people to identify the object which can't be identified by them. Developing android application for this challenging environment results in enhancement of low vision people for their virtual vision. This App is named as "SOMDVIC" which works for the low vision people. It works with text message along with voice.

How the app Works:-

- Open the app and touch the screen to recognize your voice for photo or video routine
- Touch to take photo
- Once again touch to send sms.
- Admin will receive a message with a link
- Through that link photo gets uploaded for view
- Admin replies a text
- User receives a voice message about that photo.
- Video gets opened at last to save the thing in that mobile phone.

Features

- Voice message
- Speech Recognition
- Photo capture
- Video capture
- Sending and receiving message through server.

Advantages over an existing system:-

- This app will facilitates the need of low vision people by sending the image of a thing.
- This app provides voice message for low vision people to be clear in their proceedings.
- This app created in Android mobile, will help low vision people anywhere in the surroundings to know their needs.

EXPERIMENT AND RESULT ANALYSIS:-*Implementation Tool:-*

It is an android based mobile application so one should have android mobile phone to use this application.

Least Hardware Requirement Environment**TABLE 1:-**

Hardware	Least requirements
System	Windows 7[64 or 32 bit]
Hard Disk	500 GB
Monitor	15 inch color
RAM	2 GB

Software Requirements:-

This Application is supported by android mobiles having lower version of API 8: ANDROID 2.2 [Froyo] to API 18: ANDROID 4.3 [JELLY BEAN].

Software used:-

adt-bundle-windows-x 86-20130917

The bundle comprises of eclipse android development tool with SDK manager build: v22.2.1-833290

Development tool:-

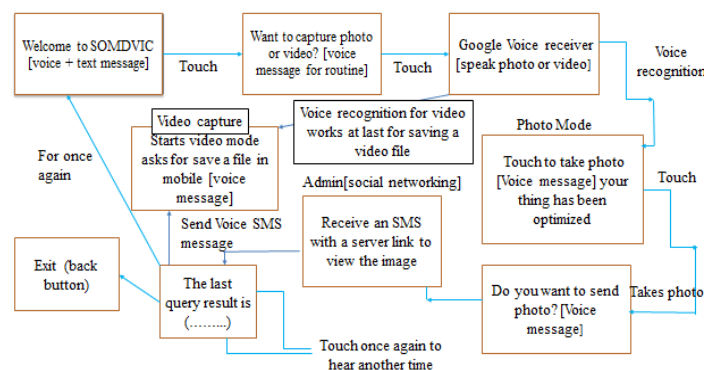

Eclipse android development tool with an android Emulator.

SOMDVIC Mobile application development:-

The SOMDVIC application is developed using eclipse android development kit. Code was made using java programming language. The user interface is created using XML language.

Server:-

Mobile application server consists of operating system and server hardware. These functions on side by side allow the server to remote access and provide services to apps, which contains security features, authentication and updates. In this, the mobile app server communicates with the client to enhance data and balancing load. It makes the admin to configure settings, make out updates and wipe the data's from current location. Because this app is a type of hybrid mobile application we can use any type of server side technology, like a classic web server technology (using JAVA, PHP or .NET) or some kind of cloud technology. Eg: Parse.com

**Fig. 1:-Overall Module****Server used for this App:-**

In this App, server is used as a kind of cloud technology for loading and storing of data. The Cloud Technology used in this App is Heptotechnologies.com

A. Modules

The modules involved in the design of this application are as follows

- Media Capture
 - Image Capture.
 - Video Capture.
- Admin
 - SMS activity [Sending and receiving SMS]
 - Server Link

Media Capture:-**Image Capture:**

This app is developed for low vision people to capture images hence photo mode is used in such a manner to take photo. In this photo module, the resolutions are set out in pixels to capture images in good looking manner. If the persons changes in different directions also it takes the image in pixel format. Touch makes to take photo.

Video Capture:

Video Capture is done in this app for saving things which are captured as an image. People having low vision are not able to see some views clearly so this app facilitates image but it is not saved in their app hence for future reference this app provides an option of video capture to capture videos. Video mode is carried out by voice recognition at the beginning of the application, at last it takes to this mode to save videos. Touch to start, end and save videos. If you don't want a video option, leave it as such don't speak when voice is recognized.

Admin Module:-**Sms activity:-**

After image capture is over, the image has to be send to the Admin mobile. The Admin is the social networking person who helps the low vision people to understand the image send by them through voice. After taking image, the person has to touch the screen to send sms to admin. Admin will receive the sms as an server link. Hence after viewing the image the admin will send the reply as an message. It will be received in this app through voice. Steps involved are

- Sends sms after the image was taken.
- Admin receives sms.
- Admin opens the image through server.
- Admin reply through sms.
- Low vision identify by voice message through this app.

Server link:-

As soon as the message is received by the admin, he/she views the message as a text with link when the admin touches the link it opens the cloud server link and displays the image. Cloud server is the one which stores data in its server. After viewing the image the admin came to know about the image. The admin will reply through sms to that application.

Procedure to use the app:-

This is the first viewing screen for SOMDVIC app, next touch the screen Figure 2.

Fig. 2:- Application

It will show Google voice recognition to speak Figure 3. Next this Google voice recognition is used for finding photo or video mode.

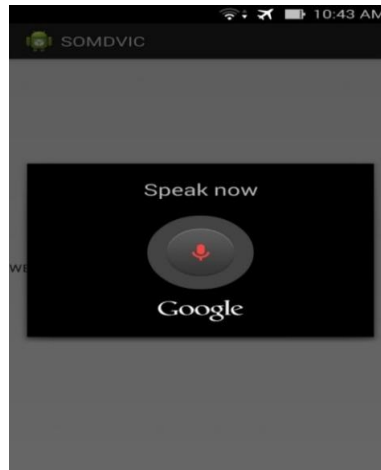

Fig. 3:- Google Voice Recognition

Sometimes it may fail also because of insufficient network facilities but it used for mode change in this application it is shown in Figure 4.

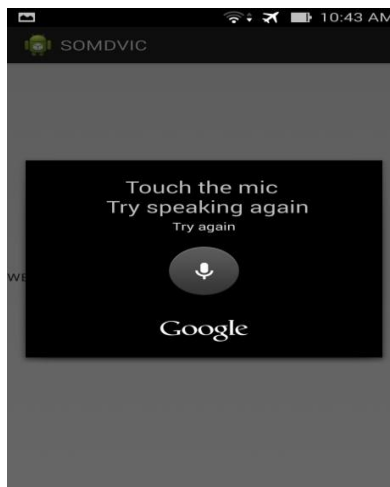

Fig. 4:- Google Voice fails to capture your voice

If you speak photo it takes you to the photo mode as shown in the figure 5.

Fig. 5:- Photo mode

If you speak video, it takes you to the video mode as shown in the figure 6.

Fig. 6:- Video mod.

Fig. 6:- Laptop photo capture in this App

Now the app takes this laptop in the photo mode and again touches to send the SMS to server. The laptop is taken as a picture in photo mode and it was shown in the figure 6.

Fig. 7:- Server reply through App

Social networking people receive this message to give back the reply. If they type it is a lap it will be received by this SOMDVIC app and it is replied through voice in that app as shown in Figure 7.

Fig. 8:- Saved video can be watched.

Video can be also be captured using this application and it was saved using options in this application and it can be viewed later or send it to server to get the information used in that video. The image used for video capture shown in Figure 8. We can watch the saved video.

Conclusion:-

It is difficult to adopt a technology for people with physical disabilities compared with normal people. The mobile app had been developed for low vision people across the world. Android applications are not very much common for low vision people, but they are using and accessing it in their daily activities to some extent. Many smartphones app has usability issues for low vision people. In this app, we evaluate the image of anything, through which low vision people came to know about the image for further enhancement process. This will help them to identify things which are before them without interacting with their neighboring people. This app was created as a guidance to increase the smartphone application for low vision people. The result of using this app, is better in terms of usability, persons have low vision find their routine daily works easily to accomplish it.

Future Work:-

This application was proposed, it provides a way for better application development to help low vision users to carry out their routine tasks efficiently and smoothly with the help of latest technologies. In Future, this app can be connected to what Sapp, twitter etc., to enlarge social networking environment for low vision people.

Abstract

With increase in use of Internet among public and availability of digital data sharing has taken industry professionals and researchers to give independent focus on information security. With growing internet users frequently required digital media store space to receive and send private information and this information requires protected against unauthorized attacks & access. In this paper I have presented a new technique for providing secure encryption to the user data. New proposed secure encryption will consist of a combination of RSA Encryption, Steganography along with digital signature.

Introduction:-

Cryptography offers us the ability to transmit critical data between resources in a way that protect from third party reading it. Cryptography also provide authentication of someone and data. Following types of algorithms are used to specify cryptographic algorithms:

1. Secret key: Encryption and decryption done by single key.
2. Public Key: Two separate key are used for both process.
3. Hash Functions: A mathematical transformation to irreversibly encrypt information^{1,2}.

Steganography technique overlaps the existence of the secret data from an observer into a cover media. Three primary accessories are needed before performing steganography. First is information or data, Secondly Cover data medium and most important hiding technique. The cover medium can be a text file, an image, an audio file or video file but the most popular is the Image steganography. Primary objective of this technique is to avoid attention from the transmission of hidden information. If intruder detected any changes in the content or material, then the objective that has been processed to achieve the security level of the secret data is at risk, intruder will anyhow try to get the hidden data inside the message.

Background:-

RSA Algorithm is designed by Ron Rivest, Adi Shamir, and Leonard Adleman in 1978 is represented in figure 1. It uses two big prime numbers randomly generated to define the public and private keys. The two different keys are used for encryption and decryption purpose. Sender, when the message gets transmit to receiver, encrypts the message using Receiver public key and then receiver can decrypt it using his own private key^{3,4}. RSA operations can be divided into three broad steps; key generation, encryption and decryption.

Key Generation⁵:-

1. Select two distinct large random prime numbers p & q such that $p \neq q$.

Corresponding Author:-Pooja Ahlawat.

Address:-M.Tech Scholar, Dept. of Computer Sc. & Applications, M.D. University, Rohtak, India.

2. Calculate: $n = p \times q$.
3. Calculate: $\phi(n) = (p-1)(q-1)$.
4. Select an integer e such that $1 < e < \phi(n)$
5. Calculate d to satisfy the congruence relation $d \times e = 1 \pmod{\phi(n)}$; d is kept as private key exponent.
6. Public key is (n, e) and private key is (n, d) .

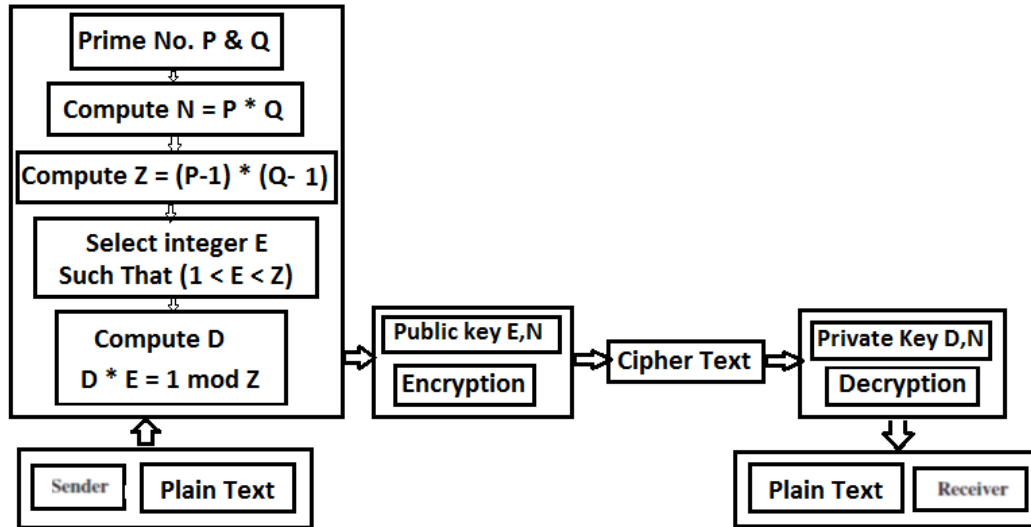

Figure 1:- Block Diagram for RSA

Encryption:Plain text: $P < n$ Cipher text: $C = P^e \pmod{n}$.**Decryption:**Cipher text: C Plaintext: $P = C^d \pmod{n}$.**Proposed Methodology:-**

Required robustness and security can be achieved; steganography & cryptography is combined along with additional digital signature that provide third layer of security. For cover media I will take Image for steganography and RSA algorithm will be used for encryption and is represented in figure 2. By combining, the data encryption will be done by RSA and then the cipher text will be used as input with Image media with the help of digital signature. The combination of these two methods along with digital signature will enhance the security of the data embedded.

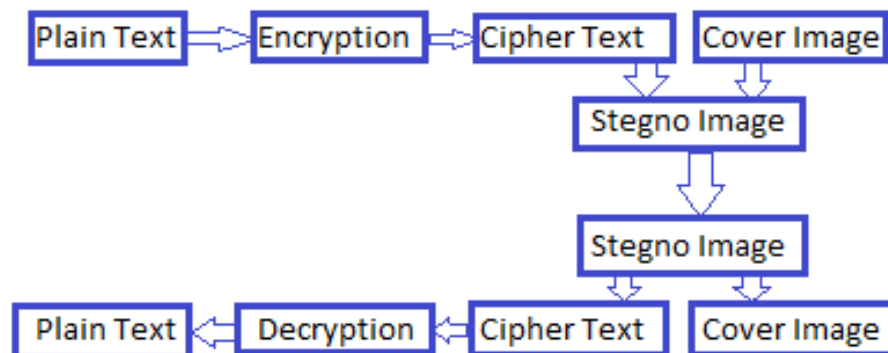

Figure 2:- Combination of Steganography and Cryptography

Working Architecture:-

A development of the complete proposed model is completed and the implementation of Encryption Process is also completed. As encryption is lifelong work to secure data. Day after day new and advanced techniques will be required to secure our data from hacker.

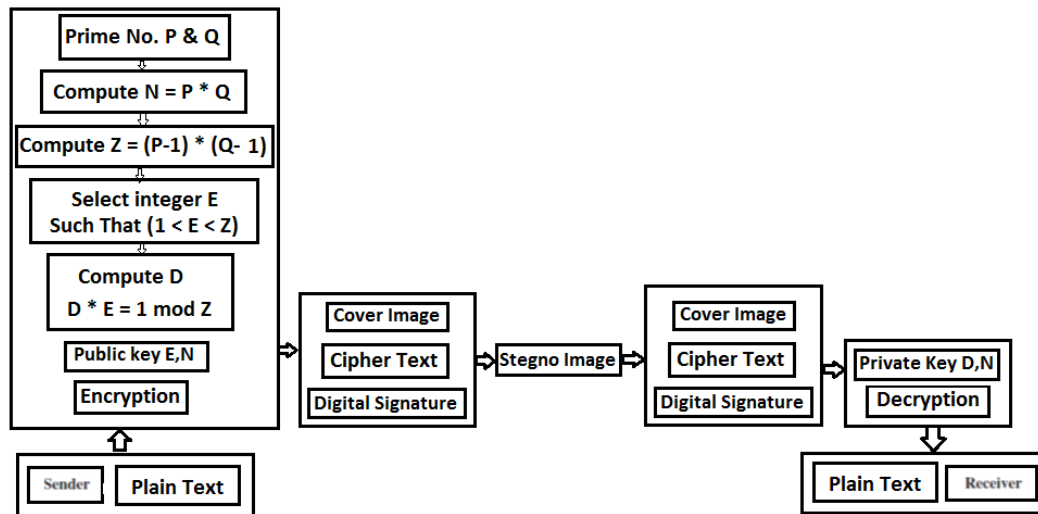

Figure 3:- Detailed Architecture for Proposed Technique

As details architecture is represented by in the figure 3. The Process is stated by converting plain text of uses into the cipher text by using RSA encryption process, Cipher text as plain text for Steganography, Cover Image required is input by user, Digital Signature that is of user choice. Here in implementation I have considered four – digit numeric value for digital signature and that is entered by user. Encryption Process is completed as per the detailed Architecture.

Results:-

According to the details architecture of the proposed new techniques shown in figure 3 I have developed new model. Figure 4 contains the complete encryption process. In Figure 4(a) contains the public & the private key randomly generated with the help of RSA encryption process and Figure 4(b) contains the data to be in secured. Figure 4(c) contains the cipher text that is obtains from RSA encryption process. Further Figure 4(d) contains the source of the cover media along with the last layer of security that is digital signature. And the final image Figure 4(e) contains the final message with the save new media that contains data to be hidden.

Decryption process is illustrated in figure 5. Figure 5(a) contains the source media that contains data along with the digital signature both value input by the user. Further figure 5(b) contains the cipher that is obtains from the step one of decryption process that separates cipher text from cover media with the help if digital signature.

Conclusion& Future Work:-

By this extra layers of security will be available to provide security to our document in today's words. If any how intruder is able to detect the text in the image. Then also that text is no more than cipher text and is also secured by digital signature. Thus triple Encryption is provided to the user data. Decryption process is not completed in the development of this model. My encryption process is working as per proposed model.

Gastrointestinal (GI) parasitic infections;
sheep; *Haemonchus contortus*; ovine-
parasite-environment interaction;
haemonchosis

Abstract

Gastrointestinal (GI) parasitic infections are a world-wide problem for both small- and large-scale farmers. Infection by GI parasites in ruminants, including sheep and goat can result in harsh economic losses in a variety of ways: reproductive inefficiency, decreased work capacity, involuntary culling, diminished food intake, poor animal growth rates and lower weight gains, treatment and management costs, and mortality in heavily parasitized animals. Among the GI parasites that cause losses to the farming industry, the barber's pole worm *Haemonchus contortus* is the predominant, blood-sucking, highly pathogenic, and economically important nematode that infects small ruminants. Here, we review the historical and recent literature on the ovine-parasite-environment interaction for *H. contortus* to bring avenues where advances in the understanding of these interactions is an indispensable to develop a cost effective control strategies as potential options for the haemonchosis control in sheep and the proper management of sheep in various production systems.

History of Parasitology:-

The Egyptian Ebers papyrus of 1500 BC illustrates parasitic disease descriptions, which have been proven by the calcified helminth egg disclosure in mummies dating back to 1200 BC. Our earliest ancestors could be knowledgeable of the larger species, such as the roundworm *Ascaris* and tapeworm *Taenia*, which can be observed with the naked eye [1].

In the 17th century, Robert Hooke invented the microscope and our life understanding and disease increased. Further understanding of the invisible, microscopic world has been occurred after the establishment of modern microbiology in the 19th century by Louis Pasteur and Robert Koch [2]. Thanks to modern technology, there have been nearly 300 species of parasitic helminths known to be human parasite. Additionally, livestock, crops and pets are all victims of parasitic helminths, which cause extreme effects on the human population as well [3].

Helminth Classification:-

Parasitic helminths are contained in the following groups: flatworms (platyhelminthes), namely cestodes (tapeworms) and trematodes (flukes), and roundworms or nemathelminths (nematodes). The name helminth was mainly used to stand for worms of the phyla platyhelminthes and nemathelminths; however, it has acquired an extensive sense, being now commonly employed for all worm parasites mentioned above. Below is a simple flow chart to aid in parasitic helminth classification of [4; 5](Fig. 1).

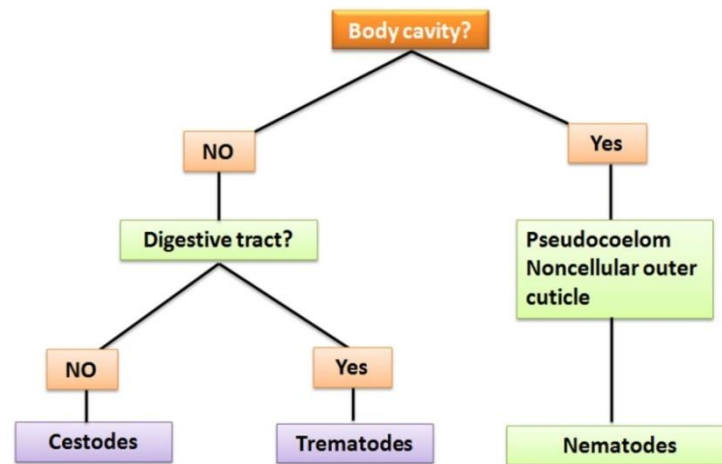

Figure 1:- A simple algorithm for the identification of parasitic helminths.

Nematodes are one of the most diverse groups of organisms on the planet (Fig. 2). Within the animal kingdom, nematodes are second only to the arthropods both in the species numbers and in the individual numbers present. Some are free-living, and many are parasitic, causing devastating diseases and socioeconomic problems world-wide [6].

Figure 2:- An approximate percentage of nematode genera in various habitats.

Gastrointestinal nematode (GIN):-

Livestock are an exceedingly valuable agricultural commodity in developing countries worldwide. They are raised under diverse husbandry systems ranging from large-scale intensive commercial programs to conventional small-holder and village production systems. When ruminants graze on natural pastures, which are common aspect of approximately all production systems, climate plays an essential role in the gastrointestinal nematode (GIN) transmission. GINs are dominant contributors to diminished yield and can reduce the meat, milk and wool production. All grazing ruminants are vulnerable to GIN infections at pasture and any future intensification of pasture-based systems will likely augment the risk of GIN diseases. The restricting environmental variable controlling the worm egg development to infective larvae is rainfall; because temperatures are always warm (i.e. tropical and subtropical regions) enough to facilitate this process. Therefore, there is a direct correlation between the harshness of GIN problems and rainfall in these regions during the wet periods of the year where livestock are raised in the developing countries. They have direct life-cycles with the following patterns: nematode eggs are passed out with faeces of affected animals. The nematode eggs develop into 3rd stage larvae on the pasture. These infective larvae migrate onto the surrounding herbage to facilitate larval pick-up and are ingestion by the grazing ruminants for the parasitic phase initiation of the life-cycle. The infective larval-stage numbers present in the host environment at any given period is related to nematode egg numbers passed by the grazing animal, and this widely determines the parasite numbers potentially established in a susceptible grazing host owing to the absence of pre-parasitic and their infective stage multiplication [7]. Moreover, some of these GINs have diverse development times and stages outside and inside the definitive host; knowledge of which is crucial for effective control measures. Nevertheless, factors such as age, breed, and nutritional status of the animal as well as characteristics of the environment also have a reasonable impact on the GINs and their capacity to infect and inflict deterioration to the grazing host [8; 9]. Grazing sheep are perpetually infected with a wide-range of nematode species, which have been the subject of several reviews [10; 11; 12; 13; 14]. The most important GINs found in sheep and goats are the tricho-strongylids *H. contortus*, *Trichostrongylus axei*, *T. colubriformis*, *T. vitrinus*, *T. capricola*, *Cooperia curticei*, *Nematodirus filicollis* and *N. spathiger*, the hookworm *Bunostomum trigonocephalum*, the strongylids *Oesophagostomum columbianum* and *Chabertia ovina*, the trichurids *Trichuris* spp. and the oxyurid *Skrjabinema ovis*. Moreover, it has been reported that the most important nematode parasite in small ruminants that are reared in warm climates is *H. contortus* [15; 16; 17], which is also important in countries with a temperate climate, including Sweden and Canada [18; 19]. One has to bear in mind that *H. contortus* and *Oe. columbianum* are of considerable clinical and economic importance on sheep and goat production. *H. contortus* and related species belong to a large order of GINs (Strongylida) of animals, including humans. Haemonchosis caused by *H. contortus* represents ~15% of all gastro-

intestinal diseases of small ruminants world-wide and results in extensive financial losses (<http://www.fao.org>). *H. contortus* is a blood-feeding worm that leads to anaemia and associated complications, causing death in extremely affected animals [20]. It causes diminished production and economic loss due to treatment costs and control measures [21; 22].

History of *H. contortus* nomenclature:-

H. contortus was first characterized in 1803 by Rudolphi [23]. Primarily, the parasite was termed *Strongylus contortus* [24] and It was however, not until the 1900s that *H. contortus* became the approved nomenclature [25; 26]. There have been different common names associated with *H. contortus*, including barber's pole worm, twisted stomach worm, and wire worm [27; 28; 29].

Taxonomy:-

Haemonchus contortus belongs to the family Trichostrongylidae as outlined below[30]:

Class: Secernentea

Subclass: Rhabditia

Order: Strongylida

Superfamily: Trichostrongyloidea

Family: Trichostrongylidae

Scientific name: *Haemonchus contortus*

Common name: Barber pole worm

Haemonchus contortus life cycle:-

H. contortus is an abomasal [31] and compartment 3 (C-3) blood feeding nematode of small ruminants (a four-chambered stomach/sheep) and pseudo-ruminants (a three-chambered stomach/ camelids) [32], respectively. The common parasite name is the barber-pole worm on account of the white reproductive tract is wrapped around the red blood-filled intestine give a twisted or barberpole appearance [33](Fig. 3).

Figure 3:- *H. contortus* showing barber-pole appearance with white ovaries twisted around red, blood-filled intestine (A), and male and female *H. contortus* adult recovered after necropsy (B).

As shown in Figure 4, the parasite has a small buccal cavity with a single tooth, called the lancet, which is made of cuticle and is used for feeding by slicing the ovine mucosa [31].

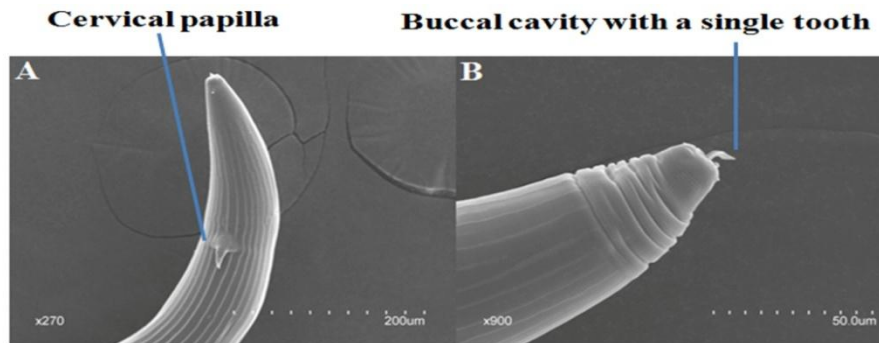

Figure 4:- Scanning electron micrographs (SEMs) of *H. contortus* -anterior end with cervical papilla and lancet tooth, which is used to initiate blood flow for feeding.

H. contortus has separate sexes and adults can be visualized with the naked eye. Adult females are 20 to 30 mm in length, tapered at both ends, and usually have a vulvar flap. Males are 10 to 20 mm in length and are tapered at the anterior end. The posterior end of the male has a copulatory bursa and spicules with a barb at the end used to hold open the female's genital opening during mating[31]. The adult males possess a peculiar three-lobed copulatory bursa involving two symmetrical lateral lobes and one asymmetrical dorsal lobe [29]. The *H. contortus* life cycle is direct, and the prepatent period is 16-21 days in small ruminants. The life cycle pattern can be categorized into four stages; these are: the parasitic stage (the interaction between the sheep and the parasite); the contamination stage (eggs are passed in the faeces during defecation); the free-living stage (larval-stages develop and survive); and the infection stage (infective larvae are consumed during grazing). Adult worms only live for a few months and reproduce sexually in the host. Females may lay thousands of eggs per day that pass out in the host faeces. *H. contortus* egg are regular, large, ellipsoidal, slightly flattened at the poles and morula not fully filled cavity of the egg with an average size range of 76-81 x 44-46 µm [34; 35]. Under ideal conditions (temperature:31°C-34°C and relative humidity: above 85%), larvae hatch from eggs in the faeces [36]. As mentioned above, the first-stage larvae (L_1) develop further and molt to become the second-stage larvae (L_2), which occur within the manure where the larvae feed on bacteria. After a second molt, larvae become the infective third-stage (L_3) about 5 days after passing out in the faeces. These larvae maintain the cuticle of the second stage as a protective sheath, which protects the L_3 from harsh environmental conditions and prevents it from feeding [37] (Figure 5).

Figure 5:- *H. contortus* life-cycle stages [38].

(A) *H. contortus* egg. (B) *H. contortus* L3 larva. Slender larva, tail sheath medium length ($> 50\mu\text{m} < 100\mu\text{m}$), tapering to point and often kinked. (C) *H. contortus* adult female vulval flap. The blue arrow is pointing to the vulval flap. (D) *H. contortus* adult male bursa. The red arrows are pointing to the capulatory bursa (1) spicules used to hold open the female worms genital opening (2).

Infective L₃s rely on stored energy as they travel from the faecal mass to the vegetation to be swallowed by sheep [33]. In supportive warm and humid climates, transmission can occur year round. L₃s can survive in the pasture up to one year under these conditions. Nevertheless, survival is usually weeks to a few months in cold climates. Infective L₃s undergo an exsheathment process in the forestomach and the exsheathed L₃s penetrate the abomasal mucosa and molt to the fourth-stage larvae (L₄), which return to the abomasal lumen and develop to dioecious haematophagous adults within ~3 weeks following the ingestion of L₃s [39]. The L₄s are distributed widely in the anterior fundic area and are almost completely absent in the pyloric region; however, adult worms are distributed in the posterior fundic region of the abomasum closer to the pyloric area, which may be a selection by adult worms of a more supportive feeding site, or an avoidance of the host reaction in the area parasitized by earlier larval-stages [40]. Between 9 and 12 days after infection, the L₄s migrates back out into the lumen and molt one final time to the pre-adult stage (L₅s) under normal development conditions), which then develop into the reproductive mature adult to finalize the life cycle.

Hypobiosis:-

Haemonchus, *Trichostrongylus* and *Teladorsagia* have developed an extraordinary adaptive mechanism, referred to as hypobiosis or arrested larval development, to survive during harsh environmental conditions and ensure persistence (winter cold or summer heat)[41]. Hypobiosis [42] can be defined as “the temporary cessation of development of nematodes at a precise point in early parasitic development, where such an interruption contains a facultative element, occurring only in certain hosts, certain circumstances, or at certain times of the year and often affecting only a portion of the worms.” There are two types of arrested development that occur in GIN parasites. The first is designated immune-mediated arrest (non-specific). It is elicited by either host-related or parasite-related factors at any time of the year. The second is designated seasonally induced arrest and occurs at the same time each year. This type of hypobiosis is similar to diapause in insects and elicited by an external environmental stimulus [43]. The latter seems to be the prevailing form of hypobiosis in *H. contortus* [44]. Factors that may act separately or in combination with each other to provoke hypobiotic L₄s include: a) host-related factors, such as host resistance, acquired immunity, and age [45]; b) parasite-related factors, including population density and genetic predisposition[46]; and c) environmental factors, such as temperature, humidity, and photoperiod length. Environmental factors are most likely to be the triggers involved because of hypobiotic L₄s appear to be more seasonal than immunological [46; 47]. Haemonchine hypobiosis is similar to the arrested development phenomenon (diapause) in insects. Diapause is an inhibition of development induced by environmental factors and considered to be genetically controlled. This arrest in development is temporarily irreversible and may continue until either a specific stimulus presents itself or a predetermined period of time has elapsed [48]. The L₄s of *H. contortus* is able to undergo a state of arrested development [49]. They remain in the abomasal mucosa in a dormant (metabolically inactive) for 3 to 4 months, at which time they resume development. The end of hypobiosis coincides with changes in the weather, which causes the environment to once again become conducive to development and survival of free-living parasitic stages. Hypobiosis is beneficial to the *Haemonchus* infection as it is a means of delaying egg production until the external environment is likely to permit larval development in spring, or when moist conditions return; therefore, it is a forceful element in the condition known as spring rise in egg counts. The resumed development of the hypobiotic larvae often results in the events known as “spring rise” and “periparturient rise.” A sudden pronounced surge in nematode egg counts is the characteristic features of these events as a result of the arrested larvae massively reach the reproductive adult stage [50]. Spring rise occurs during the spring and although it is commonly associated with parturition, it is also seen in non-reproducing hosts [51]. On the other hand, periparturient rise harmonize with parturition during the spring lambing/kidding season but may also occur at other times of the year.

Spring lambing (i.e. ewes typically breed in fall and lamb in spring) occurs concurrently with the spring rise (periparturient rise/first rise). Therefore, the rise in the population of L₃s concurs with the augmented availability of susceptible neonates, thus ensuring transmission. During winter months, most L₃s on pasture will die and adult worms inside of the host will senesce, leaving the only surviving parasites as hypobiotic L₄s, which contribute to parasite burdens in the spring. Peri-parturient ewes will begin to produce eggs in faeces. About one month after introduction to pasture, the ewes, and more importantly lambs will begin to have high fecal egg output as a result of hypobiotic larvae emerging from the ewes and acting as a source of infection for the lambs [52]. Infected lambs can

in turn serve to establish a second rise in eggs and larvae in late summer and fall. The seasonality of *Haemonchus* parasite load (i.e. generally heavier following these peaks) provides intervention points for treatment of sheep flocks with anti-parasitic drugs during these crucial times. Environmental conditions, including season and climate, host immunity, and genetics have been implicated [53]. Furthermore, the photoperiod, temperature, humidity, and host immune system relaxation due to periparturition and/or lactation are the triggers for hypobiotic larval emergence. Immunity relaxation in late gestation or immunity suppression by reproductive endocrine activity are hypothesized to play a role in larval emergence from hypobiosis [54]. However, the larval development may also reinitiate spontaneously without the influence of a stimulus after a predetermined length of time [46; 47]. This aspect further exposes the resemblance between haemonchine hypobiosis and insect diapauses [55]. Winter hypobiosis of *H. contortus* has been reported in the northern U.S.A. as an obligatory survival mechanism [53]; however, adult worms would be likely to survive during the unfavorable dry season (November to March) as adults with no serious hypobiosis [56]. Hypobiotic parasites are more resistant to drugs intended for their destruction; nevertheless, macrolide anthelmintics are the only class anthelmintics that is effective against hypobiotic L₄s [41]. The anthelmintic resistance emergence in worm populations reduces the control level of hypobiotic L₄s during the extreme environmental condition. The short life cycle and the survivability of the larvae have implemented *H. contortus* to be a highly infective GIN parasite able to cause a reasonable amount of damage to an entire ovine population. Knowledge of the lifecycle and environmental conditions provide producers with a number of tools to manage GIN parasite infection in their lambs and ewes.

Pathogenesis:-

Haemonchosis is the disease associated with severe *H. contortus* infections of the ruminant abomasum world-wide [57]. Clinical signs of disease may become more frequent following these peaks owing to higher worm burdens. They include severe anemia, seen as pale mucous membranes, periorbital and submandibular edema resulting from hypoproteinemia caused by the *Haemonchus* bloodsucking activity, lethargy, emaciation, weakness, wool loss, and even death [58]. The adult worms feed on host blood and move from one feeding site to another, leaving behind wounds that continue to hemorrhage and resulting in anemia, which is the most common clinical sign. The volume of blood that is lost and consumed with a heavy worm burden may result in the host death [29]. The degree of anemia relies on the abomasal worm numbers. Clinically, haemonchosis can be categorized into three types; hyperacute, acute and chronic. The hyperacute form occurs in young and/or unhealthy lambs exposed over a short period of time to heavy infection (ingested a massive number of L₃s > 10,000), and is rare and results in lamb death [59]. The faecal color from these animals usually becomes dark due to digested blood and sudden death may occur owing to tremendous blood loss. Acute cases usually occur in young lambs that get heavily infected with or without diarrhea, but the host mounts an erythropoietic response resulting in the partial compensation for the blood loss. The parasite burden is mild, 1,000-10,000 individuals, and all ages of sheep are affected, regardless of present health status. Furthermore, anemia is accompanied by hypoproteinemia and edema, which may contribute to death. A common remark in these cases is sub-mandibular edema designated "bottle-jaw" [60]. The L₄s and L₅s larvae and adult worms are the robust blood-sucking GIN parasite; movement of the worm causes wounds and secretion of anti-coagulants resulting in a continuous haemorrhage from the abomasal wall [61]. A 2-month-old male lamb was identified with the history of anorexia, weight loss and dark color diarrheic faeces from a local farm in Jin Zhan village, Chaoyang, Beijing, China (Fig. 6). Clinical examination revealed severe emaciation, lateral recumbent position, and pale and anaemic mucous membranes. Parasitological examination showed numerous *H. contortus* eggs. The animal was died one week after treatment with with single dose of ivermectin (Shijiazhuang Fengqiang Animal Pharmaceutical Co., Ltd), and levamisole (Hebei New Century Pharmaceutical Co., Ltd). Post-mortem examination disclosed serious congestion, pinpoint petechial haemorrhages, and watery bloody contents with diverse minute hair like *H. contortus* worms in the abomasum. Gross lesions, such as petechial haemorrhages on account of the *Haemonchus* parasite attachment and feeding behavior, and severe congestion in the abomasal mucosa were corresponded with the earlier observations [62].

Figure 6:- Two-month old lamb died after treatment and post-mortem examination gross anatomy.

Bloated appearance face (bilateral periorbital oedema) and ovine hind-quarter is soiled with faeces due to diarrhea (A); Abomasal mucosa was severely congested; pin point petechial haemorrhages (B).

The possible pathogenic mechanism, which is responsible for cause of death in haemonchosis is hemorrhagic anaemia, hypoproteinemia and oedema due to vital blood sucking by both *L4s* and adults. Moreover, diarrhoea causes fluid loss and dehydration resulting in hypovolaemic shock [63]. Chronic haemonchosis is noticed in lambs infected with comparatively few worms (100-1,000 individuals), and distinguished by high morbidity and low mortality. Infected lambs are unthrifty, weak and emaciated with or without anemia relying upon the ovine erythropoietic status. Pregnant ewes and does have elevated faecal egg counts (FEC) around the parturition time known as the periparturient rise. Immune response against parasitic infection shortly before and after parturition appears to be compromised owing to reasons yet to be validated [64]. Haemonchosis early diagnosis is fundamental for the infected flock or herd treatment. Generally, clinical signs as well as history are essential for the diagnosis for the acute and chronic forms of this disease. Furthermore, faecal examination can also be conducted to confirm the diagnosis. However, necropsy and looking for adult worms in the deceased animal abomasum for the diagnosis of hyperacute haemonchosis [65].

Common diagnostic techniques-determining how "wormy" sheep are!

Many diagnostic techniques have been currently made available, particularly in the field of molecular biology, biochemistry and immunology. Nonetheless, they are still expensive and not applicable in conventional practice [66]. Parasitized animals can demonstrate several infection signs depending on the GIN parasites present. The general signs include rough hair coat, diarrhea, depression, weight loss, bottle jaw and anorexia. Laboratory diagnostic findings may involve anemia (low packed cell volume), elevated faecal egg count (FEC) and loss of plasma protein.

FAMACHA® eye color chart system

The FAMACHA card was named FAMACHA® after its originator Professor Francois 'Fafa' Malan's Chart. The FAMACHA chart, which depicts five illustrations of ocular membrane colors: 1: deep red (nonanemic), 2: red-pink (nonanemic), 3: pink (mild anemia), 4: white-pink (anemic), and 5: white (severely anemic) [67; 68]. The FAMACHA test is a sheeP- side test that allows approximation of the animal's PCV. It is performed by everting the lower lid of the eye and examining the color of the conjunctival mucosa (mucous membrane). Level of anemia can be roughly evaluated by observing the color of mucous membranes which are areas where there are a lot of capillaries (very small blood vessels) close to the surface so that tissue color reflects blood color. In general, pale or white membranes correlate with varying degrees of anemia, which correlate well with the burden of blood - sucking parasites (Fig. 7). These observations are part of a minimal database that will be an important aid in establishing the nature of disease. These measurements should be made repetitively and recorded, which over time will allow determination of improvement or exacerbation of the underlying condition. In settings in which anemia causing nematodes (mainly *H. contortus*) are predominant, blood PCV and FAMACHA score both are good indicators of the level of blood loss and associated problems. The FAMACHA © system is a selective program for managing haemonchosis in sheep and goats [69]. This system was developed in South Africa and allows owners and producers to rank an animal's level of anemia [70; 71]. The FAMACHA card depicts five colors from red (healthy) to white

(very anemic), which is then matched to the color of the inside of the lower eyelid of the affected animal. The score correlates well with PCV and can be used easily in the field [70]. The FAMACHA © system works by scoring animals on a scale of A to E and is performed by looking at the conjunctival membranes. A score of A or B is indicated as normal, while a score of D or E is anemic. The membranes of the eye are very pale at a score of E. It has been shown to be an effective way of determining, which animals need deworming for haemonchosis [69; 70; 72]. Employing this method diminishes the necessity to deworm all animals in a herd [71]. It is best to establish routine parasite evaluations, including FEC, PCV, FAMACHA, or weight gain at specified intervals (mostly 2 to 4 weeks, depending on expected severity of problems) from parturition throughout the grazing season. Because *Haemonchus* is the only parasite monitored with FAMACHA, attention should be paid to identifying and controlling other parasites when needed (e.g., by faecal egg count [FEC] or fecal culture). Recently, strong correlation among FAMACHA© eye scoring, PCV, and faecal culture positivity has been observed. Additionally, the FAMACHA© anaemia scoring guide can be employed to treat only severely anemic sheep reducing mass treatment and chance of drug resistance[73].

Figure 7:- FAMACHA© eye color chart being used to check level of anemia.

In this sheep the conjunctiva of the eye is being evaluated for color (A), on a scale of A to E (with 1 = normally pink and 5 = very pale) (B).

Body condition scores:-

Determination of body condition score (BCS) is an effective tool for managing both individual animals and herds. In an individual animal, low BCS may indicate disease or poor access to feed. In a flock or herd, a trend toward low BCSs may be indicative of inadequate feed quantity or quality or of management-related diseases, for example internal parasitism. Hands-on examination can be conducted to determine BCSs. BCSs were measured by palpating (physical feeling) the level of muscling and fat deposition over and around the vertebrae in the loin area behind the ribs and in front of the pelvis, and assigning a score of A-E, where a score of A is considered emaciated and E is considered grossly obese [74] (Fig. 8; Fig. 9; Table 1). It has been reported that changing in the body scores are good indicators of the intensity of GIN infection in the Nigerian WAD sheep [75].

Figure 8:- Assessing body condition score by physical feeling.

Table 1:- Body condition scoring in sheep [76; 77; 78].

Assigned score	Condition	Physical Finding			
		Spinous processes	Transverse processes	Loin eye muscle	Fat cover over loin eye muscle
Condition A	Emaciated	Sharp and prominent	Sharp	Shallow	None
Condition B	Thin	Sharp and prominent	Smooth, slightly rounded	Medium depth	Little
Condition C	Ideal	Smooth and rounded	Smooth, well covered	Full	Medium
Condition D	Fat	Palpable as firm line with pressure	Not palpable	Full	Thick
Condition E	Overly fat	Not palpable	Not palpable	Very full	Very thick

**Figure 9:-** Body condition scores (BCSs) for sheep. These drawings demonstrate a cross-section through the lumbar region and characterize the fat covering.**Modified McMaster egg counting for nematode egg quantitation:-**

The coprological approach is the most extensively utilized method to detect helminth eggs and larvae, protozoan oocysts and cysts [79; 80; 81]. FEC plays an essential role in monitoring helminth burdens in herds and flocks, determining the pasture contamination degree and identifying anthelmintic resistance [81; 82; 83]. The McMaster method, which developed at the McMaster laboratory of the University of Sydney, is the most world-wide utilized FEC technique in veterinary and medical parasitology, and is supported by the World Association for the Advancement of Veterinary Parasitology for assessing the anthelmintic drug efficacy in ruminants [84], as well as for the anthelmintic resistance detection [82]. This method has improved diagnostic parasitology, both animal [85; 86; 87; 88; 89] and human [90; 91]. Several McMaster method modifications, including faecal weight and volume and flotation solution type, sample dilution, flotation times, an additional centrifugal application, centrifugal duration and speed, numbers of chambers of the McMaster slide counted and different coefficients for interpretation have introduced [88; 92; 93]. Three selected modifications of the McMaster counting technique, namely the McMaster method modified by Wetzel (W) and Zajčėk (Z), as well as the concentration McMaster technique according to Roepstorff and Nansen (R&N) have been chosen to compare their sensitivity and reliability by [94], however the method reported by Roepstorff and Nansen proved to be the more sensitive and reliable technique (Table 2).

Table 2:- Evaluation parameters of McMaster egg counting technique modifications [94].

	McMaster technique modifications		
	Wetzel (W)	Zajíček (Z)	Roepstorff and Nansen(R&N)
Amount of faeces (g)	2	1	4
Flotation solution type	NaCl	MgSO ₄ + Na ₂ S ₂ O ₃	NaCl + glucose
Solution specific gravity	1.2	1.28	1.3
Centrifugation (RPM)	None	2,000	1,200
Centrifugation time (min)	None	2/1	5
Flotation time in chamber (min)	2–3	5	3–5
McMaster counting chamber	3	2	2
Multiplication factor	67	33	20

Packed cell volume:-

The packed cell volume (hematocrit) is the ratio of the red blood cell volume (A) to the total blood volume (B) (Fig.10). PCV is an essential indicator of resistance of sheep to *Haemonchus* infection, and is negatively correlated with FEC in sheep (Shakya et al. 2011).

**Figure 10:-** Packed cell volume diagram**Immune response to GIN parasites:-****Ovine immunity:-**

It has been reported nearly 10-35% of neonatal lamb mortality within the first 6 months of life, a mortality rate nearly duplicated that of mature sheep [95] owing to their naïve immune system. Neonatal lambs are almost completely reliant upon passive transfer of maternal antibodies through colostrum in the first 3-4 months of life. Even though maternally-derived antibodies provide protection, they synchronously hamper the newborns from mounting their antibody response [96], due to this inhibition, newborns are not immunized against infectious diseases until they are at least 3-4 month old [97]. Neonatal lambs are especially vulnerable to infection when maternal antibodies are no longer present and have not yet begun to adequately mount their own immune response. The immune system consists of a wide range of diverse effector cells, tissues and organs with complex interactions that allow a rapid response to any foreign invaders [97]. The production of cytokines, and low weight signaling proteins involved in immune cell communication by activated CD4⁺ T helper cells in response to intracellular or extracellular pathogens resulting in the differentiation of naïve T helper lymphocytes into two subsets, T-helper type 1 (Th1) and type 2 (Th2) [98]. Th1-type cells are responsible for the cellular immunity activation, and a Th1-type response is generally noticed in response to viral infection, intracellular pathogens, and the delayed-type hypersensitivity activation. A Th1-type response usually responds to viruses and vaccinations, and is characterized by the cytokines IL-2, tumor necrosis factor (TNF), and interferon- γ (IFN γ) resulting in the mobilization of macrophages, T cells, and natural killer (NK) cells to promote proliferation and inflammation [99]. A Th2 response is distinguished by the elevated production of immunoglobulin (Ig) secretion by B cells, especially IgG and IgE and

the cytokine IL-4, as well as enlarged eosinophils and mast cell recruitment [100]. A Th2-type response is associated with allergic reactions [98], and is also activated upon parasitic infection [101]. There is a balance between the expression of both the Th1 and Th2 responses, even though challenges with diverse pathogens may modify the type and ratio of cytokines expressed, for example the Th2-type cytokine increase during parasitic infections.

Host response to *Haemonchus* infection:-

Inflammation during parasitic infection is necessary in larval and adult stage mucosal worm expulsion [99]. It has been reported that a clear Th2-type response in lambs repeatedly exposed to *H. contortus* [102], discriminated by Th2 cytokine surges, eosinophil, mast cell and globule leucocyte (intra-epithelial mast cell) recruitment, and parasite-specific IgA, IgG1 and IgE elevated production [103; 104]. Antibodies, lymphocytes, eosinophils, globule leucocytes and mast cells act upon larval stages of *H. contortus* embedded within the mucosa and adult worms residing the gastrointestinal tract lumen upon parasitic infection. Effector cells degranulate, releasing vasoactive molecules, which physically expel GINs from the abomasal mucosa [9; 99]. Eosinophils are closely associated with GIN infection, and activated by Th2 cytokines, such as IL-3 and IL-5 [105]. Sheep elicit an early immune response to infection with *H. contortus* larvae, represented by the CD4 T-cell and B-cell activation in the draining lymph nodes and eosinophil, CD4(+) and gamma delta-TCR, WC1(+) T-cell and B-cell recruitment. However, increases in mast cell numbers prevail the local response during infection with the adult parasite [105]. Mediators released by eosinophils include major basic protein, peroxidases, and neurotoxins, and have been demonstrated to have lethal effects against GIN parasites *in vitro* [106]. Mediators act as robust vasodilators, enhancing smooth muscle contraction and subsequent abomasal parasite expulsion [107]. It has been found that sheep with low egg counts had higher numbers of circulating eosinophils, which have been also been associated with larval migration inhibition [108]. Eosinophils and other microenvironmental factors, such as globule leucocytes and IL-4 can effectively kill GIN larvae *in vivo* [109]. Infection with *H. contortus* is associated with the production of mucosal mast cells and globule leukocytes within the GI tract of the sheep [110; 111]. Sheep that are more genetically resistant to parasites have more globule leukocytes than susceptible breeds [112]. Mucosal mast cells, recruited from bone marrow by Th2 cytokines, such as IL-4, histamine release, are eventually becoming globule leukocytes after degranulation [110]. Several studies have recorded the role of mast cell degranulation in worm expulsion [113; 114]; however, quantifying mast cell numbers upon necropsy is not a precise reflection of activation status and can therefore be ambiguous [115]. On the other hand, globule leukocyte quantification has been demonstrated to contribute a more accurate measure of mast cell activity [115].

Factors affecting host response to parasitic infection:-

Age is the most substantial factor in an animal's ability to effectively fight parasitic infection. The immune system develops with age; therefore, young lambs harbor the most serious *H. contortus* infections and account for the bulkiest commercial losses among producers as a result of diminished weight gain and death in extremely infected hosts [99]. The effects of haemonchosis are also more obvious in pregnant or lactating, undernourished, diseased or stressed animals due to a compromised or underdeveloped immune system [116; 117]. Genetic factors also play a role in an animal's resistance to parasitic infection. Several tropical and subtropical breeds of sheep are documented to have more natural resistance to GIN parasites. Resistant breeds include St. Croix [118], Florida Native [119; 120], and Gulf Coast Native [8]. Resistance in these breeds is defined as diminished establishment of larvae and their subsequent development into adult stages [121]. Nutritional status is a key component of the host immune response and the host's subsequent ability to mount an effective defense against GIN infection [122]. It is well-documented that animals on diets deficient in protein or key vitamins have a weakened capacity to combat parasitic pathogenesis, and concomitantly GINs significantly restrict the host's ability to efficiently exploit nutrients [123]. Lambs fed a diet high in protein harbor less severe GIN infections owing to heightened immune response. Furthermore, Immunoglobulin (Ig) A-mediated suppression of worm growth and fecundity is influenced by the quality of the diet [124]. Several studies have shown that supplementation with protein, energy [125], and trace elements [126] enhances host resistance and resilience to GIN infection. Resilience is another concept relating to the ability of the sheep to thrive in the presence of *Haemonchus* and reflects the host response to *Haemonchus* infection (Gray and Gill 1993).

Distribution and importance:-

H. contortus is distributed world-wide in tropical and subtropical regions with concentrations in the tropics and subtropics where there are high temperatures and a lot of rainfall. The parasite can also be found in more temperate areas, such as the United States. It dominates over other GINs, such as *Teladorsagia* and *Trichostrongylus* species in the southeast U.S because of the warm and humid environment. The environmental temperatures (31°C-34°C) are optimum for *H. contortus*; however, it can be existed in temperatures as low as 10°C and as high as 36°C [37; 127]. The hot and dry summer, and relatively cool winter conditions frequently constrain *H. contortus* development to short periods of the year in Mediterranean climates [128], diminishing the risk severity and duration. *H. contortus* is of relatively lesser importance in higher latitudes, owing to shorter and cooler summers, and more severe winters in studies, including Canada [129], Sweden [18], and South Dakota [130]. On the other hand, the existence of *H. contortus* in arid and semidesert areas is likely to witness its survival capacity (hypobiosis) and potential for rapid population expansion [131]. Nearly 60 different species of both domestic and wild ruminants have been identified as hosts for this GIN parasite [58]. Cross-host transmission is possible between wild and domestic hosts, for example white-tailed deer and domestic cattle and sheep [132]. It has a wide host range, including cattle, white-tailed deer, bison, antelope, giraffes, and camels; however, sheep and goats tend to be the favored hosts [133]. Domestic sheep appear to be the most exceptionally overwhelmed, which may be due to their grazing behaviors and strong flocking [58].

Ruminants (pregastric and postgastric microbial action):-

The gastrointestinal tract (GIT) of animals enables them to digest food, absorb nutrients and excrete waste products. The GIT nature is mainly determined by the food type. The stomach of carnivorous and omnivorous animals is relatively simple (i.e. hydrochloric acid and pepsin for primary digestion). However, the simple-stomach animals have a modification of the lower tract, the caecum, which is inhabited by microbes, whose function is to degrade cellulose. Some herbivores (hind-gut fermenters) have developed especially large caeca (e.g. the horse) or have other mechanisms for maximizing microbial intervention in the fiber digestion (e.g. coprophagy in rats and rabbits). The GIT of the ruminant animals has, in addition to the caecal (postgastric) fermentation, a large organ (i.e. rumen), inhabited by complex microbial populations, whose function is to degrade fibrous feed before it reaches the true stomach. The anatomy of the ruminant stomach is well-documented and the interested reader can find detailed descriptions in diverse specialized texts [134].

Only a brief and somewhat simplified description will be presented here. Ruminants are any of the diversified cud (fermented ingesta) chewing cloven-hoofed quadrupeds of the order *Artiodactyla*, obtain their food by browsing or grazing, such as cattle, sheep, goats, buffalo, deer, elk, giraffes and camels that usually have a stomach that are divided into three or four compartments. Ruminants are even-toed animal that regurgitates and masticates its food after swallowing (rumination). A diagram of feed conversion in simple stomached animals versus ruminants is presented in Figure 11. Unlike simple-stomach animals (monogastrics), such as poultry, ruminants have a digestive system designed to ferment foodstuffs and provide energy. True ruminants, including cattle, sheep, goats, deer, and antelope, characterized by their four-chambered stomach, namely the rumen, the reticulum, the omasum, and the abomasum as viewed from outside, in Figure 5, and "cud-chewing" behavior. The reticulo-rumen chambers have a wide variety of microorganisms that are essential for the digestion of plant cell walls and the production of volatile fatty acids (VFAs). On the other hand, the omasum compartment is characterized by the presence of many folds involved in the absorption of nutrients and water. The abomasum is the "true stomach" of a ruminant, and it is comparable to the non-ruminant stomach.

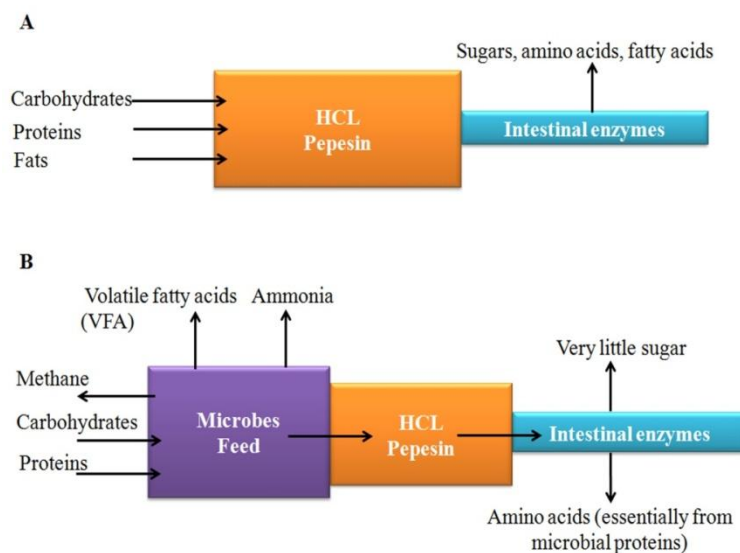

Figure 11:- Food digestion in multi- chambered stomach animals (microbial fermentation prior to digestion in ruminants) versus mono-gastric animals (non-ruminant animals)[135].

In the newborn lamb, the rumen is undeveloped and is small in comparison with the abomasum. The immature small ruminants do not have a functional rumen and reticulum, and undergo reticulorumenomasal growth. Rumen papillae (sites of nutrient absorption) lengthen and decrease in numbers as part of rumen development. The reticulum resembles a "honey comb" in appearance. Digesta mingle continually between both sections. Relatively little digestive activity occurs in the omasum (many piles) (Fig. 12; Fig. 13).

Figure 12:- Illustrating the external structure of the *rumen*, the *reticulum*, the *omasum*, and the *abomasum*, and the relative proportions of stomach compartments in sheep at different ages [7-day-old lambs (A) versus 140-day-old lambs (B)].

Figure 13:- Illustrating the internal structure of the *rumen* (A), the *reticulum* (B), and the *omasum* (C).

History of Sheep:-

The first livestock species to be domesticated were sheep and goats about 11,000 years ago in southwest Asia. They were primarily reared for meat; nevertheless, wool was discovered to be a beneficial product by the 4th and 5th millennium B.C. in southwest Asia and Europe [136]. Sheep then spread across Europe, Asia, and into Africa, developing into numerous breeds.

The mouflon (*Ovis orientalis orientalis* group) is a subspecies group of the wild sheep (*Ovis orientalis*). Populations of *O. orientalis* can be segregated into the mouflons (*orientalis* group) and the urials (*vignei* group). All modern domestic sheep breeds are most likely descended from the wild mouflon of Europe and Asia [137; 138; 139]. *Ovis aries* is an entirely domesticated animal that is broadly reliant on humans for its health and survival.

Characteristics of Sheep:-

Sheep belong to the order Artiodactyla with camelids, suborder Ruminantia, family Bovidae, and subfamily Caprinae [140]. Sheep have an array of sizes, colors, and breeds globally and are considered to be intermediate grazers (i.e having nutritional requirements midway between grazers and browsers).

Economic importance of sheep:-

Sheep are a crucial part of the global agricultural economy. China, Australia, India, and Iran have the bulkiest modern flocks, and serve both local and global requirements for wool and mutton. However, New Zealand has smaller flocks and retains an enormous international economic impact because of sheep product exportations. The conventional essential markets, including European Union (EU) and United States of America (USA) will be enlarged by augmenting demand from developing countries, such as China, Saudi Arabia, Jordan, United Arab Emirates, India, Turkey and Qatar [141]. According to Food and Agriculture Organization of the United Nations (FAO), the ten countries with the largest number of heads (expressed as a percentage) of sheep were: mainland China, Australia, India, Iran, Nigeria, the former Sudan, United Kingdom, Turkey, New Zealand, and Ethiopia. Interestingly, mainland China has changed dramatically from the top three producers in 1961 to the top first in 2014 (Fig. 14) (<http://www.fao.org/faostat>).

Figure 14:- Top 10 sheep producers world-wide.

Sheep versus goats:-

Goat and sheep industry have made monumental gains in productivity globally. Both species provide humans with meat, milk, wool and skins. Goats are well-known as a tough animal that can be fruitful in extreme environments that are not appropriate for other ruminants, such as sheep and cattle [142]. By comparison with sheep, goats have an exceptional ability for walking long distances, are recognized to select the most nutritive plants and can utilize bushes and shrubs [143] (Fig. 15). Several reports showed that sheep and goats share the same species of GIN parasites [144; 145]. Additionally, both sheep and goats can readily transmit GIN parasites to each other [146; 147]. Cross-infection of resistant GIN parasites between these two hosts may occur and must be a significant cause for concern in countries like China where goats and sheep may share the same farming system. Goats prefer browsing, while sheep will rely almost completely on grazing pastures. Browsing diminishes L_3 intake owing to higher numbers of infective larvae are only found very nearby the base of pastures [148]. Similarly, higher faecal egg counts were reported in the Angora goats (grazer) compared to Saanen goats (browser) due to the differences in feeding behavior [149].

Therefore, sheep are more likely to contract GIN parasite infections due to grazing behavior; however, goats do not mount the same level of immune response to the GIN parasites as sheep. Several studies have compared the level of GIN parasite infection in goats and sheep during common grazing when they placed in diverse conditions. The higher faecal strongylate egg counts of New Zealand feral goats are significantly different from those of adult Romney sheep grazing mixed grass and clover swards with no access for browsing [150]. Furthermore, other studies have reported that goats are generally more succumbed to parasitic infection than sheep under grazing systems [151; 152]. Results from another study involving Coopworth lambs and Saanen kids between 6- and 8- month-old grazing naturally infected pasture indicated that after approximately 6 months, Saanen kids had significantly higher faecal egg counts than those of the Coopworth lambs [153]. Previous research comparing sheep and goats has found that the average strongyle faecal egg counts of sheep reduced from the age of 8 months onwards whereas this only happened in goats from 12 to 18 months onwards under the traditional husbandry system in peninsular Malaysia [154]. Faecal egg counts in sheep declines more rapidly due to the earlier development of an effective immune response to GINs compared to goat [155]. A similar picture documented that goats are highly susceptible to GIN infections in general and to *H. contortus* in particular compared to sheep [156]. Poorly developed immunological responses are the primary cause of their relative inability to control GIN infections, and the associated pathophysiological consequences [149].

Figure 15:- Traditional method of goat and sheep housing and management.

The figure shows lambs fed concentrate diets (A), browsing goats and grazing sheep shared the same farming system on pasture in rangeland near their owner's premises at Jin Zhan village, Chaoyang, Beijing, China (B), and sheep and goats confined in their shelter (C).

Abomasal anatomy:-

The abomasum is separated into three obvious anatomical parts. These are: the cardiac region, which contains a small circular area around the omaso-abomasal junction, the fundic/corpic area, which is distinguished by luminal folds covering the major part of the abomasal surface, and the pyloric area, which is the most distal part, is marked by the existence of rugae (Fig. 16).

Figure 16:- Inner structure anatomy of the ovine abomasum.

Histologically, the abomasal wall, like the rest of the gastrointestinal tract, is organized into four concentric layers from the outside inward, which are: the *tunica serosa*, the *tunica muscularis*, the *tunica submucosa* and the *tunica mucosa*. The *lamina propria* has a connective matrix supporting the gastric epithelium and the feeder blood vessels. The gastric epithelium is composed of surface epithelial cells (cuboidal to columnar cells) and gastric glands. The cellular layer forms numerous invaginations, called gastric pits or foveolae serving as draining duct of adjacent glandular secretions to the lumen. The abomasum has two types of gastric glands according to their anatomical location, namely the pyloric and fundic glands (Fig. 17; Fig. 18).

Figure 17:- Normal architectures were seen in the ovine abomasal tissue (fundic region). HE 40X. Bar = 10 um.

Figure 18:- Gastric gland structure from the fundic area (Adapted from [157].)

Abomasum is one of the most important sites for living bursate nematodes belonging to Trichostrongylidae family in small ruminants, because it is the site location for 3 pathogen species of GI nematodes e.g., *Haemonchus* spp., *Teladorsagia* spp., *Ostertagia* spp. and

Trichostrongylus spp. [158]. The histopathology of haemonchosis in sheep has been the subject of intense investigations during the last decades [61; 159; 160; 161]. Abomasal nematode larvae enter the gastric pits and glands, where they cause local lesions, the nodules, which have at their centre developing larvae in distended glands lined by many flat undifferentiated cells, but few secretory cells. These nodules are diverse on the abomasal folds [162; 163]. Adjoining parasitized glands demonstrate mucous cell hyperplasia with fewer parietal cells and chief cells. These changes become more broad after the L₄s or immature adults emerge [163; 164; 165; 166; 167; 168]. Luminal stages stay close to and within the superficial mucus [169]. The infected sheep abomasa are much heavier than control animals and the mucosal thickness is much greater [170; 171]. The pits are expanded and there are fewer parietal cells and chief cells, however, more mucous neck cells (MNCs) and undifferentiated cells [172]. Similar generalized histological changes are observed after adult *T. circumcincta* [168; 173] or *H. contortus* transfer [174] even though there are no damaged glands where larvae have grown. There may be an association between the pathology, histopathology and inflammatory responses to the nematode presence, especially through the parietal cell loss and inhibition. Infection provokes the release of cytokines, including IL-1 β , IFN- γ and TNF- α , which are inhibitors of parietal cells [175; 176; 177]. Parietal cell loss not only results in diminished acid secretion and increased abomasal pH, although fewer chief cells, owing to parietal cells produced growth factors necessary for mucous neck cells (MNCs) to develop into chief cells [178]. In line with these findings, this occurs in other pathologies where parietal cells are lost, for example transgenic mouse models [179; 180]. The increase in mucus-producing cells in general, and MNCs in particular, is consistent with the increased mucin secretion seen in *H. contortus*-infected sheep [181].

Pathophysiology:-

H. contortus- or *T. circumcincta*-infected sheep have increased gastric pH, elevated serum concentrations of pepsinogen and gastrin, and diminished acid secretion [166; 174; 182]. The abomasal pH of uninfected sheep is approximately 2.8, nevertheless the pH may be 4 and above in *T. circumcincta* infected sheep [166; 182]. Previously challenged sheep with *Ostertagia circumcincta* may be able to acidify their abomasal fluid and maintain the pH low, while naive animals lose the ability to maintain abomasal pH [183]. Hypergastrinaemia began at the same time as abomasal pH became increased, however stayed high and continued to augment when pH had reached a maximum and had returned towards normal. Serum gastrin was depressed when abomasal pH exceeds 5.5 in *O. circumcincta*-infected sheep [166; 184].

Hyperpepsinogenaemia is frequently employed in ruminants as an indicator of abomasal parasitism [166; 174; 182; 185; 186; 187]. Serum pepsinogen usually elevates at the time of parasite emergence from the glands or a little earlier and remains increased for up to 30-60 days after a single infection while the parasites are still present in the abomasum in *O. circumcincta*- and *H. contortus*-infected sheep [166; 168; 174; 188]. The magnitude of the increased plasma pepsinogen levels in ovine gastrointestinal trichostrongyles, including *Ostertagia leptospicularis* and *O. circumcincta* varies between animals, from approximately zero [166; 174; 182; 187; 189] to remarkable increase in immune animals, even with small worm burdens [190]. After transfer of adult *H. contortus* [174], *Ostertagia ostertagi* [165], or *T. circumcincta* [164; 166; 168; 188], abomasal pH, serum gastrin and pepsinogen concentrations increase within the first day. These effects on abomasal secretion are proposed to be initiated by abomasal parasite chemicals [164; 166; 167; 168], but later also to include the host response. *H. contortus* excretory/secretory products (ES), which are released by GINs to their environment, consist of diverse bioactive components, including chemotaxins, metabolic end-products, enzymes, immunomodulators and growth factors. ES has been reported to inhibit acid secretion *in vitro* [191], as well as restrain the enterochromaffin-like cells, which may indirectly cause diminished acid secretion by parietal cells [187; 192]. Ovine gastrointestinal nematode chemotaxins recruit granulocytes *in vitro* [193], which could be another way of damaging parietal cells *in vivo* [163; 167].

Conclusion and future directions:-

We have attempted to provide a comprehensive overview about the haemonchine parasite and the ovine host as well to reveal intervention points that could be exploited to discover novel therapies, vaccine strategies and prophylactic intervention points for parasites, and to understand the parasitic disease progression and the infection consequence.

Abstract

The study aimed to determine the effectiveness of Gallery Walk Technique in teaching selected topics in English among Grade Four learners. The hypothesis stating that there is no significant difference between the performance of the experimental and control groups was tested at .05 level. Quasi-experimental research was adopted by the study employing match-pairing of participants. Pre-test was administered to the learners and scores utilized to identify the match-pairs. T-test for independent means was employed to determine if there is a significant difference between the performance of the two groups. For two quarters, the experimental group was taught using Gallery Walk Technique whereas the control group was taught using traditional method. Formative tests were administered during the implementation of the study. Post-test was given after implementing the two methods of teaching. Results revealed that there was a significant difference in their performance. The experimental group performed better than the control group.

Introduction:-

English is a learning area in elementary level in the Philippine educational system. Pupils' performance is gauged based on the results of the National Achievement Test (NAT) administered yearly by the Department of Education. The test aims to provide empirical information on the achievement level of students at certain grade levels. The low Mean Performance Scores (MPS) in English of pupils from 2009-2013 (DepEd, 2013) specifically in reading and grammar indicated that the teaching of English is very much wanting of improvement.

The primary purpose of teaching at any level of education is to bring a fundamental change in the learner. To facilitate the process of knowledge transmission, teachers should apply appropriate teaching methods that best suit specific objectives and level exit outcomes. Identified teaching strategies all over the world are the visual aids, modelled spoken language, lesson outlines, skim and scan, and the like contingent on the set curriculum to improve pupils' performance. Because teaching and learning now come in different styles and forms, educators need to try on adopting new methods in teaching and learning which aim at improving the quality of education. Although some teachers shudder at the thought of having all of the students out of their desks moving around the classroom at the same time, but in reality, it can be a very effective technique for classroom management especially in the elementary level. Meyers, et al (1993) consider active learning as learning environments that allow students to talk

and listen, read, write and reflect on course content. This is enhanced through informal small groups, simulations, problem-solving exercises and other activities.

Stewart (2009) cites in his theory of basic learning that learners had their foundation in English at the elementary level and enhanced in the high school level. Bloom, et al. (1956) in his Taxonomy of Educational Objectives said that students proceed from a lower level of learning such as remembering concepts, comprehension and application to a much higher level. Mastery of the lower level should be achieved first before they are able to analyze and evaluate concepts, processes and procedures.

The five skills of English as a discipline such as reading, listening, speaking, writing and viewing need to be amplified. Effective teaching for tomorrow demands teaching strategies in which teachers creatively organize a variety of content which must be taught to a variety of learners with different backgrounds, needs and interests. Compared to traditional methods, multi-sensory integrated strategies make pupils more enthusiastic, thereby more motivated to learn. Gagne's (1985) Conditions of Learning Theory asserts that there are several different types or levels of learning. He identified five major categories of learning: verbal information, intellectual skills, cognitive strategies, motor skills and attitudes. All categories of learning cited by Gagne are included in the Gallery Walk. Gallery Walk technique encourages students out of their chairs and actively involve themselves in the discussion. Tewksbury, et al. (2014) cite that Gallery Walk is cooperative learning strategy. Since it is a cooperative learning because students are formed in groups, they share thoughts in a more intimate and supportive setting. (<http://serc.carleton.edu/introgeo/gallerywalk/what.html>).

Materials and methods:-

The study adopted the quasi-experimental research where participants were match-paired based on the scores in the administered pre-test. One group was taught using gallery walk technique and the other group the traditional method of teaching. The study covered the selected topics scheduled in English subject for two quarters. Three phases were considered for the conduct of the study. The first phase was the development of learning materials, tests, and lesson plans which were submitted to the experts for validation. The second phase was the implementation involving the administration of pre-test to the learners to identify the match-pairs for the two groups. Mean scores of the two groups in the pre-test were subjected to t-test to determine if there was a significant difference in their prior knowledge before the implementation of the study. The analysis revealed that there was no significant difference, therefore there was no bias in the selection of the participants. The same sets of questions and exercises were given covering the same lessons. Quizzes as formative tests were also administered. The third phase of the study was the post-implementation where quarterly (summative) tests and post tests were given to the learners. Significant difference in the performance of learners in these tests was determined using t-test for independent means.

Results and Discussion:-

The table below illustrates the performance of the two groups in the formative tests for the two quarterly periods. For the first quarter a mean difference of 2.88 was obtained in favor of the control group. A computed t-value of 1.72 was not significant at .05 level with 48 degrees of freedom. This accepts the hypothesis that no significant difference exist in their performance during the first quarterly period. However, in the second quarterly period, the computed t-value of 2.83 suggests that there was a significant difference in their performance.

Table 1:-Formative Means of Control and Experimental Groups in the Two Quarterly Periods

Groups		t	df
Control	Experimental		
First Quarterly	76.44	73.56	1.72*
Second Quarterly	72.44	78.32	2.83*48

Note. *=p<.05

In Table 2, the control group garnered a mean score of 18.76 and a standard deviation of 5.38. The experimental group got a mean score of 22.72 with a standard deviation of 5.57. This conveys a mean difference of 3.96 in favor of the learners in the experimental group further suggesting that they performed better than their counterpart. This is affirmed by the computed t-value of 2.56 at .05 level.

Table 2:-Post-test Means of Control and Experimental Groups

Groups		t	df
Control	Experimental		
Post-test	18.7622.722.56*	48	
	(5.38) (5.57)		

Note. *=p<.05

Mean differences of 5.60 and 5.96 in the first and second quarterly periods respectively were both in favor of the experimental group's performance. As shown in Table 3, the computed t-values of 2.79 and 3.88 were significant at .05 level, therefore there was a significant difference between the performance of the two groups. It implies that learners in the experimental group performed better.

Table 3:-Quarterly (Summative) Test Means of the Control and Experimental Groups in the Two Quarterly Periods

Groups		Control	Experimental	t	df
First Quarterly		17.96	23.56	2.79*	48
(4.26)	(8.87)				
Second Quarterly		17.12	23.08	3.88*	48
(4.11)	(6.03)				
Total	35.08	46.84	3.79*	48	
(7.45)	(13.30)				

Note. *=p<.05

The findings revealed significant differences in the mean scores of learners in the two groups. These are evident in the formative tests, summative or quarterly tests and the post tests. Mean differences in scores were in favor of the experimental group taught with gallery walk technique. The analysis suggests that the technique was more effective than the conventional method of teaching. Since gallery walk involves the use of multi-sensory strategies it is an effective means of bringing out the best in the students, hence optimum learning is achieved.

helminths

Abstract

Molecular techniques, such as 16S rRNA sequencing and whole microbial genome sequencing, have revolutionized the standard microbiological practice by disclosing the remarkable diversity, composition and identity of bacterial communities associated with eukaryotes. Here, we outline the development from the single-gene analysis in an ecosystem to the compounded genetic information of the entire ecosystem employing high-throughput sequencing technologies. We also provide the microbial communities associated with eukaryotic organisms, including some parasitic helminths. We hope that the information provided here will be useful to widen our understanding of the techniques in most reasonably equipped molecular biology laboratories, and bacteria associated with eukaryotes, involving parasitic helminths.

The necessities of microbial world:-

Prokaryotes represent the largest proportion of life forms on earth, which comprises 10^6 to 10^8 different genotypes. The largest reservoir for carbon (350–550 Petagrams), nitrogen (85–130 Pg) and phosphorous (9–14 Pg) is the prokaryotic organisms that inhabit our planet [1]. These microorganisms are responsible for most of the chemical cycles on earth, which are essential for our existence. In addition, microorganisms serve human beings by maintaining our health, fermenting food and producing drugs [2]. Most of these microorganisms live in communities; many of those communities are complex with high magnitude of diversity with thousands of interacting members [3] where they will compete for basic needs like space, air, etc. For the better understanding of life, it is essential to understand the diversity of these microorganisms in the community. Most of the research on microorganisms is based on culturing organisms in the laboratory. Major difficulty encountered by researchers in the field of microbial study was, how to study those organisms which do not grow under standard culturing conditions [4]. The term metagenomics was first coined by Handelsman in 1998, for habitat based investigation of mixed microbial population at the DNA level. Metagenomics provides a culture-independent way to access unculturable microorganisms and is now possible to study the genome of all those organisms. Thus metagenomics revolutionized the field of microbiology which offers a window to understand previously unknown and uncultivable microorganisms. Life on earth was flourished due to a transition from the anaerobic to aerobic forms of photosynthetic bacteria. Due to this transition oxygen began to accumulate in the atmosphere until it was sufficient to support the life of aerobic organisms. Once oxygen concentration reached at a very high concentration, oxygen molecule began to collide and produced ozone. Later this ozone gas accumulated in the stratosphere and protected the life forms on earth from ultraviolet light [5]. Yet another group of microorganisms evolved are nitrogen fixers. These bacteria could break triple bonded nitrogen molecule and fix atmospheric nitrogen for the usage of terrestrial living beings. Human health is under constant check by human microbiome such as gut microflora, when the balance of gut microbial community is compromised, many diseases like colon cancer, inflammatory bowel disease, obesity and diabetes may occur. All these microbes coevolved with the human species, produces an intertwined web of dependency and communication. A large proportion of the drugs available today are synthesized from bacteria and fungi. The discovery of antibiotics has transformed human existence by providing an outstanding way for the treatment of infectious diseases. In addition microorganisms play an important role in providing industrial enzymes and polymers, cleaning up toxic waste products and can be employed in the process of fermentation etc. Tabulated below are the differences between cultivable and uncultivable microbes [6]. In the late 1970s, the microbial genome study began with the sequencing of bacteriophage genomes MS2 RNA [7] and QX174 [8]. *Haemophilus influenza* genome was sequenced in 1995 [9].

History and technology evolution:-

There are many examples in the scientific literature of bacterial groups co-existing in the animal and human body. Their composition and activities are thought to be closely involved in shaping our health and have been examined over several years. The classical approach to explore the animal and human microbial community is relied on culturing and isolating a single microorganism, and identifying its physiological, biochemical, ecology, life history and serum reaction index characteristics. Nevertheless, a large proportion of the gut microbiota is uncultured microbes, and it would be logistically laborious to grow the diverse species that can be cultured. With the development of molecular biology and the extensive application of modern technologies, many new genomic approaches have emerged during the past decade for the animal and human microbe investigations. These approaches involve terminal restriction fragment length polymorphism (T-RFLP), PCR based denaturing gradient gel electrophoresis (DGGE), automated ribosomal intergenic spacer analysis, fluorescence in situ hybridization (FISH), and microarray.

Sanger sequencing and next generation sequencing (or high-throughput sequencing):-

Sequencing technology has become the common process in researching the animal microbial community, and metagenomic sequencing has firmly transferred from conventional Sanger sequencing technology to be next-generation sequencing (NGS). The disadvantages of Sanger sequencing are the laborious cloning process, the cloning bias and the expensive cost of a single giga base of data generated. The most conspicuous source of this bias, which produces a low read coverage in these regions, is adenine-thymine (AT) richness. NGS, which eliminate the cloning bias, has entirely altered sequencing efficiency, allowing high-throughput analysis of complex microbiota via the capture of short DNA sequence (amplicons or random fragments) in which a myriad of samples may be multiplexed employing short DNA sequence “bar codes” [10]. This provides adequate sequencing depth in each sample to characterize the top 99.99% of the microbiota, permitting the unravelled micro-organism discovery with no prior knowledge of their sequences. In addition to analyzing the microbial genomics, NGS is also

appropriate for transcriptome sequencing, which determines mRNA quantitatively, enabling new insights into genome expression and how it may be altered in healthy and diseased individuals. The NGS technology holds promise for a contemporary understanding of infectious disease and for diseases not previously known to have a microbial element.

The different sequencing strategies:-

In recent years, various types of sequencing strategies have been applied successfully in a wide range of metagenomic projects that have enormously revolutionized our knowledge of the microbial communities living in and on animal and human bodies. A large and growing body of literature on the microbial community is relied primarily on three kinds of sequencing strategies: amplicon sequencing, shotgun sequencing and transcriptome sequencing, whose cardinal goals are to study microbial communities *in vivo*. The most common application of amplicon sequencing with NGS technology in the microbiome is 16S rRNA gene sequencing, which is usually employed to assess the bacterial general composition. Metagenome shotgun sequencing provides more intricate information of the microbiome, including gene content and its potential functions. Finally, the active members of the microbial community and its functionality can be investigated by transcriptome sequencing.

Amplicon sequencing:-

Complex microbial communities, such as the animal and human gastrointestinal tract (GIT) microbiome, are presently receiving increasing interest, owing basically to technological advances in culture independent approaches in recent years. Nevertheless, in surveys of tremendously diverse ecosystems, the size of clone libraries (typically 100–500 clones each) only allows for identification of the community members that are present in huge abundance [11; 12; 13; 14; 15; 16]. In addition to failing to detect rare members of the ecosystem, these relatively small data sets provide inaccurate estimates when used for computing species richness within an ecosystem. Regardless of the approach used to estimate species richness, the estimates acquired are highly dependent on sample size, and smaller data sets usually result in the miscalculation of species richness [17; 18]. However, it was not until the end of the 1970's that ribosomal ribonucleic acid (rRNA) sequences were observed to provide a key to prokaryotic phylogeny. The pioneering research and view of [19; 20] was approved and taken up by others [21; 22]. The rRNA molecule is universally distributed, functionally homologous across all prokaryotes and has regions that are conserved-thus permitting sequences to be aligned for comparison and thereby fulfilling the criteria of an exceptional chronometer [19]. In contrast to physiological and phenotypic traits, the genetic material is not impacted by culture conditions. The number of differences in nucleotide sequences in a specific gene that are counted, the greater the difference between genes, the more evolutionary separated are the two organisms. The evolutionary distances, taken as a fraction of sequence differences between pairs in a collection of sequences, is employed to assemble phylogenetic trees [23]. Because of the slow rate of evolutionary change of small-subunit rRNA gene sequences, along with ease of extraction and manipulation, they have become the molecule of choice, and form the "gold standard" in the creation of phylogenetic classification strategies. 16S rRNA gene sequence analysis has not only facilitated new insights into the phylogenetic interrelationships of microorganisms but has provided molecular systematists with an immensely powerful means for describing new diversity within any given microbiological environment. The molecular approach has had major repercussions not only in taxonomy but also, for example, microbial ecology. Studies by [22] have demonstrated that microorganisms could be identified directly in their habitats through a combination of rRNA gene cloning and sequencing. The 16S rRNA gene is a constituent of the 30S small subunit of prokaryotic ribosomes. It is approximately 1.5 kb (or 1500 nucleotides) in length (Fig. 19) and is employed for phylogenetic studies [24] as it is extremely conserved between different bacterial and archaeal species [25].

Figure 19:- Nearly 1.5 kb 16S rRNA gene of *E. coli* illustrating the nine variable regions.

The 16S rRNA gene consists of conserved and variable regions (Fig. 18). The variable regions, which are nine different variable 16S rRNA gene regions being flanked by conserved sites in most bacteria [26], allow discrimination between different microorganisms. 16S rRNA gene methods rely on the PCR (polymerase chain reaction) using 'universal' primers targeted at the conserved regions and designed to amplify as wide a range of

different microorganisms as possible [27; 28]. As a result, 16S rRNA gene sequencing has become ubiquitous in microbiology and microbial ecology as an expeditious and precise alternative to phenotypic bacterial identification methods [29]. Currently, the sequencing of 16S rRNA gene variable regions is the most common application of amplicon sequencing on NGS platforms (Fig. 20).

It provides a quantitative description of the bacterial community present in a complex biological mixture, allowing examination of entire communities and the identities of their constituent members. Phylogenetic mapping of rRNA variation was first used to create the three domain of life [30]. The gene conserved nature was subsequently exploited to develop more rapid methods for determining relationships between organisms directly from environmental DNA and RNA extracts [27; 31]. The coupling of 16S rRNA PCR with next-generation sequencing enables the study of a wide range of samples at low cost [32]. There are three benchtop high-throughput sequencing instruments, which are the 454 GS Junior (Roche), MiSeq (Illumina), and Ion Torrent PGM (Life Technologies). They are laser-printer sized and offer modest set-up and running costs. The MiSeq had the highest throughput per run (1.6 Gb/ run, 60 Mb/h) and lowest error rates. The 454 GS Junior generated the longest reads (up to 600 bases) and most contiguous assemblies but had the lowest throughput (70 Mb/run, 9 Mb/h). The Ion Torrent PGM, which runs in 100-bp mode, had the highest throughput (80–100 Mb/h). In contrast to the MiSeq, the Ion Torrent PGM and 454 GS Junior both produced homopolymer-associated indel errors (1.5 and 0.38 errors per 100 bases, respectively) [33]. 16S rRNA data analysis depends on related sequence clustering at a specific level of identity and counting the representative number of each cluster. Similar sequence clusters are known as operational taxonomic units (OTUs). A level of 95% sequence identity is frequently chosen as being representative of a genus and 97% for a species when using partial 16S rRNA gene sequences [34]. Identification accuracy is reliant on the selected reference database. Curated databases, for example the Ribosomal Database Project [35], GreenGenes [36] and SILVA [37], where quality assessment and alignment of MiSeq sequences are manually optimized, are substantial for optimal phylogenetic analysis. There are two common analysis pipelines employing for analyzing 16S rRNA gene sequence data. These are: QIIME [38] and Mothur [39]. Figure 1 and Table 1 present the summary statistic of the community structure, and the commonly employed ecological and NGS term explanation in the microbial community research field. The commonly employed ecological and NGS term explanation in the microbiota research field is illustrated in Figure 21 and Table 3.

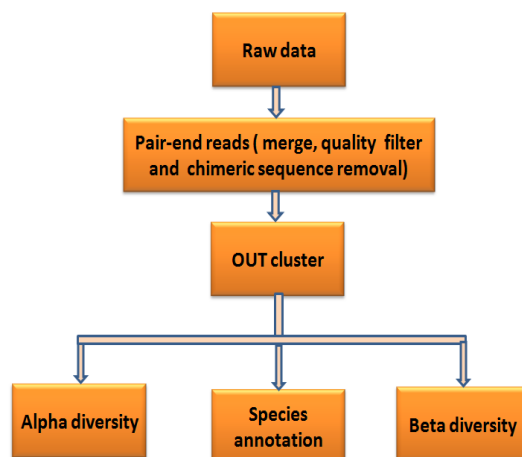

Figure 20:- Flow chart summarizing the 16S ribosomal RNA (rRNA) NGS

Table 3:- The commonly employed ecological and NGS term explanation in the microbiota research field.

Term	Explanation	Reference
Operational taxonomic units (OTUs)	Clusters of 16S/18S small subunit (SSU) rRNA gene similarity, are used as theory-agnostic approximations of microbial taxa	[40]
Microbiome	It literally means small biome, the ecosystem comprising all microorganisms in a particular environment together with their genes and environmental interactions.	[41]
Microbiota or microbial community	The assemblage of microorganisms themselves and can include bacteria, archaea, viruses, phage, fungi and other microbial eukarya.	[41]
Bacterial community	The composition of bacteria living within a particular part of the body.	[42]
Microflora	The community of microorganisms, including bacteria, fungi and algae, which live in a special habitat or in or on another living organism.	[43]
Flora	Referring specifically to plants, rather than microbes	[41]
Bar code	For processing a large number of samples with multiplex sequencing on a high-throughput instrument, individual "barcode" sequences are added to each sample so they can be distinguished and sorted during data analysis.	[41]
Evenness	A measure of the skew in abundance of community members. Is there one dominant organism or are all evenly represented?	[41]
Richness	The number of different types of organism present.	[41]
Diversity	A combination of richness and evenness can be considered to be a summary statistic for community structure.	[41]
Simpson index	A common diversity index indicating the probability that two individuals taken at random from a population are the same. Often presented as the inverse so that increasing diversity is mirrored by an increasing index value.	[41]
Shannon index	Alternatively, Shannon entropy-another common diversity index that quantifies the uncertainty of predicting the next individual taken from a sample.	[41]
Alpha diversity	Within sample diversity.	[44]
Beta diversity	Between sample diversity.	[44]

Figure 21:- A diagram describing species richness and evenness and how they characterize the community composition. Each shape represents an individual and the color and nature of the shape represents a different type of organism. Increased numbers of diverse types of organism is characterized as augmented species richness. The community is described as even, when no one organism is dominant.

Factors affecting gastrointestinal tract (GIT) microbiota:-

The ruminant gut microbiota is crucial in shaping several of its host's functional attributes. The bovine rumen microbiota is necessary for the proper physiological development of the rumen and for the animal's ability to digest and convert plant mass into food products, making it highly significant to animals. Factors affecting gastrointestinal tract (GIT) microbiota composition and activity in ruminants are presented in Figure 21. The bacterial profiles of the rumen microflora is known to be highly responsive to changes in diet, age, antibiotic use and health of the host animal and varies according to geographical location, season and feeding regimen (feed and feed additives) [45; 46; 47; 48; 49; 50]. Additionally, it has been reported that the host gut microbiota varies across species and individuals; however, it is relatively constant over time within an individual [51]. However, it has been reported that the detectable bacterial structure in the rumen is remarkably conserved among diverse locations and over time, while the quantity of individual bacterial species may alter diurnally in response to the feeding regimen [29]. The diversity and within-group similarity augmented with age, suggesting a more diverse but homogeneous and specific mature community, compared with the more heterogeneous and less diverse primary community. In addition, the establishment of this microbial population and the alterations occurring with the host's age was observed [52]. The composition of the intestinal microbiota can be modulated as a result of dietary exposure (ovine milk, formulas) as well as of intentional diet supplementations (prebiotics or probiotics). Rumen microbial community composition of cattle, bison, and buffalo (bovines), sheep and goats (caprids), deer (cervids), and alpacas, llamas, and guanacos (camelids), including diverse breeds of domestic cattle, sheep, and goats varies with diet and host [53]. It is well-established that the microbial community structure and composition is affected by diet [54]. The feeding operation is a more essential determinant of the bovine microbiome than is the geographic location of the feedlot [55]. Probiotics/prebiotics have the ability to modulate the balance and activities of the GI microbial ecosystem in ruminants [56]. Host genotype is among the factors that influence the microbial composition of the gut [57; 58]. Some authors studied the similarity degree in the predominant faecal microflora of identical twin pairs, fraternal twin pairs, and unrelated controls; the highest levels of similarity were observed in genetically identical twins [59]. Some authors studied the development of rumen microbial populations in young calves and lambs [60; 61]. The diversity indices of bacterial 16S rDNA and the change in soil bacterial community composition increased under intensive grazing [62]. A growing body of evidence shows that parasitic infections are associated with the alterations of porcine proximal colon microbiota at 21-days of infection with *Trichuris suis* [63], and the changes in the caprine abomasal microbial composition induced by *H. contortus* at 50-days infection [64]. Interactions among helminth parasites, bacterial microbiota, and host immunity have been reviewed in detail elsewhere [65; 66; 67] (Fig. 22).

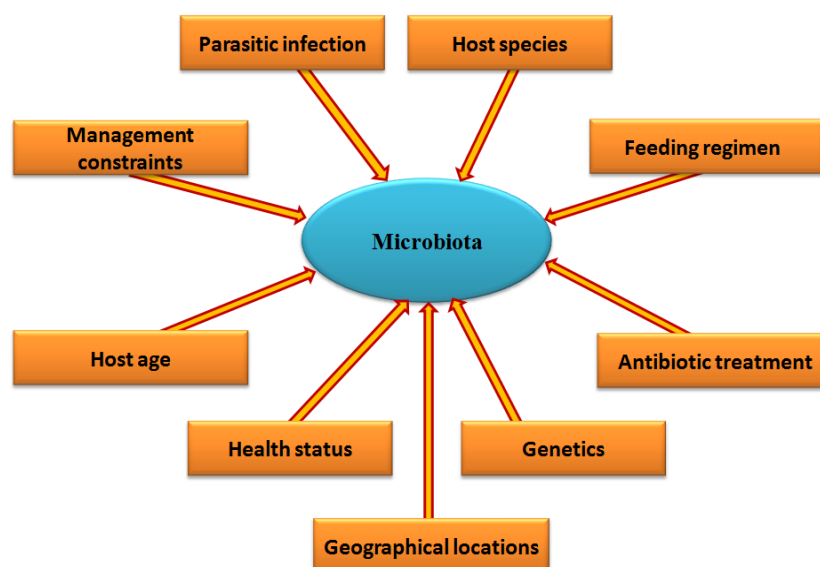

Figure 22:- Factors influencing the development and composition of microbiota in ruminants.

Microbial community associated with eukaryotes:-

A microbiota is an ecological community of symbiotic microorganisms found in and on all multicellular organisms. The synonymous term microbiome literally means small biome, the ecosystem including all microorganisms in a particular environment together with their genes and environmental interactions. The assemblage of microorganisms themselves is referred to as the microbiota or microbial community and can involve bacteria, archaea, viruses, phage, fungi and other microbial eukarya [68; 69]. Microflora can also be existed as a general term in the literature; nevertheless, flora refers particularly to plants, rather than microbes. The animal microbiota consists of microorganisms that exist upon, within or in close proximity to the animal body. Bacteria live in a wide variety of environments and have evolved close relationships with invertebrates, vertebrates, plants, and even with other bacteria [70; 71; 72]. The interaction between host organisms and prokaryotic microbes can range from pathogenic to mutually beneficial [71]. Symbiosis is an intimate interaction between two different biological species [73]. Such associations involve a variety of more specific relationships: parasitism (The symbiont benefits and the host is harmed), commensalism (the symbiont benefits and the host is unaffected), and mutualism (both the host and the symbiont benefit). It can be categorized according to their location in the host as either ectosymbionts (living on the surface) or endosymbionts (residing within host tissues). The latter can further be classified as primary, obligate *P*-endosymbionts (vital for host survival), or secondary, facultative *S*-symbionts (not necessary for host survival). Some *P*-endosymbionts reside in particular host structures or organs called bacteriomes; however, others are more extensively distributed in host tissues [74; 75]. The symbiosis continuation through host generations depends on symbiont transmission. Horizontally transmitted symbionts are recently taken up from the environment by each host generation, and vertically transmitted symbionts are frequently transferred through the female germ line. Mixed mode of transmission also exist [76]. For horizontally transmitted bacteria, symbiotic life is facultative: a free-living population serves as the inoculum for the symbiosis. Such free-living populations occur in soil [77], marine shallow waters and the deep sea [78]. In some cases the free-living population is restored by symbiont release from the host [79]. Vertical transmission frequently involves no aposymbiotic phase and transmission through the female germ line, even though there may be acquiring during mating. Moreover, there are unusual ways of maternal transmission, as in the stinkbug (*Megacopta punctatissima*), which harbor extracellular symbiotic gammaproteobacteria in the midgut cavity [80]. These bacteria are deposited with the eggs on plants in “symbiont capsules”, are eaten by the newly developing nymphs and colonize the insect midgut [81].

Symbiotic bacteria:-

A variety of microbes colonize invertebrate and vertebrate mucosal surfaces, including digestive, respiratory, and reproductive tracts [82].

Gut symbionts:-**Invertebrate-microbe associations:-**

The life cycle of five invertebrate-microbe interactions has been reviewed by [83]. In each of the symbioses demonstrated below, the animal acquires a specific symbiont (or symbionts), which colonizes the host in a specific location: a) the squid obtains its symbionts (e.g. *Vibrio*) from sea-water populations, which colonize the nascent light organ; b) the nematode brings its symbiont (e.g. *Xenorhabdus-Photorhabdus* and nematode worms) into the insect host (e.g. *Drosophila*), where both proliferate. The bacteria then recolonize the nematodes, which escape from the carcass; c) juvenile leeches obtain symbionts (*Aeromonas*, *Rikenella* and the leech) after hatching from their cocoon (perhaps from the cocoon itself). They then take up residence in the crop, where they digest their blood meal; d) the tsetse fly (*Sodalis glossinidius* and the tsetse fly) can either pass the symbionts maternally to the eggs or pick up new strains from the environment; e) specific symbionts on the food of the fruit fly colonize and persist in the enteric tract (i.e. *Enterococcus* and the fruit fly) (Fig. 23).

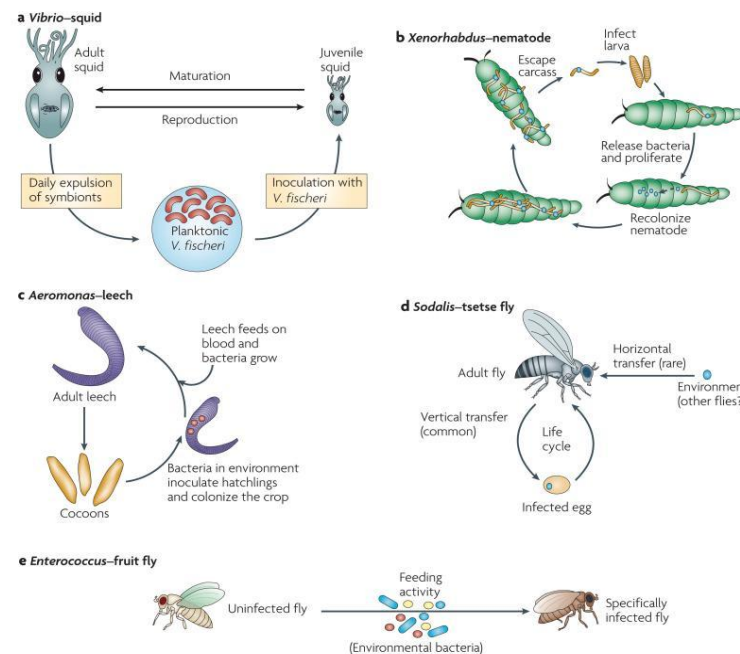

Figure 23:- Simplified life cycles of five symbioses (adapted from [83])

Nematode-microbe associations:-

Little is recognized about the symbiotic gut bacteria of nematodes and their role in host nutrition; however, there are ectosymbiotic microbes of marine nematodes known to supply nutrients to their hosts [84]. While abomasal nematodes are exposed to the abomasal and ruminal microbiota, the nematode gut symbionts may reflect the external microorganisms, which continually pass through their guts.

Rumen-microbe associations:-

The rumen microbes involve many species of bacteria, protozoa, fungi, and archaea, and are dominated by bacteria. These microbes are crucial for the fermentation, digestion, and conversion of indigestible foods and mucus into short-chain fatty acids and microbial protein [85; 86]. The rumen microbiota starts establishing in the lamb rumen soon after birth, before the rumen is functional. In the rumen of lambs, rigorous anaerobic bacteria prevail as early as 2 days of age. Cellulolytic bacteria emerge around the fourth day. Protozoa become established later (2 wk) and their populations have maintained by 4 mo [87]. In field-raised lambs, individual bacteria sequentially colonize the rumen: strict anaerobes prevail at day 2, from day 2 to 10, the strict aerobes and facultative anaerobes are 10 to 100-fold lower than the anaerobes and continue to decrease thereafter; methanogens and cellulolytic bacteria appear by day 3 and reach adult levels by the end of the first week [88]. The prevailing bacterial species in the immature rumen belong to *Bacteroides*, *Propionibacterium*, *Clostridium*, *Propionibacterium*, *clostridium*, *Peptostreptococcus* and *Bifidobacterium* [60], while in adult sheep and goats, the dominant species belong to the genus *Bacteroides* and the phylum *Firmicutes*, including *Clostridium* and *Prevotella* [89; 90]. The rumen bacterial population has been found to be predominantly composed of two phyla: *Firmicutes* (54%) and *Bacteroidetes* (40%) [91]. Similarly, it has

been reported that the rumen bacterial sequences are assigned to 19 phyla, with the dominance of *Firmicutes*, *Bacteroidetes*, and *Proteobacteria* [92].

Human gut microbes:-

The total population of human gut microbes (10^{14}) exceeds the body somatic and germ cells (10^{13}). The microbial density increases from mouth to the large intestine, with nearly 70% of gut microbes colonizing the colon [1]. The gut is antiseptic at birth, colonization starts immediately after the contact with the mother, and the bacterial number and diversity of the gut flora increases during postnatal development [93]. The microbial population is determined by the delivery mode (vaginal versus caesarean), diet, age, host genetics (lean versus obese), country of birth (developing world [Pakistan] versus developed world [Sweden]) [94; 95].

Bacterial enumeration and molecular analysis of human gut samples have shown that the gut microbiota is comprised of approximately 35,000 bacterial species belonging to at least 50 phyla [96]. The gut microbiota are dominated by members of phyla Firmicutes and Bacteroidetes, and there are relatively small proportions of Proteobacteria, Verucomicrobia, Actinobacteria, Fusobacteria, and Cyanobacteria [97]. The bacterial diversity in the gut lumen is different from the bacterial population attached to the mucus layer, and closely associated with the epithelium [98]. Aside from fermenting indigestible foods and mucus into valuable nutrients for the host, gut microbial community is crucial to the host in diverse ways, including the contribution to the immune system development and homeostasis, epithelial cell proliferation and differentiation, and protection against pathogens [99; 100].

Ecdysozoa microbial community:-

Ecdysozoa is a group of protostome animals, including Arthropoda, and Nematoda [101]. Even though arthropods and nematodes are morphologically different, they have several similar features in their endocrinology and physiology, including molting during development. Bacteria, archaea, and eukaryota, are the gut microbes of insects [102]. Related insect groups tend to share relevant species of symbionts, for example most aphids have primary endosymbionts of the genus *Buchnera* [103] and tsetse flies harbor *Wigglesworthia* in particular cells known as bacteriocytes or mycetocytes [104]. When the gut is simple tube or there is a high-throughput of digesta, the microbial diversity is low [105].

Insect gut microbes:-

The gut bacteria provide essential nutrients for the host, as well as particular enzymes [106], for example cellulase in the termite [107]. The microbial population in the insect hind guts changes with diet [108]. In this context, the bacterial community of wild ground beetles and field-caught *Anopheles stephensi* mosquito larvae are more diversified than those of laboratory-reared beetles and mosquito larvae, respectively [109; 110]. Bacterial community related to *Erwinia herbicola* and *Pantoea agglomerans*, which are ectoparasites of several plants, has been identified in pea aphid excreta cultured on nutritional agar [111]. Obligate and facultative anaerobes are the predominant hindgut microflora of cockroaches and termites [112; 113].

The denaturing gradient gel electrophoresis (DGGE) fingerprinting techniques and visualization with fluorescence *in situ* hybridization (FISH) have been employed to illustrate the microbial diversity associated with insects. Phyla, including Firmicutes and Bacteroidetes are the predominant. Similarly, the gut microbial population identified in ground beetles includes Bacilli, Fusobacteria, Gammaproteobacteria, Alphaproteobacteria, Clostridia, and Bacteroidetes, of which Bacilli and Gammaproteobacteria were dominant in wild and laboratory-raised beetles, respectively [114]. The gut bacterial community of the mosquitoes *A. aegypti* and *A. albopictus* included Actinobacter, Pseudomonas, Asaia, uncultured Gammaproteobacteria [110].

Microbial manipulators of reproduction:-

The best studied endosymbiont microbe that changes the host reproduction in arthropods is *Wolbachia pipientis*, which exploits the host insect to disseminate their progeny [115]. Gut bacteria of fruit fly *Drosophila melanogaster* impacts host mating preferences through pheromone synthesis [116]. Symbiotic *Spiroplasma* protects female *Drosophila hydei* from parasitic wasp attack [117]. Reproductive endosymbionts, including *Wolbachia*, *Rickettsia*, *Arsenophonus*, *Cardinium*, and *Flavobacterium*, which are maternally transmitted, are common among insects. They manipulate host reproduction to facilitate their transmission in diverse ways, such as parthenogenesis induction, feminization, and male killing [118; 119; 120; 121]. *Wolbachia* were early identified microscopically as Rickettsia in insect and arachnid tissues, involving eggs in 1920s [122]. From then on, strains of *Wolbachia pipientis* have been

known as important symbionts of filarial nematodes, while a variety of effects on insect reproduction are associated with the symbiotic *Wolbachia pipientis* strains of insects [123].

Microbial manipulators of host fitness:-

Symbiotic bacteria trigger the host immunity resulting in the regulation of the symbiotic population [124; 125]. Endosymbionts (*Regiella insectocola*) of aphids provide protection to their host against the fungal pathogen *Pandora neoaphidis* [126]. Similarly, the facultative symbionts *Serratia symbiotica* and *Hamiltonella defense* protect the host pea aphid from parasitic infection by *Aphidius ervi* and *Aphidius eadyi* [127; 128]. Symbiotic strategies include competition with the invaders for resources inside the host, synthesis of toxic chemical to assist host defenses, and augmentation of host heat tolerance [129; 130; 131; 132].

Bacteria associated with nematodes:-

Free-living terrestrial nematodes:-

Studies of the interactions of soil nematodes with bacteria have mainly focused on bacteria as a food source [133; 134], model for host-pathogen interactions, and possible nematode biocontrol strategy [135; 136]. Symbiotic bacteria, including Alphaproteobacteria, Gammaproteobacteria dominated in the soil nematode bacterial profiles with absence or very low presence of Actinobacteria [137; 138].

Free-living marine nematodes:-

A number of authors have studied the associations between sulphur-oxidizing, chemoautotrophic bacteria with marine nematodes. The nematode parasites provide oxygen and sulphide to the symbiont, which in turn provide food for the host [139; 140]. The cuticle of Stilbonematinae and Desmodoridae harbors sulphur-oxidizing ectosymbionts, which are a source of food for the nematode [84; 86]. The ectosymbiont microbes may be predominated by *Laxus oneistus* and *Robbea* sp. [141].

Entomopathogenic nematodes:-

Entomopathogenic nematodes (EPN) are lethal insect parasitoids, which have been employed effectively for the biological control of lepidopteran, dipteran, and coleopteran pests [142]. The symbiotic bacteria of *Photorhabdus* and *Xenorhabdus* of nematode families Steinernematidae and Heterorhabditidae, respectively are pathogenic in insect hosts and mutualistic in the nematode [143; 144]. These bacteria secrete toxins that are not only toxic to a range of insects, but also to other plant parasitic nematodes, indicating their roles for parasite biocontrol [145].

Mammalian nematodes:-

Wolbachia in filarial:-

Symbiotic *Wolbachia* have been observed in the majority of filarial nematode species, involving the human parasites *Brugia malayi*, *Onchocerca volvulus*, *Wuchereria bancrofti* and *Mansonella ozzardi* [146][146]¹⁴⁶[145][145][145][356], the dog heart worm *Dirofilaria immitis* [147], and the bovine parasite *Onchocerca ochengi* [148]. They are obligate mutualistic endosymbionts, which are essential for worm embryogenesis, development and adult survival, and essential nutrients to the nematodes [149; 150; 151]. Antibiotic therapy has confirmed beneficial in treating human and animal filarial infections and doxycycline treatment is now extensively recommended in endemic areas [150; 152; 153].

Ascaris suum:-

The facultative anaerobic from the intestine of *Ascaris suum*, including *Escherichia*, *Enterobacter*, *Klebsiella*, *Actinobacter*, *Citrobacter*, *Pseudomonas*, *Aeromonas*, and *Shigella* contribute to the possible serotonin synthesis [154; 155; 156].

Heligmosomoides polygyrus:-

The effects of L₃ larvae and adult worms of *Heligmosomoides polygyrus* on the ileum and caecal bacterial population were investigated, and the adult worm bacterial profiles were similar to those in the infected ileum with the bulk of bacterial species belonging to the phylum Firmicutes. However, the L₃ larval-stage profiles were different from the aforementioned two profiles and composed mainly of phylum Proteobacteria [157].

Trichuris muris:-

The literature has emphasized the necessity of host gut bacteria for the development of GIN parasites. By reducing the bacterial number in the mouse intestine using antibiotic treatment, the number of hatched *T. muris* eggs was

substantially diminished [158]. Several species are known to be affected by the germ-free status of the host include *Nippostrongylus brasiliensis* [159], *H. polygyrus* [160], *Trichinella spirallis* [161].

***Haemonchus contortus*:-**

Few studies designed to identify bacteria naturally associated with GIN parasites of sheep. L₃ obtained by *in vitro* culture of faeces collected from animals infected with *O. ostertagi*, *Cooperia onchophora*, and *H. contortus* was exploited to identify the bacterial profiles associated with these parasites. The bacterial species identified *Sphingobacterium multivorum* (opportunistic pathogen) and *Streptococcus macacae* (commensal bacterium). The fundamental focus of previous studies on the bacterial interactions with *H. contortus* has not been on symbiotic bacteria, but rather on potential pathogens, such as the soil bacterium *Bacillus thuringiensis*, which could be exploited to control the GIN parasites. The toxic *B. thuringiensis* are commonly employed in the insect biocontrol [162; 163; 164]. More recent attention has focused on the establishment of the molecular identity of abomasal bacteria associated with genetic resistance and susceptibility to *H. contortus* infection in sheep. The observed bacterial phyla with marked differences between resistant or susceptible sheep were Firmicutes (61.4% and 37.2%, respectively), Proteobacteria (10.2% and 37.2%, respectively), Bacteroidetes (12.8% and 5.8%, respectively), and unclassified bacteria (12.8% and 17%, respectively) [165]. It has been demonstrated that PCR-DGGE short sequences and clone libraries from three stages of *Haemonchus contortus* life cycle (eggs, L₃s, and adults) contained sequences belonging to *Weissella*, *Lactococcus*, *Leuconostoc* and *Streptococcus* [166]. More recent attention has focused on the haemonchine microbiome [167]. The dominant bacterial genera belonged to *Escherichia-Shigella*, *Pseudomonas* and *Ochrobactrum*, which were shared in all the stages of the parasite life-cycle using V3-V4 and V5-V7 amplicons. Moreover, the parasite microbiome could reflect the external micro-organisms (i.e. micro- and macro-habitats).

Conclusion and future directions:-

We have attempted to provide an overview about the high-throughput sequencing and bacteria associated with eukaryotes including parasitic helminths. There is abundant room for further progress in comparing microbiome of different parasitic helminths, which has, and will continue to offer an important parallel goal for the removal of a wide-variety of devastating animal and human diseases.

Acknowledgments:-

This research was supported by the National Key Basic Research Program (973 program) of China (Grant No. 2015CB150300). Additionally, the funders had no role in study design, data collection and analysis, decision to publish, or preparation of the manuscript.

Competing interests:-

The authors declare that they have no competing interests.

Abstract

Oxo tetra aza macrocyclic transition metal complexes $[M(C_{15}H_{25}N_5O)Cl_2]$ or $[M(C_{16}H_{27}N_5O)Cl_2]$; M= Co(II), Ni(II), Cu(II) and Zn(II) have been synthesized by the template condensation reaction of O-amino benzoic acid, triethylene tetramine, and 1,3-dibromo propane or dibromo methane in methanol medium. All the complexes have been characterized on the basis of elemental analysis, IR, NMR, EPR, UV-vis, conductivity and magnetic moment data. All the complexes are non ionic in nature and exhibit an octahedral geometry.

Introduction:-

The pioneering work on metal template synthesis by Curtis⁽¹⁾ and Busch⁽²⁾ exposed the field of macrocyclic chemistry as the major area of research interest. Polyamide macrocycles are of particular interest in view of their two possible donor sites, nitrogen and oxygen atoms. Further more, many of polyamide macrocyclic complexes function like porphyrins in catalyzing organic oxidation reactions⁽³⁻⁸⁾. Amide macrocycles bear the dual structural features of macrocyclic tetra amines and oligopeptides and can stabilize higher oxidation states of some of the metal ions^(9,10). Some of these compounds have been used as metal ion carriers^(11,12). Transition metal(II) complexes of amide macrocycles have interesting properties and can be considered as models for metalloproteins and oxygen carriers^(13,14). The present work describes the synthesis and characterization of a new series of oxotetraamine macrocyclic complexes obtained by the template reaction of o-aminobenzoic acid, triethylene tetramine and dibromo propane.

Material and methods

o-Amino benzoic acid, 1,3-diamino propane, diamino ethane and triethylene- tetra amine (all E. Merck were used as purchased. The metal salts were AR grade reagents obtained from BDH.

Preparation of dichloro (3-oxo-1,2-benzo-4,7,10,13-16 penta aza cyclo-hexadecane) metal(II) $[ML^1 Cl_2]$ [M = Co^{II}, Ni^{II}, Cu^{II} and Zn^{II}]

To a methanolic solution of metal salt (0.01 mol) were added simultaneously triethylenetetra amine (0.01 mol) and o-aminobenzoic acid (0.01 mol) through the each neck of a two-necked round bottom flask. The resultant mixture was stirred for about 7 hrs and then dibromo ethane was added. The stirring was continued for another 3 hrs which resulted in the formation of the title compounds. The title compounds were isolated by filtration, washed several times with methanol and then with Et₂O and dried in vacuo. The purity of the final products was confirmed by TLC as follows: The complexes were dissolved in DMF using EtOAc (80%) MeOH (15%) and MeCO₂H as eluent. A single spot was seen in each case on developing in an iodine chamber.

Preparation of dichloro (3-oxo-1,2-benzo-4,7,10,13,17 pentaazacyclohepta) decane metal(II), $[ML^2 Cl_2]$ [M = Co^{II}, Ni^{II}, Cu^{II} and Zn^{II}]

The procedure used for these compounds was similar to the above method except that 1,3-dibromo propane was added instead of dibromo ethane in the final step.^(15,16)

Results and Discussion:-

The template condensation reaction of triethylene tetraamine, o-aminobenzoic acid and dibromo alkane resulted in the formation of macrocyclic complexes as shown in Scheme I. All these compounds were obtained as polycrystalline solids. They are freely soluble in dimethyl sulphoxide, dimethylformamide and acetonitrile. The results of elemental analysis are consistent with their proposed 1:1 (metal to ligand) stoichiometry. All the complexes exhibited low molar conductivity values in DMSO ($13\text{--}20\text{ ohm}^{-1}\text{ cm}^2\text{ mol}^{-1}$) which support⁽¹⁷⁾ the non-ionic nature of these compounds.

IR-Studies:-

The IR spectra of all the complexes exhibited a single sharp band in the region $3250\text{--}3270\text{ cm}^{-1}$ which may be assigned to coordinated NH stretching vibration. This information together with the appearance of four bands in the ranges $1680\text{--}1710$, $1530\text{--}1570$, $1250\text{--}1260$ and $650\text{--}670$.

cm^{-1} assignable⁽¹⁸⁾ to amide I ($\nu\text{C=O}$); amide II ($\nu\text{C-N} + \delta\text{NH}$), amide III (δNH) and amide IV ($\phi\text{C=O}$) bands respectively, suggests the formation of the proposed macrocyclic framework. The absorption bands appearing in the region $2880\text{--}2930$ and $1410\text{--}1460\text{ cm}^{-1}$ in all the ligands may reasonably be assigned to the CH stretching and CH bending vibrational modes, respectively. The appearance of a low medium intensity band in the region $410\text{--}450\text{ cm}^{-1}$ assignable to $\nu(\text{M-N})$ further confirms the involvement of nitrogen in coordination. However, no complex gave bands assignable to primary amines or carboxylic acid groups.

NMR-Studies:-

The ^1H NMR spectra of zinc macrocyclic complexes showed a multiplet, in the region 8.41–8.56 ppm which can be assigned⁽¹⁹⁾ to amide (NH–CO) protons. This clearly shows that the condensation of o-aminobenzoic acid and triethylene tetraamine, has indeed taken place. A multiplet appearing in the region 3.35–3.61 ppm may be ascribed to the methylene protons (CO–N–CH₂). The complexes showed a multiplet in the region 6.98–7.26 ppm corresponding to the phenyl ring protons. Another multiplet observed for all the complexes in the region 2.58–2.60 ppm may be assigned to the methylene proton between the nitrogen atoms (–CH₂–N). The spectra of all the complexes showed multiplet in the region 6.21–6.40 ppm which corresponds⁽²⁰⁾ to the secondary amino protons (C–NH). No compound exhibited signal corresponding to the carboxylic or secondary amino protons, which supports the proposed structure shown in Scheme 1.

EPR-Studies:-

The EPR spectra of polycrystalline copper(II) macrocyclic complexes at room temperature show a single band with g_{\parallel} and g_{\perp} values 2.24, 2.30 and 2.13, 2.09 respectively. None of the complexes exhibited hyperfine splitting which may be due to the fact that the paramagnetic centres are not diluted. The existence of $g_{\parallel} > g_{\perp}$ values 2.24, 2.30 and 2.13, 2.09 respectively. None of the complex exhibited hyperfine splitting which may be due to the fact that the paramagnetic centres are not diluted. The existence of $g_{\parallel} > g_{\perp}$ suggests⁽²¹⁾ that dx^2-y^2 is the ground state. The g values are related to the axial symmetry parameters, G by the following expression, $G = (g_{\parallel} - 2)/(g_{\perp} - 2)$. The G values measure the extent of exchange interaction between copper centres in the polycrystalline solid. If $G > 4$, exchange interaction is negligible, and if $G < 4$, considerable exchange interaction exists in the solid complexes⁽²²⁾. In the present case, G values were found to be 1.85 and 3.33.

Electronic Spectral Studies:-

The electronic spectra of cobalt complexes exhibited two ligand field bands in the ranges 13800–14000 and 22200–22300 cm^{-1} which are assignable^(23,24) to ${}^4\text{T}_{1g}(\text{F}) \rightarrow {}^4\text{A}_{2g}(\text{F})$ and ${}^4\text{T}_{1g}(\text{F}) \rightarrow {}^4\text{T}_{1g}(\text{P})$ transitions respectively in an octahedral geometry⁽²⁵⁾. The appearance of two bands in the electronic spectra of nickel complexes in the ranges 11550–11600 and 17500–17650 cm^{-1} may be assigned⁽²⁵⁾ to ${}^3\text{A}_{2g}(\text{F}) \rightarrow {}^3\text{T}_{1g}(\text{F})$ and ${}^3\text{A}_{2g}(\text{F}) \rightarrow {}^3\text{T}_{1g}(\text{P})$ transitions, respectively suggesting an octahedral geometry for Ni^{2+} complexes. The electronic spectra of copper complexes exhibited two well-discernible bands in the ranges 16400–16700 and 18800–19100 cm^{-1} assignable^(26–28) to ${}^2\text{B}_{1g} \rightarrow {}^2\text{B}_{2g}$ and ${}^2\text{B}_{1g} \rightarrow {}^2\text{E}_{2g}$ transitions, respectively which are characteristic of an octahedral geometry. The high intensity bands observed around 37000 cm^{-1} for all the complexes in the ultraviolet region of the spectra may be assigned as metal to ligand charge transfer transitions. The magnetic moment data (Table 1) for all the complexes are consistent with the high spin octahedral geometry around these metal ions which further supports the electronic spectral results.^(29–31)

Composite index, Development indicators, Model districts, Potential targets.

Abstract

The level of industrial development across different districts of the state has been worked out with the help of composite indices. The composite indicators are obtained with the help of two different methods. The district-wise data in respect of forty three indicators are used for twenty three districts of the State. The data on most of the indicators are for the year 2013-2014. Ranks of the districts in the level of industrial development are obtained from both the methods, which are later compared. It is observed that there is no significant difference between the ranks obtained from the two methods used. The study has brought out the huge disparities that exist among the districts which have accentuated over a period of time. The district Kamrup is ranked first and the district Hailakandi is ranked last. For bringing out uniform regional development, potential targets have been estimated for low developed districts. These districts require improvements of various dimensions in some of the indicators for enhancing the level of overall socio-economic development.

Introduction:-

The problem of inter-district disparity in the levels of development is not of recent origin and is almost universal. Its extent may differ in different economics but its existence can hardly be challenged. Economic development is a concern of all societies as well as the nations. During the course of economic development, the determinants of developmental process shape up in the form of agrarian transformation towards non-agricultural sectors. Also, at some stage of economic development, increasing urbanization, improved quality of infrastructure, increased standard of living of human beings and the improved quality of overall governance take place. However, in this process of development, some regions of the economy grow faster whereas others tend to lag behind.

Assam had a great legacy of modern industrial development. Along with tea, oil refineries and coal mines were developed post-independence. A number of major industries based on the rich mineral and forest resources were set up under the central public sector. Fertilizer industry, Namrup; Cement factory, Bokajan and Paper mill at Jagiroad etc. were also set up. Assam produces three unique varieties of silk; the golden muga, the white pat and warm eri. Sericulture is one of the biggest contributors of state income. It is practiced in more than 9373 villages and provides employment to 2.4 lakh families. Eri contributes Rs 31.5 crores where as muga contributes Rs 40 crores and pat silk contributes Rs 120 crores out of total Rs 190 crores generated annually through the silk industry in Assam. The Assam Handloom Industry is known for its tradition of making handloom and handicraft products. At present, 11570 villages of the state with 1319754 weavers are covered by the directorate of Handloom and Textiles for its

handloom activities. The Small Scale Industrial (SSI) Sector is a vital constituent of the total industrial sector. Electricity, good roads and transport system are the key indicators of development in a region. A better transport system increase income, employment opportunities, tourism, and industrial development in many ways. But there are differences in all the districts of the State as far as industrial growth is concerned. All the districts of the State are not equally developed. So, we have made an attempt to throw light on the developmental disparities in industrial growth for twenty three districts of the State. Development is a process which improves the quality of life. Its impact cannot be fully captured by a single indicator. Hence there is need for building up of a composite index of development, combined in an optimum manner. A deep analysis using the district level data on socio-economic indicators was made by Narain et. al. for the States Orissa [1992-1993], Andhra Pradesh [1994], Kerala [1994] Uttar Pradesh, [1995] Maharashtra [1996], Karnataka [1997], Tamil Nadu [2000], Madhya Pradesh [2002]. Similar study had been made by Borah and Nath for Assam [2004, 2010]. In all, the study for evaluating the level of socio-economic development was conducted in two hundred twenty eight districts belonging to the states of Andhra Pradesh, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Tamil Nadu and Uttar Pradesh and it was found that 73 districts were low developed which require special attention for undertaking future developmental programmes.

Methods of Analysis:-

Development is a multi-dimensional continuous process. For this study, the districts have been taken as the unit of analysis. Twenty three districts of the state of Assam are included in the study. Two methods have been separately used to rank the districts of the state, viz. Narain et. al. method and Michela et. al. method.

Narain Et. Al. Method:-

Let a set of n points represent districts $1, 2, \dots, n$ for a group of indicators $1, 2, \dots, k$, which can be represented by a matrix (X_{ij}) ; $i = 1, 2, \dots, n$ and $j = 1, 2, \dots, k$. As the developmental indicators included in the analysis are in different units of measurement and since our objective is to arrive at a single composite index relating to the dimension in question. There is a need for standardized as shown below [Narain et. al., 1991]:

$$Z_{ij} = \frac{X_{ij} - \bar{X}_j}{S_j},$$

$$S_j^2 = \frac{\sum_{i=1}^n (X_{ij} - \bar{X}_j)^2}{n}$$

and

$$\bar{X}_j = \sum_{i=1}^n \frac{X_{ij}}{n} \quad (i=1,2,\dots,n), \quad (j=1,2,\dots,k)$$

Let $[Z_{ij}]$ denote the matrix of standardized indicators. The best district for each indicator (with maximum/minimum standardized value depending upon the direction of the indicator) is identified and from this the deviations of the value for each district has been taken for all indicators in the following manner:

$$C_i = \left(\sum_{j=1}^k (Z_{ij} - Z_{0j})^2 \right)^{1/2},$$

where Z_{0j} the standardized value of the j th indicator of the best district and C_i denotes the pattern of development of i^{th} district.

The pattern of development is useful in identifying the districts which serve as 'models' and it also helps in fixing the potential target of each indicator for a given district. In this study, the composite index of development is obtained through the following formula:

$$D_i = \frac{C_i}{C},$$

$$C = \bar{C} + 2S$$

$$\text{where } \bar{C} = \sum_{i=1}^n \frac{C_i}{n}$$

$$S = \left(\sum_{i=1}^n \frac{(C_i - \bar{C})^2}{n} \right)^{1/2}$$

and

“ D_i ” gives the composite index of development with which ranking of the districts is done.

Michela Et. Al Method:-

Theoretical frame work and methodology is followed from [14]. The aggregated values give the composite index of development to rank the districts. A theoretical framework should be developed to provide the basis for the selection and combination of single indicators into a meaningful composite index. The indicators should be selected on the basis of their analytical soundness, measurability, country coverage, relevance to the phenomenon being measured and relationship to each other. The use of proxy variables should be considered when data are scarce.

A multivariate analysis should be done to investigate the overall structure of the indicators, assess the suitability of the data set and explain the methodological choices. The next step is normalization in which the indicators should be normalized to render them comparable.

$$Z_{ij} = \frac{X_{ij} - \bar{X}_j}{S_j}$$

A correlation study is done to find the redundancy in the indicators, and the correlation co-efficient is given by:

$$r_{z_i, z_j} = \frac{\sum (z_i - \bar{z}_i)(z_j - \bar{z}_j)}{\sqrt{\sum (z_i - \bar{z}_i)^2} \sqrt{\sum (z_j - \bar{z}_j)^2}}$$

We discard the indicators having high correlation co-efficient with other indicators and as such the number of indicators reduces.

Finally weighting and aggregation is done in which the indicators should be aggregated and weighted according to the underlying theoretical framework.

$$A_i = \sum_j z_{ij}$$

The aggregated values give the composite index of development to rank the districts.

Relative Share of Area and Population under Different Level of Development:-

A simple ranking of district on the basis of composite indices is sufficient but a suitable classification of districts formed on the basis of mean and standard deviation of the composite indices will provide a more meaningful characterization of various stages of development. For relative comparison it appears appropriate to assume the districts having composite index less than or equal to (Mean - SD) as highly developed districts. And the districts having composite index greater than or equal to (Mean + SD) be low developed districts. Similarly districts with composite index lying between (Mean and Mean - SD) are classified as middle level developed and district with composite index lying between (Mean and Mean + SD) are classified as developing districts.

Fixation of Potential Targets:-

Using the standardized variates $[Z_{ij}]$, the economic distance between different districts may be obtained as follows:

$$D_{ip} = \left(\sum_{j=1}^k (Z_{ij} - Z_{pj})^2 \right)^{1/2},$$

(i=1,2,...,n and p=1,2,...,n).

Here $D_{ii} = 0$ and $D_{ip} = D_{pi}$.

The distance matrix will take the form:

$$\begin{bmatrix} 0 & d_{12} & d_{13}\dots & d_{1n} \\ d_{21} & 0 & d_{23}\dots & d_{2n} \\ & & \cdot & \\ d_{n1} & d_{n2} & d_{n3}\dots & 0 \end{bmatrix}.$$

The minimum distance for each row, (d_i , $i=1,2,\dots,n$) will be obtained from the distance matrix for computation of upper and lower limits (C.D.) as indicated below:

$$C. D. = \bar{d} \pm 2\sigma_d,$$

where

$$\bar{d} = \sum_{i=1}^n \frac{d_i}{n},$$

and

$$\sigma_d = \left(\sum_{i=1}^n \frac{(d_i - \bar{d})^2}{n} \right)^{1/2}.$$

The distance matrix can also be used for fixing targets for different districts on each indicator, which would be in the direction of reducing the disparities. The districts should be identified which are homogeneous with a close proximity to each other with the district under consideration, in terms of considered indicators. For setting out the targets, the model districts are to be identified on the basis of composite index and individual distance with districts. The best values among the model districts will be taken as potential target for a particular district for a given indicator. This procedure will be repeated for a given district for all indicators considered. This would give the extent of improvement required in different indicators for balanced development in the district. It also provides avenues to bring about uniform regional development in the state. Such information helps the planners and administrators to readjust the resources to reduce inequalities in level of development among different districts of the state.

The study utilizes data on most of the industry sector indicators for the year 2013-2014. A total of forty three development indicators have been included in the study.

Developmental Indicators:-

Each district faces situational factors of development unique to it as well as common administrative and financial problems. The composite indices of development for different districts have been obtained by using the data on the following indicators. The different indicators are classified into the following categories [16].

[X] Handloom

x_1 : No. Of HTC

x_2 : No. Of trainees in HTC

x_3 : No. Of WESU

x_4 : Production of WESU

x_5 : No. of HDC

x_6 : Production of HDC

x_7 : No. of weavers engaged in HDC, part time

x_8 : No. of weavers engaged in HDC, full time

[Y] Sericulture

- y₁ : No. of Sericulture village
- y₂ : No. of family engaged in eri
- y₃ : No. of family engaged in muga
- y₄ : No. of family engaged in mulberry
- y₅ : Total area under silkworm food plants (eri)
- y₆ : Total area under silkworm food plants (muga)
- y₇ : Total area under silkworm food plants (mulberry)
- y₈ : Yield of Eri Cocoons
- y₉ : Yield of Muga Cocoons
- y₁₀ : Yield of Mulberry Cocoons
- y₁₁ : Production of silkyarn (eri raw silk)
- y₁₂ : Production of silkyarn (muga raw silk)
- y₁₃ : Production of silkyarn (mulberry raw silk)

[Z] SSI

- z₁ : Achievement of khadi and village industry (unit functioning)
- z₂ : Achievement of khadi and village industry (production)
- z₃ : Achievement of khadi and village industry (employment)
- z₄ : Number of registered bill fisheries.
- z₅ : Production of fish seed
- z₆ : Total number of MSME units
- z₇ : Total workers of MSME units
- z₈ : Number of registered factories
- z₉ : Number of registered workers
- z₁₀ : Production of rubber in area.
- z₁₁ : Production of rubber
- z₁₂ : Tapping area.
- z₁₃ : People in household industry (main worker)
- z₁₄ : People in household industry (marginal worker)

[V] Infrastructure

- v₁ : State High way in km
- v₂ : Major district road in km
- v₃ : Rural road in km
- v₄ : Urban road in km
- v₅ : Total road length
- v₆ : Road length in km per lakh population
- v₇ : Road length in km per (00) sq km of geographical area
- v₈ : Number of villages electrified.

Comparison of Ranks:-

We have used Spearman rank correlation co-efficient to test if there is any significant difference in the ranks obtained by the two methods. The rank correlation co-efficient is given by Ronald et. al.(1985)

$$r_s = 1 - \frac{6 \sum_{i=1}^n d_i^2}{n(n^2 - 1)}$$

where d_i is the difference between the ranks assigned by the two methods and n is the number of pairs of data [15].

Results and Discussions:-

The Level of Development:-

The districts have been ranked on the basis of development indices. Table-1 presents the composite indices of development along with the ranks of different districts. It may be seen from the above table that out of 23 districts of the State, the district Kamrup is ranked first whereas the district Hailakandi is ranked last in the overall industrial growth.

Table 1:- Ranks of all the districts of Assam obtained from the two methods.

DISTRICTS		INDUSTRY									
		HANDLOOM		INFRASTRUCTURE		SERICULTURE		SSI		OVERALL	
		N	M	N	M	N	M	N	M	N	M
1.	KOKRAJHAR	23	19	12	14	6	1	22	20	4	18
2.	DHUBRI	20	16	16	17	23	23	7	7	20	21
3.	GOALPARA	9	9	15	13	16	10	15	3	10	12
4.	BARPETA	3	1	9	10	17	18	9	12	11	4
5.	MARIGAON	7	14	21	19	15	16	14	14	14	8
6.	NAGAON	15	3	2	2	8	12	2	2	2	5
7.	SONITPUR	16	4	4	6	9	13	3	8	6	11
8.	LAKHIMPUR	12	11	17	18	1	2	18	21	8	10
9.	DHEMAJI	14	22	14	12	2	4	23	22	16	16
10.	TINISUKIA	21	17	11	11	11	15	6	11	15	19
11.	DIBRUGARH	6	10	10	9	4	8	5	10	9	3
12.	SIVSAGAR	5	8	6	4	5	3	11	15	5	6
13.	JORHAT	18	15	8	8	3	5	8	9	7	14
14.	GOLAGHAT	10	12	5	7	13	9	12	19	13	13
15.	K.ANGLONG	13	6	1	1	14	7	19	4	3	15
16.	D.HASAO	22	18	7	3	20	17	13	23	21	23
17.	CACHAR	11	13	18	20	12	14	4	6	14	9
18.	KARIMGANJ	17	21	19	21	18	22	10	5	18	20
19.	HAILAKANDI	19	23	23	23	19	21	21	17	23	22
20.	BONGAINGAON	8	20	22	22	21	19	20	16	22	17
21.	KAMRUP	1	2	3	5	7	6	1	1	1	1
22.	NALBARI	2	5	20	16	22	20	17	18	17	2
23.	DARRANG	4	7	13	15	10	11	16	13	12	7

* N denotes Narain et. al. method and M denotes Michela et. al. method.

It is seen that, for most of the districts, ranks calculated by the two methods are almost same whereas for a few other districts, ranks calculated by the two methods are different.

We have tested the hypothesis that the correlation between the ranks obtained by Narain *et. al.* method and the Michela *et. al.* method is zero against the alternative hypothesis that it is greater than zero. At both 0.01 and 0.05 level of significance, it is observed that the two methods are correlated and there is no significance difference between the ranks obtained from the two methods.

Area and Population in Different Stages of Development:-

It would be quite interesting and useful to find out the relative share of area and population affected under different levels of development in the State. The area and population covered by the districts falling under different levels of development are presented in Table 2.

Table 2:-Area and Population under Different Levels of Development

Level of Development	No. of Districts	Population (%)	Area (%)
High (≤ 0.679)	3	17.7	23.8
Medium (0.679-0.786)	7	32.8	27.4
Developing (0.786-0.892)	10	41.7	37.7
Low (≥ 0.892)	3	7.8	11.1

It is evident from the table that about 23.8% area consisting of about 17.7% population of the State fall in the districts which are high developed. About 11.1% area and 7.8% population fall in the districts which are low developed in the industrial sector. The low developed districts which have been found in this study are Hailakandi, Bongaingaon and Dima-Hasao. List of model districts for these low developed districts is presented in Table-3.

Table 3:-Model Districts for Low-developed Districts

S. No.	Low Developed Districts	Model Districts
1.	Hailakandi	Morigaon, Kamrup, Golaghat, Nalbari
2.	Bongaingaon	Morigaon, Kamrup, Nagaon, Cachar
3.	Dima-Hasao	Kamrup, Karbi-Anglong, Cachar, Nalbari, Nagaon

The districts Kamrup, Nagaon and Morigaon are found to be the model districts for most of the low developed districts.

Potential Targets of Indicators for Low Developed Districts:-

It would be useful to examine the extent of improvements required in different indicators of the low developed districts for enhancing the level of development. The best values of the indicators of better developed districts will be taken as potential targets for the low developed districts. The extent of improvement needed in various indicators of the low developed districts is given below:

Table 4:-Estimate of Potential Target and Actual achievement (given under the bracket).

*Indicates actual achievement that already better than the potential target.

It is found in the industrial growth sector, that the districts of Kamrup, Nalbari, Dibrugarh and Sibsagar are high developed districts. The districts of Hailakandi, Dhubri and Dima-Hasao are low developed districts. The remaining are middle developed and developing districts.

Conclusion:-

The broad conclusions emerging from the study are as follow:

Two ranking methods, viz. Narain *et. al.* and Michela *et. al.* are used to rank the districts of Assam on the basis of industrial development of the state. It is observed that both the methods gave almost the same ranking. A ranking test is carried out and it is observed that there is no significant difference between the two methods.

With respect to overall development in the industrial progress, the districts of Kamrup, Karbi-Anglong and Nagaon are found to be better developed as compared to the remaining districts of the State. Similarly the districts of Hailakandi,

Bongaingaon and Dima-Hasao are low developed districts. The level of development in the rest of the districts is of average order but most of these districts are having the tendency to make improvements in the pattern of development.

As compared to the previous study, this study reveals significant changes in the status of the districts Nagaon, Kokrajhar and Karbi-Anglong by improving the ranks and Dibrugarh, Golaghat and Tinisukia by deteriorating their ranks, which may be understood in the light of two different parameters; i) introduction of SSI as one new parameter, ii) improving the status of existing parameters.

Nagaon and Karbi-Anglong gain their rank as SSI index were 2 and 4 which boosted up the overall rank from 6 and 11 to 2 and 3 respectively. Because of consideration of SSI in the new study which was not in the earlier study. Even both the districts show downfall in the indices of handloom in the later study. For the district of Kokrajhar, the better socio-political scenario boosted up the sericulture productivity indices from 20 to 1 and hence overall tabled at rank 4.

For the district of Dibrugarh, deteriorating sericulture sector and average SSI pulled it back and placed it at the rank 9 in lue of 2 in the previous study. Same is the scenario for the district of Golaghat. For Tinsukia district, deteriorating hand loom sector added with poor sericulture and SSI indices pulls back its rank from 10 to 15.

Despite of all changes in our procedure and timely developmental activities between two studies, Kamrup district holds its original rank.

In order to reduce the disparities, district level studies or setting the objective in the district level may not be a wise idea. So, looking for the potential areas for development in taluka or block level may be of great importance and emphasis on over all developmental indexes will be of good use to reduce the developmental disparities

Abstract

The objective of this review is to understand the effect of cryogenic treatment on tool life and its performance. As cutting tool life is an important factor in reducing the cost of production. In this process of cryogenic treatment, tools are generally subjected to the process such as heat treatment for achieving the hardness which will improve the performance of the tool to some extent. Cryogenic treatment also known as cold treatment, in which the phase transformation of the material takes place, is mainly responsible for changes in the wear resistance, tensile strength, toughness etc. which increases the tool life. From the review it was understood that has great effect on cutting tool properties. Especially soaking period varied from 6 hours to 36 hours are giving different effect on the phase transformation of the material, consider as one of the important aspect for tool life improvement. Various soaking range namely shallow cryogenic treatment (SCT), Cryogenic treatment (CT) and deep cryogenic treatment (DCT) produce different properties in tool material. This treatment or process can be very useful in case of machinability of work-piece, quality of machining in terms of surface finish and economics of the tooling.

Introduction:-

In metal working industries, the tool materials used for cutting tools are all belong to a separate class of steels called as Tool Steels. Tool steels are called so because of a few very important machinability properties they possess such as 'abrasion resistance' 'resistance to deformation' 'high hardness' 'hot hardness' and so on. Because of these, tool steels are used for applications involving shaping other materials. High quality of the tool steels are achieved through controlled chemical compositions which give them the desired properties for shaping materials. The type of tool steel depends on the percentage of carbon (usually 0.1% to 1.6%) and the alloying elements used. Molybdenum, vanadium, chromium are very commonly used and their benefits are very well documented and widely used in the metal industry. Tool steels are widely used for applications such as die casting, plastic molding, making cutting tools, various sheet metal tooling's such as blanking, shearing, forming and so on. Tool steels offer better choice than common construction and engineering steel materials because of their corrosion resistance, durability, stability at high temperatures.

In steel making industries there has been special attention set on producing tool steels particularly the high alloyed steels intended for the purpose of plastic molding, forming, blanking, die casting, forging extrusion, recycling and wood- working. Steels are also produced by following the Powder Metallurgy. Tool steels can be procured in soft annealed condition because of which they are easily made into cutting tools. The soft annealed condition tool steel are also well suited for hardening. The microstructure provides pockets to embed the carbide particles.

Generally Iron Carbides Fe_3C are the particles which give high strength to carbon steels. Whereas in alloy steels Tungsten (W), Vanadium (V), Molybdenum (Mo), Chromium (Cr) carbides depending on the composition of the steel. The carbides are characterized by high hardness. The wear resistance improves with the increase in percentage of various carbides and their distribution in the steel crystal structure. Non carbide forming elements when alloyed, get absorbed into the metal matrix. Cobalt and Nickel are one such alloying elements. Cobalt improves the red hardness in high speed steels, nickel improves the hardening properties as well as the toughness in hardened condition. Other inclusions in steel like manganese are kept low to avoid cracking due to thermal load during water quenching

Metal cutting is the backbone of manufacturing industry. Each and every product ever made in history can trace its origin to the basic metal cutting process. The cutting tool therefore is the important element for any metal cutting operation to realize its true potential. Since the last few decades, in a bid to make the processes economic, a lot of effort has been put into the research of metal cutting. The results have thus given birth to newer tool materials with marked improvement in performance thereby improving productivity. Lighter yet stronger tool materials have been the catch words among the cutting tool manufacturers. Some of the other properties which are highly desired are

- Resistance to diffusion.
- Resistance to brittle fracture.
- Ease and economy of fabrication of the tool.
- High resistance to thermal and mechanical shocks.
- Ability to retain strength at high speeds and withstand the heat generated during cutting operation.

The enormous developments taking place in the cutting tool technology is driven by the knowledge about the capabilities of the tool materials to work under different conditions of stress, high temperatures at the interface between tool and work piece. The tool wear occurs by different mechanisms which include thermal cracking, chipping at the cutting edges of the tool and abrasive wear. The tool materials should therefore have good mechanical, physical, chemical properties at such elevated temperatures¹⁻⁴

Tool steel grades:-

Various tool steel grades have been developed over the years and are well established in AISI and SAE tool steel grades. The different alloy tool steels in each of the grades are given a number to be identified with. In total, there are 6 different grades of tool steel material. The choice of the tool steel grade is influenced by the cost, surface hardness required, working temperature, toughness, shock resistance, durability, and strength. If the working conditions are expected to be severe, the respective alloying element is chosen depending on the properties they enhance on the steels.

Tool steels prepared by water quenching are known as water hardening group, these steels can have a maximum hardness of 66HRC. O - series and A - Series are also based on quenching medium used (Oil for O - series and Air for A - series). The Oil hardening series have up to 7 types numbered from O1 to O7 and D - series (High Carbon High Chromium steels) in which the chromium content is up to 13%. Next is the shock resistance alloyed tool steels which are prepared by alloying elements such as chromium, silicon, tungsten, molybdenum, manganese and approximately 0.5 % C is maintained where higher toughness is expected. Most widely used is High speed steels which are used in cutting tools such as turning tool, drill bits, saw blades. These are used predominantly in cutting operations of mild steels and other softer materials. When the materials are to be cut, formed at high temperatures, a special type of tool steels called Hot Working tool steels is used. The hot hardness and wear resistance are provided because of the presence of carbide content of the alloying element. This is the most populated group of tool steels with close to 60 types. The types numbered from H1 to H19 are high chromium content (up to 5%), H20 to H39 are tungsten alloy (9% to 18%), H40 to H59 being molybdenum based. These have low carbon content.

Introduction to Cryogenic Process:-

Cryogenic is a term used to refer to things at very low temperatures. The idea of very low temperatures is not a modern one. It has been used as back in the time as the 16th century

when it was used to enhance some mechanical properties. Cryogenic treatment induced positive effects on the key parameters such as tool performance, tool wear. Mohan et al have achieved a 110% gain in tool life after studying the effects of cryogenic treatments. Its applications are very wide in range as it has been used for ferrous, non - ferrous metal alloys, ceramics, plastics, carbides. In conventional heat treatment methods, the changes take place on the surface or only up to certain depth. Whereas in Cryogenic treatments the changes take place at the basic crystal structure of the material,¹ As a bonus there is no negative influence on the corrosion resistance of the material. The effect of DCT on various other grades of steel like the stainless steel type by conducting Qualitative salt spray corrosion test confirming the same.² Thus Cryogenic treatment has been a very effective process to obtain many desirable properties in metals.

The actual process of Cryogenic treatment is quite simple. The material samples will be cooled to very low temperatures by means of a cooling system regulated by a control unit. Gases like nitrogen, helium are used to cool to extremely low temperatures like -80°C to -196°C . The abundant availability of nitrogen in the atmosphere and its suitability for carrying out cryogenic treatment has made it the quintessential component of Cryogenic Treatment. It has a melting point of -210°C and boiling point of -196°C . The samples will be kept at cryogenic temperatures for some time. This period is called 'holding time'. It is during this holding time that the change to the microstructure takes place. After this the material samples are brought gradually to room temperatures. Figure 1 shows the Schematic presentation of cryogenic treatment applied in a controlled manner³.

Figure 1. Schematic presentation of cryogenic treatment applied in a controlled manner⁴

The results of cryogenic treatment are obvious and their improvements over untreated samples are astounding. Marked improvements in abrasion resistance, toughness, hardness, electrical conductivity can be seen in cryogenic treated samples. These can be attributed to generally the two underlying mechanism (i) conversion of austenitic structure into martensitic. (ii) Finer distribution of the carbides in the metal matrix. The presence of nanosized carbide particles through the study of microstructures. As a result Cryogenic treatment is widely used to increase the performance of chip breaker tools. When undertaken on bigger scale these methods also offer economy over other methods such as coating. Cryogenic treatments are also applied on cutting tools, race car engines, tool steels, brake discs, composites and on some plastics.⁴ Figure 1 shows the Schematic presentation of cryogenic treatment applied in a controlled manner⁵

Basically the Cryogenic treatments can be broadly classified into two types. (i) Shallow Cryogenic Treatment – SCT & (ii) Deep Cryogenic Treatment – DCT. The treatment in which the cryogenic treatments are kept at -80 to -149°C is called SCT and DCT involves even lower temperatures at -140°C to -196°C . Figure 2 shows the Variations of temperatures during Cryogenic Treatment⁵

Rate of cooling:-

The material should be brought to the cryogenic temperature and then it undergoes soaking at same temperature for period of 2 hrs to 48 hrs depending on requirement, figure 2 shows the variations of temperatures during cryogenic

treatment. In rate of cooling there are two main approaches, in the first approach the samples slowly brought to cryogenic temperature in between (-80°C to -196°C). in the second approach, the samples are slowly brought to cryogenic temperature. According to the study the second approach is recommended as some damages like micro cracks are developed on the sample due to thermal shock.

Figure 2. Variations of temperatures during Cryogenic Treatment ⁴

The used carbide cutting tools at two different rates of cooling/heating ($0.5^{\circ}\text{C}/\text{min}$ and $1^{\circ}\text{C}/\text{min}$) and completed the cryotreatment in 8h and 4h and reported that the wear resistance was better in the sample ($0.5^{\circ}\text{C}/\text{min}$, 8h) compared to ($1^{\circ}\text{C}/\text{min}$, 4h). sudden decrease in temperature (thermal shock) reduces the cost of cryotreatment but increases the risk of occurrence of micro cracks in the microstructure of the specimen due to which the specimen may not give better performance. So in cryotreatment the slow cooling/heating process is recommended. ⁶

Soaking Period:-

After the literature review of cryotreatment (DCT) on the tool steels the samples were subjected to soaking period in between 1 and 40 h were the conversion of material from austenite to martensite takes place and the formation of new carbides takes place for carbide distribution. The soaking of Ti-6Al-4V alloy up to 72h (DCT) at -196°C . Therefore the soaking period should be optimized to increase the wear resistance efficiency and reduce the cost of cryogenic treatment. ⁷

Soaking Temperature:-

Cryogenic treatment also known as sub-zero heat treatment shows the variation according the type of tool steel material. Cryogenic treatment temperatures applied to cutting tools range between -80°C and -196°C . Taking as -80°C - Cryogenic treatment, -120°C - Shallow Cryogenic treatment and -196°C - Deep Cryogenic treatment. The study shows that to increase the wear resistance to the samples the soaking temperature plays an important factor. From the literature studies it is found that -196°C (DCT) gives the best result in the improvement of mechanical properties of the specimen.

Tempering Process:-

Tempering is usually done after the cryogenic treatment. The process is mainly performed to remove the internal stresses of the specimen that occur due to excessive cooling in cryogenic treatment. Generally, the process is applied to cutting tools by holding the specimen at $150-200^{\circ}\text{C}$ for 1.5–2 h. In some previous studies has under gone double tempering after cryogenic treatment and a fine distribution of Carbide particles have been obtained by double Tempering after CT ⁸ as represented in Figure 3. In some studied the results show that Tempering indeed maximizes the gain in tool life after DCT (86% without Tempering, 126% with Tempering). ⁹ through investigations have found that tempering before actually decreases wear resistance as against increasing it. On a hind note it has been observed that multiple cycles of Tempering after DCT hasn't improved on the wear resistance, but has a negative impact. Also there has been decrease in wear resistance after multiple cycles of Tempering, compared to CT and HCT samples. ¹⁰

Figure 3. Variations of temperatures during the Tempering process, after Cryogenic Treatment ⁶

Results and Discussion:-

Tool life:-

The actual length of the cutting time that the tool can be used is known as tool life. Generally the tool failure happens due to sudden breakage of tool tip or due to the gradual wear of the tool is known as flank wear or crater wear, the tool wear is mainly caused due to increasing cutting forces and cutting temperature, which leads to the poor surface finish and accuracy of the components. The tool life was found increasing generally by the research conducted there was the improvement of about 86% for M2 tool steel and 48% for D3 tool steel compared to heat treated tool steel.¹²

There are mainly three stages of flank wear rapid growth region, steady state region (Temperature insensitive region) and Catastrophe failure (Temperature sensitive region). Flank wear formation mainly depends on cutting condition i.e. Parameters like speed, feed and depth of cut as well as the properties of the work and tool material.

Microstructure:-

A detailed study of the mechanism which improves the mechanical properties in Deep cryotreated materials has been provided where presence of different alloyed carbide has been absorbed in the sample even before, have also reported about various carbides being present.^{13,14,15} The carbides have been classified into primary carbides and secondary carbides. Primary carbides are large, spherical in shape and their sizes are in excess of 5µm whereas secondary carbides are in irregular shapes. Secondary carbides are further classified into small (i) Secondary carbides (SSC) of size from 0.1 µm to 1 µm and (ii) Large secondary carbides (LSC) of size from 1µm to 5 µm. All studies point to benefits of DCT in multiple ways. A great reduction in the amount of retained austenite is seen – in most cases retained austenite content is reduced to as low as 4%. The microstructural changes increase the wear resistance of the material.

The martensitic phases in the steels are further conditioned during DCT leading to precipitations of high amount of ultrafine secondary carbides. Secondary carbides are generally hard and thus contribute to improved wear resistance. The micro structural changes that occurred during DCT as shown in figure 4, 5 and can be compared to the figure 6 which is of cryoheat-treated (CHT) for D2 tool steel. From these illustrations it can be seen that DCT enables precipitation of fine and ultrafine carbides in the material. The reduction in the amount of Retained Austenite is confirmed from XRD profile obtained for such DCT material specimen. A very scant amount of retained austenite has been detected by TEM studies from the DCT specimen. The secondary Carbides are made up of M₂₃C₆ where as eutectic M₇O constitutes primary carbides along with small amount of C₇Cr₃ carbides.¹⁶

Figure 4. Optical Micrograph showing various carbides ¹³Figure 5. SEM Micrograph of DCT on AISI D2 Steel ¹³Figure 6. SEM Micrograph of CHT on AISI D2 Steel ¹³

The reciprocator friction and wear monitor test on SCT and DCT samples of En 52 and 21-4N valve steels. The results have shown that the wear resistance has increased in DCT sample compared to SCT samples. The microstructure of the En-52 and 21-4N (CHT, SCT and DCT) variants is shown in figure 7 and 8. A very large white patches can be seen in CHT sample in which martensite and retained austenite both exist together where as in cryotreated specimens (DCT) the austenite is fully transformed into martensite form, in SCT the austenite is retained in small fraction. Since the martensitic phase is the last phase that enhances the hardness uniformly throughout the material which increases the wear resistance of the material. The clusters of primary and secondary carbides are also seen in SCT and DCT samples. ¹⁷

Figure 7. The microstructure of En 52 CHT, SCT and DCT ¹⁴

Figure 8. The microstructure of 21-4N CHT, SCT and DCT ¹⁴

The optical microstructure studies ¹⁸ on CHT and DCT samples for D2 tool steel also confirmed the same as in other studies. The DCT sample again exhibit higher carbide precipitation and a finer distribution of secondary carbide than none at all in CHT samples which shows irregular shaped primary carbides. Comparative microstructural images are given figure 9.

Figure 9. The microstructure of D2 CHT, DCT ¹⁵

Various sequences of hardening and tempering process along with DCT were carried out on D3 tool steel by SimranPreet ¹⁹ the results of experimentation were studied through microstructural studies. The various sequences of heat treatment process are tabulated below. The figure 10(a) shows the microstructure of the as the received state of D3 large accumulation of carbides of all irregular shapes can be seen carbides get dissolved in the medium after hardening process and the materials takes different changes based on the subsequent process carried. It can be seen through comparison between the figure 10(b) and 10(c) for B-I and B-II sequence that the size of carbides have been reduced. When cryotreatment was followed by tempering and double tempering the carbides can be seen to getting more cores through a phenomenon called “Ostwald ripening” (smaller particles getting deposited onto larger carbides).

Figure 10. Microstructure of D-3 steel for treatments B-I, B-II, B-III, B-IV and B-V: (a) raw (500×); (b) HT (500×); (c) HC (500×); (d) HCT (500×); (e) HCTT (500×); (f) HCTTT (500×).¹⁶

The changes in D2 and D3 tool steel after cryogenic treatment, Globular shaped carbides of 9 micron and nodular shaped carbides of 11X4 micron can be seen in the microstructure of CHT of D2 in figure 11(a) and untempered martensite and retained austenite was seen of about 10% and 50% respectively there has been an decrease in carbides size both in globular and nodular shape as compared to just austenizing, quenching and tempering process. The distribution of carbides is more uniform figure 11(b). the carbide sizes in both forms was found to increase in AQCT process after tempering however multiple tempering process after cryogenic treatment increases the retained austenite there by neglecting the overall benefits of cryogenic treatment therefore multiple tempering treatment is not advisable after DCT.²⁰

Figure 11. Microstructure of various combinations of treatments for the specimen of D2 steel a) CHT b) AQC c) AQCT d) AQCTT e) AQTCT¹⁷

Figure 12(a) which shows the microstructure of D3 tool steel of CHT, there has been up to 20% of the globular shaped carbide content of size 3x6 microns. The well distributed structure was observed with around 7% of untempered martensite the carbide content is up to 4% in AQC sequence figure 12(b) which shows the positive effect

of tempering after cryogenic temperature. The medium contains up to 95% of unstable austenite figure 12(c) the carbide distribution is more uniform. Nodular carbides of 2X4 microns are also seen amounting to 15%, on further tempering multiple times the retained austenite content goes on reducing and the untempered martensite is increasing in content from 5% to 7% in further sequences in AQCTT and AQTCT sequences.²⁰

Figure 12. Microstructure of various combinations of treatments for the specimen of D3 steel a) CHT b) AQC c) AQCT d) AQCTT e) AQTCT¹⁷

Huang²¹ studied the effects of cryogenic treatment and subsequent tempering had on the precipitation of carbide in M2 tool steels using the TEM micrographs of untreated and cryotreated M-2 tool steel as shown in figure 13 and has concluded that the distribution of carbide as well as their sizes remained same in treated and untreated cryogenic samples, but the density of the carbide content was different during the treatment as the retained austenite is converted into martensite, internal stresses are developed in the samples this is caused due to the chain reaction the stress are mainly caused due to the changes in the composition and microstructure which causes dislocation and twinning in the crystal structure. High internal stresses are developed when the samples are cooled below certain temperatures, when the holding time is long enough the carbon and other alloying elements diffuses to the defected sites thus creating a cluster of carbon and alloying elements. As the martensite becomes supersaturated due to decreasing temperatures during cryogenic treatment the resulting thermal instability and lattice distortion drive the alloying atoms and carbon atoms clustering near defects. It is around these clusters where carbides are formed when the tempering process is followed after cryogenic treatments.

Figure 13. TEM micrographs of M-2 steel (a) and (b) Representative regions from the same untreated sample (c) Cryotreated sample¹⁸

In the series of experiment^{22,23,24} significant precipitation of secondary carbides was observed. As in most studies of cryogenic treatments on tool steels mechanical properties have improved figure 14 shows the SEM micrographs of various cryotreatment, In cryogenic treatment holding time has a significant effect on wear resistance properties. It is found that the wear resistance increases as the holding time increases up to 36 hours and decreases beyond that. Thus a function between the density, distribution of carbides and holding time can be established which agrees in the case of M2 tool steel strongly.

Figure 14. High-magnification SEM micrographs: (a) conventionally quenched and tempered; (b) cryogenically treated for 36 h; (c) Cryogenically treated for 84-h²¹

The authors also concludes that the wear resistance on the material will have a positive effect only till the holding time is 36 hours only, and beyond that the material will show the reverse effect i.e. decrease in the properties.

Wear behavior:-

The wear of tool during a wide range of industrial applications is a serious issue in the production prospective. Cryogenic treatment is a best solution to reduce the tool wear which is also effectively proved by the authors. There was an increase in wear resistance by 18.54% and 14.04% for a load of 50N and 25N respectively.²⁵ In some cases an improvement of wear resistance in D3 tool steel by 80%. The co-efficient of friction was also found to decrease which point to the quality surface finish was obtained in cryotreatment.²⁶

Conclusion:-

- The cryogenic treatment has been used effectively to enhance the mechanical properties like wear resistance, hardness of various grades of steel.
- The core benefits of cryogenic treatment are increase in wear resistance and hardness.
- Soaking period and temperature also plays an important role in varying the properties of the tool.
- These benefits are effectively applied to various tool steels to maximize the tool life.
- The underlying mechanism had been conversion of austenite to martensite structure. The tool life also gets enhanced through increased wear resistance caused by the deeper distribution of carbide particles in the material.
- Maximum benefits from can be achieved in cryogenic treatment by controlling the parameters such as (holding temperature, holding time, identification of heat treatment to be applied before or after, etc.) which should be applied under optimum conditions.

Declaration of conflicting interests:-

- There are no potential conflicts of interest with respect to the research, authorship, and/or publication of this article.

Introduction:-

Being a Mathematics Teacher in a Senior Secondary School of our locality, I personally observe the fact that students of Secondary Sections pay less attention as well as they are less interested in the Subject General Mathematics in comparison to other Subjects. They have a fear in mind about Mathematics and so always hesitate to apply their intellect in solving sums. As the subject itself can't produce any interest among the students unlike to literature, history, Social Science etc from which the students get something interesting going through the lessons and hence they pay less attention to that subject.

To make Mathematics interesting, I myself have tried to help them learn with the help of different models which I have made myself of angles, triangles, quadrilaterals, geo-board, Models of Venn diagrams with simple things like ball pens, riffles, straw pipes, Card-boards bangles and plywood etc. The result I got is very interesting. The students get interested in Practical Classes but still they are lagged behind in theoretical knowledge. Taking this matter as a subject of my project, I have collected the marks obtained in Annual Examination of last two years of the students of Class – IX and Class – X in mathematics and Social Science and a thorough Statistical Study has been done.

Methodology:

A statistical survey has been performed among the students of Class – IX and X in a High School in our locality and their marks in General mathematics and Social Science in Annual Examination for 2015 and 2016 respectively and the marks obtained by them have been tabulated in grouped data and the result has been thoroughly studied to find the fact if they are lagged behind in Mathematics in Comparison to Social Science. The marks obtained by the students in General Mathematics and Social Science is tabulated in grouped data and the results are shown graphically.

**Observations:-**

The above statistical data shows that less Number of Students obtain 60% or above marks in General Mathematics in comparison to Social Science. The number of Students getting 60% or above in Mathematics in the Annual Examination in 2015 is 03 in Class IX comparison to Social Science where the number is 8. In Class X also the number of Students getting 60% and above marks in Mathematics is only 02 (Two) and in Social Science the number of such students is 07 (seven). In 2016 also the number of students getting 60% and above marks in Mathematics in Class IX is only 02 (Two) where as in Social Science the number is 15 (fifteen). The result of the observations is as follows –

Percentage Of Marks	In 2015				In 2016			
	No Of Students Of Class IX		No Of Students Of Class X		No Of Students Of Class IX		No Of Students Of Class X	
Subjects	G. Math	Social Science	G. Math	Social Science	G. Math	Social Science	G. Math	Social Science
Below 30%	48	17	26	06	47	12	19	02
50% And Above	15	41	12	23	10	35	11	30
60% And Above	05	20	05	15	06	24	07	27
80% And Above	02	08	02	07	02	15	02	05

Causes for weakness in Mathematics:-

According to my observation, some of the causes for weakness in Mathematics in comparison to other Subjects are –

1. Theory part of Mathematics is itself not interesting and some of the topics can also be not represented by different models or diagrams.
2. In lower primary as well as upper primary classes the basic Concepts of different mathematical terms have not been explained in easy language and with sufficient diagrams in text books.
3. There is Lack of sufficient elaborate explanations of different mathematical terms and definitions in Text books.
4. Insufficient Equipments or instruments for Practical Classes in Mathematics in the Senior Secondary Schools

Remedial Suggestions:-

From my own experience, I had innovated myself some methods to grow interest in Mathematics –

1. In lower and upper primary classes the basic concepts can be explained with the help of different games among the students.
2. Geometric concepts can be explained with the help of different models and Geo-boards.
3. Difficult problems of Set theory can be made easy to understand with the help of models of Venn diagrams of different set operations
4. To make the subject interesting audio – video classes, different workshops and seminars should be frequently arranged in the schools.

Abstract

Background: The transfusion of blood products is life saving especially at emergency conditions. The platelet transfusions helps in prevention of bleeding related complications and thus prevents morbidity and mortality in thrombocytopenic patients. Platelets are transfused by two methods i) by fractionation of whole blood and ii) by platelet apheresis. The quality of single donor platelets (SDP) in terms of yield influences platelet recovery in the recipient.

Material and Methods: A sample of 360 donors were included in the study over a period of one and half year. Various donor-related factors were meticulously recorded prior to performing plateletpheresis. The aim was to identify donor factors that influence platelet yield. The plateletpheresis procedures were performed using Trima accel machine. A relationship between pre-donation donor variables and yield of platelets was studied using the Pearson correlation.

Results: The mean platelet yield was $2.29 \pm 0.43 \times 10^5/\mu\text{L}$ per donor. A positive correlation was observed between platelet yield and pre-donation platelet count, body mass index (BMI; Kg/m²) of the donor, while a negative correlation was observed between age and the platelet yield.

Conclusion: Donor pre-donation platelet count, BMI and donor age influence platelet yield. Young healthy donors with a high platelet count and better BMI can give a better platelet yield in the SDP.

Introduction:-

Platelets are essential for the formation of primary haemostatic plug and maintenance of haemostasis. Approximately 2.2 million platelet doses are transfused annually in the United States (1). A high proportion of these platelet units are transfused prophylactically to reduce the risk for spontaneous bleeding in patients who are thrombocytopenic after chemotherapy or hematopoietic progenitor cell transplantation (HPCT) (2,3). Either a pool of 4 to 6 units of random donor platelet or 1 unit of single donor platelet (SDP) is transfused (4). One unit of SDP should contain a minimum of 3×10^{11} platelets as per American Association of Blood Bank (AABB) guidelines (11) while European guidelines advocate that one SDP should contain 2×10^{11} platelets (5,6). Unlike other blood components, platelets must be stored at room temperature, limiting the shelf life of platelet units to only 5 days because of the risk for bacterial growth during storage. Therefore, maintaining hospital platelet inventories is logistically difficult and highly resource-intensive (7,8). Platelet transfusions can be done either as i) a pool of 4 to 6 units of random donor platelet, or ii) 1 unit of single donor platelet (SDP) is transfused (4).

Address:- Senior Resident, Department of Transfusion Medicine, SKIMS, Srinagar, Jammu and Kashmir, India.

Plateletpheresis (apheresis= to remove) is a procedure designed to collect large number of platelets from single donor thereby giving more consistent product (9). As per guidelines of American association of blood banks plateletpheresis (Single Donor Platelets) unit must have platelet count of 3×10^{11} which in turn raises platelet count by 30,000-60,000 per micro litre and is equivalent to 4-6 units of random platelet concentrates (10). Compared to whole blood donation, apheresis has advantages for the donor, such as there is lesser loss of red blood cells. However, apheresis can also lead to specific adverse events such as citrate toxicity or, for single needle devices, extracorporeal circulation reactions (11-13). Platelet transfusion success depends on rational use of platelet components and on the quality of the component. Platelet recovery in a patient is influenced by the transfused dose of platelets which in turn is dependent on the platelet yield.(14) The possibility of obtaining higher platelet yields has important clinical implications: it reduces frequency of platelet transfusions and number of donor exposures with important consequent clinical and economic advantages.(15,16)

Material and Methods:-

This is a prospective case study conducted from August 2015 to December 2016 at tertiary care centre in North India. A total of 360 healthy donors comprising of 359 men and 1 woman with mean age of 41.8 years were selected from plateletpheresis donor registration. With the exception of the donation interval, the requirements for apheresis and whole blood donation are the same. Apheresis donors must meet the requirements for whole blood donation and additionally satisfy criteria that are particular to the selected apheresis. Donors that were less than 18 years and more than 60 years, or were on any medical treatment 7 days prior to the procedure were excluded in this study. Blood samples were collected from donors before and after apheresis procedure. Informed consent was obtained from all donors. Donor screening is required to ensure a safe transfusion for the recipient. Prospective donors must complete several steps before actual platelet donations, including physical examination, a donor history questionnaire, and testing for transmissible diseases. The American Association of Blood Banks (AABB) recommends that prospective donors receive physical examinations including an assessment of weight: hemoglobin, hematocrit, ABO and Rh typing; and inspection for marks from intravenous drug use. Tests are performed for the presence of syphilis, human immunodeficiency virus (anti-HIV-1/2 and HIV-1 RNA), hepatitis C virus (anti-HCV and HCV RNA), hepatitis B virus (HBsAg and anti-HBc). Further, the platelet counts of plateletpheresis donors must be $>150 \times 10^3$ per μl [32]. Individuals can donate 3 days after ingesting aspirin-related medications.

Apheresis was performed using Trima (Gambro BCT, Lakewood, CO). Acid-citrate-dextrose formula was used as anticoagulant during procedures according to the manufacture's recommendations.

All procedures were completed successfully with peripheral venous access . Cubital vein was used for access. All procedures done were single needle. The procedure was continuous and automated. The blood pump speed was set at of 60-80 ml/min . Blood pressure (BP) and pulse were monitored at frequent intervals during the sessions and donors were closely observed for development of any complications and overall status.

Results:-

The results obtained are tabulated below :

Table 1:- The distribution of hemoglobin in the donor of study sample (n=360).

Hb (g/dl)	No. of donors	%age
12-13	27	7.5
13-14	51	14.1
14-15	111	30.8
15-16	105	29.1
16-17	57	15.8
>17	9	2.5

The maximum number of patients had hemoglobin in the range of 14-15 g/dl and 15-16 g/dl, depicting the donors overall had been derived from healthy population. Only where donor constraint was an issue , selection was done in the Hb range 12-13 g/dl and > 17 g/dl.

Table 2:- The distribution of Hematocrit in the donor of study sample (n=360)

Hct (%)	No. of donors	%age
<40	48	13.3
40-45	198	55
45-50	99	27.5
>50	15	4.1

The haematocrit of the donor population were between 40-45% in maximum number of donors.

Table 3:- The distribution of pre-platelet count in the donor of study sample (n=360)

PRE-PLATELET COUNT(/cumm)	No. of Donors	%age
<150	30	8.3
150-200	141	39.1
200-250	108	30
250-300	57	15.8
300-350	24	6.6

The platelet count in our donor population fall in lower range of normal platelet count i.e., 150-200/cumm and 200-250/cumm .

Table 4:- The distribution of platelet yield in the donor of study sample (n=360).

PLATLET YIELD ($\times 10^{11}$)	No. of donors	%age
<2	36	10
2-3	120	33.3
3-4	204	56.6

The platelet yield was between $2-3 \times 10^{11}$ in maximum number of donors.

Table 5:- The distribution of platelet yield in the donor of study sample (n=360)

Adverse effects	Number	%
Citrate reaction	12	3.3
Hematoma	6	1.6
Vasovagal reaction	2	.55
Hypovolemia	1	.27
Mech. Issue	3	.83

The side effects were less observed in the procedure done. The most common reaction had been citrate reaction followed by hematoma formation at vascular access site.

Table 6:- Correlation between various donor factors with Platelets yield.

Platelet Yield	Age	BMI	Hb	Hct	Pre-platelet count
	- 0.329 (<0.01)	+ 0.268 (<0.01)	0.063 (<0.01)	0.021 (<0.541)	0.284 (<0.01)

Discussion:-

Various studies have shown that transfusion of high platelet doses could reduce number of platelet concentrates required by thrombocytopenic patients even in patients with adverse clinical factors in which refractoriness to transfusion is common(17,18). Nevertheless, there are very few studies related to donor clinical and laboratory factors that may influence number of platelet yield (4,19). Identification of these factors would allow for better selection of donors resulting in higher platelet yield and consequently a lower number of donor exposures to the patients. Instruments which collect SDP are programmed to calculate the yield from the donor's haematocrit, platelet count, height and weight.

In our study, the mean pre-donation platelet count was $2.29 \pm 0.43 \times 10^5/\mu\text{L}$ and the mean platelet yield was $2.86 \pm 0.52 \times 10^{11}$. A direct linear correlation was obtained between the pre-donation platelet count and the platelet yield ($r = 0.284$, $p < 0.01$). Ravi et al (20), found the mean pre-donation platelet count was $2.69 \pm 0.65 \times 10^5/\mu\text{L}$ and the mean platelet yield was $3.16 \pm 0.62 \times 10^{11}$. A good direct linear correlation was obtained between the pre-donation platelet count and the platelet yield ($r = 0.284$, $p < 0.01$). Chaudary R et al, reported that out of 94 plateletpheresis procedures, the mean platelet yield was $3.65 \pm 0.80 \times 10^{11}$ when the pre-donation platelet count was $< 3 \times 10^5/\mu\text{L}$, while the mean yield was $2.5 \pm 0.59 \times 10^{11}$ when the pre-donation platelet count was $> 2 \times 10^5/\mu\text{L}$. They also observed a direct relationship between platelet count and platelet yield ($r = 0.50$, $p < 0.001$) (21). In a study, 2708 plateletpheresis procedures having a mean pre - donation platelet count of $2.37 \pm 49 \times 10^5/\mu\text{L}$ resulted in a platelet product with mean yield of $4.24 \pm 1.1 \times 10^{11}$. A direct linear correlation was observed with all the procedures (4). In a study (22) donor pre-donation platelet count was found to positively correlate with the platelet yield ($r = 0.51$, $p < 0.001$). A direct positive correlation was also observed in another study (17) ($r = 0.512$) (23). Our observations were similar.

In our study, 204 donors gave a platelet yield of more than 3×10^{11} per unit and thus 56.6% of our platelet yield met AABB guidelines. As per European guidelines 324 of our donors i.e., 93% had a platelet yield of $> 2 \times 10^{11}$ (20). Chaudhary et al., found only 41.5% of the SDPs met AABB guidelines (19).

Our study showed negative correlation between the donor age and platelet yield ($r = -0.329$, $p < 0.01$). Das SS et al., has showed a significant negative correlation between the donor age and platelet yield ($r = -0.229$, $p < 0.01$) but no such observation was reported in another study (21). The decreasing platelet yield with increasing age found in our study may be explained the physiological decrease that occurs to platelet count with increasing age (22).

We found a positive correlation between platelet yield and either haemoglobin ($r = 0.063$) or haematocrit ($r = 0.021$). While as positive correlation between platelet yield and donor haemoglobin and haematocrit have been found in some studies (25,17). No correlation was observed between the haemoglobin concentration and platelet yield in another study. They reported that donors with a haemoglobin levels of 16 g/dL or more gave a comparatively lower platelet yield. This could be related to the higher plasma volume processed in donors with low haemoglobin concentration thereby giving a higher platelet yield (19).

Furthermore, a positive correlation between BMI and platelet yield ($r = 0.268$, $p < 0.01$).

Similar observations were reported in another study (18) where BMI correlated consistently with a good platelet yield. But, in another study (19) where the quality of SDP in relation to low weight (40.8- 49.9 Kg) of the donors was studied, donor weight was not found to have any effect on platelet yield. Since there was only one female donor, we are not able to calculate the correlation between the platelet yield and gender. In a study (21) it was found that gender also influences platelet yield and women had higher yields. This was possibly because there is a higher prevalence of iron deficiency among women with consequent increase in platelet count; hormonal influence could also play a role.

Conflict of Interest : None .

Abstract

Hallea ledermannii is a medicinal plant commonly used in traditional Gabonese medicine to fight against high blood pressure. The objective of this study was to determine the chemical profile and evaluate the acute toxicity and effect of the aqueous extract of *Hallea ledermannii* on cardiovascular parameters in normotensive rats. Phytochemical screening was carried out by using the usual methods of Bouquet. Acute oral toxicity was evaluated in mice at doses of 50, 300, 2000 and 5000 mg / kg in accordance with OECD Guideline 423. Tests on blood pressure and heart rate were realized by the invasive method in normotensive rats anesthetized at urethane 15%. The results show that *Hallea ledermannii* contains many secondary metabolites. Its polar extracts have of the low contents in total phenol (3.55675 ± 0.083 , 3.27425 ± 0.101 , 2.78675 ± 0.110 mg GAE/g of drugs) and total flavonoids (1.2272 ± 0.197 ; 0.7232 ± 0.187 ; 0.8072 ± 0.129 mg QE/g of drugs). Aqueous extract of *Hallea ledermannii* is not toxic up to the 5000 mg/kg dose. This extract (10, 20 and 30 mg/kg) causes a low in systolic blood pressure and heart rate. These results suggest that the aqueous extract of *Hallea ledermannii* can be used orally up to the 5000 mg / kg dose without risk of toxicity and has chronotropic negative and hypotensive effects that could explain its use in traditional Gabonese medicine against high blood pressure.

Introduction:-

"Soft" medicine know considerable success in many parts of Africa. Surveys reveal that 80 to 85% of developing countries use medicinal plants for public health care (Organisation Mondiale de la Santé, 2002). The recourse of medicinal plants know up to this day a craze that could be explained by several reasons: The return to supposed natural products without adverse effects unlike conventional medicines; difficulties in accessing pharmaceuticals and their increasing costs; the importance given to medicinal plants by the pharmaceutical industry. Despite the place of antihypertensive drug products on the market, high blood pressure constitute up to this day public health problem whole world and in particular in developing countries. Today, high blood pressure has become a major

cardiovascular risk factor representing a public health problem for African populations. In Gabon, the prevalence is about 25 to 30% (Kearney et al., 2004). The Gabonese flora it is full still several species of plants little or not studied, but endowed with true pharmacological properties, it is the case of *Hallea ledermannii* still called *Mitragyna ciliata*. This medicinal plant belongs to the family Rubiaceae. It is very present in marshy areas. It is rich in alkaloids (Burkill, 1997). *Hallea ledermannii* is a large tree can reach 20 to 35 meters tall with a diameter rarely reaching 0.8 to 1 meter, cylindrical, and without thickening at the base. Gabonese population uses this plant in the treatment of female infertility, for douching as a local antiseptic and bark decoction in association with other plant species is administered as an enema in painful menstruation (Raponda-Walker et Sillans, 1961; Gassita et al., 1982; Wagner, 1986).

Material and Methods:-

Plant material:-

The trunk bark of *Hallea ledermannii* were harvested in Franceville, in the Province of Haut-Ogooué (South-Eastern of Gabon) in March 2014. Identification of the species was carried out at the Institute of Research in Tropical Ecology and deposited at the National Herbarium of National Center of Scientific and Technical Research (CENAREST) of Libreville (Gabon). The bark was dried at Laboratory of Natural Substances and Organometallic Synthesis (LASNSOM) at Department of Chemistry of the Faculty of Sciences of USTM (Franceville) protected from light and at ambient temperature (27-29 °C) during 5 weeks. The dry bark was crushed and preserved in bottles out of glass safe from the light and moisture for later analyses.

Animal material:-

The present study was carried out on male swiss albino mice aged 8 to 10 weeks and of weight including between 25 and 30 g and wistar albino rats from 12 to 14 weeks and of weight including between 250 and 350 g.

Alimentation and habitat of animals:-

The animals were supplied by the pet shop of the Faculty of Health Sciences of the Marien Ngouabi University where they were raised under natural aeration and lighting conditions. They were fed by a standard alimentation in the form of croquettes and were drinking *ad libitum* with drinking water.

Preparation of plant extract:-

The total extracts were prepared from the dry powder of the plant material. 100 g of powder were set to macerate in 1 L of solvent, respectively ethanol, water ethanol (500/500, v/v) and water, with magnetic stirring for 48 hours. The macerate was then filtered and then the solvent was evaporated to dryness under reduced pressure at 75 °C at help BÜCHI R-210 rotary evaporator. The extracts were concentrated and then kept in glass bottle for analysis.

Preparation of the aqueous extract:-

The aqueous extract was prepared by decoction from the dry powder of the plant material. 100 g of plant material powder were immersed in 1000 mL of distilled water. The mixture was heated with a hot plate with magnetic stirring for 30 minutes. After cooling, the extract was filtered and then the solvent was evaporated to dryness under reduced pressure at 75 °C at help BÜCHI R-210 rotary evaporator.

Phytochemical screening:-

The chemical characterization of the secondary metabolites contained in the plant extract was carried out according to the conventional methods described by Bouquet (1972). Thus, we carried out the tests of alkaloids (reactive of Dragendorff and Mayer), anthocyanins (HCl 20 %), anthraquinones (KOH 10 %), flavonoids (reaction to the cyanidin), triterpenoids (reaction of Liebermann-Bouchard), saponosids (foam index), gallic tannins and catechic tannins (ferric chloride, Stian), reducing compounds (reagent of Fehling) and carotenoids.

Phenolic content:-

The total phenolic contents of the different extracts were determined by the method of Folin-Ciocalteu (Singleton et Rossi, 1965). A quantity of 200 µL of the extract is mixed with 1 mL reagent of Folin-Ciocalteu coldly prepared (10 times diluted) and 0.8 mL sodium carbonate solution (7.5 %). The unit is incubated at ambient temperature during 30 min and the reading is carried out against a white using a spectrophotometer with 765 nm. All analyses were done in triplicate and results (average of triplicate analysis) are expressed in milligrams equivalent of gallic acid per gram of dry vegetable matter.

Flavonoid content:-

The content in flavonoids of the extracts was given by using the colorimetric method with aluminum chloride (Kim et al., 2003). A quantity of 100 μ L of the extract was mixed with distilled water 0.4 mL and thereafter with 0.03 mL sodium nitrite solution (5 %). After 5 min, 0.02 mL aluminum chloride solution (10 %) was added. One adds with the mixture 0.2 mL sodium carbonate solution (1 M) and 0.25 mL distilled water after 5 min with rest. The unit is agitated using a vortex and the absorbance was measured to 510 nm was recorded after 30 min of incubation. A standard calibration plot was generated using known concentration of quercetin. The results are expressed in milligrams equivalent of quercetin per gram of dry vegetable matter.

Acute toxicity:-

After three days of acclimatization in the laboratory, the mice were fasted for 4 hours before administration of the products without removing them from the water. Acute oral toxicity was assessed in accordance to the OECD Guideline n° 423 (2001). Five (5) batches of three (3) mice each were constituted and treated orally in the following manner: Control batches were treated at distilled water (0.5 mL/100 g) and the other batches treated at aqueous extract of *Hallea ledermannii* at the respective doses of 50, 300, 2000 and 5000 mg/kg. After administration of the products, each mouse was placed in an individual cage for ½, 1, 2, 3 and 4 h observations on spontaneous motricity, aggressiveness, responses to external stimuli, Stools, ptosis, piloerection, convulsions. Batch mortality was assessed within 48 hours of product administration. The body weight of each animal as well as food consumption were recorded every other day for 14 days (OECD, 2001).

Evaluation of cardiovascular effects:-**Anesthesia of the animal and catheterization of the femoral vein and the carotid artery:-**

The general anesthesia of the rats was carried out by intra-peritoneal injection of urethane 15 % at 1.5g/kg at the rate of 1 mL/100 g of rat body weight (Dimo et al., 2003). The anesthetized animal was fixed in dorsal decubitus, by means of pins planted on these legs on a cork board. The femoral vein and then the carotid artery were exposed and then catheterized, respectively, using fine polyethylene catheters attached to a syringe and introcan 24 G catheters as described by Etou Ossibi and al (2010). The 10 % heparinized NaCl (0.9 %) solution was injected at a rate of 0.1 mL/100 g by the femoral vein to prevent blood coagulation. When the clamp is removed, the blood engulfs into the catheter Introcan 24 G and transducer of type Biopac Student Lab MP 36 transmits the variations of the blood pressure at recorder of the same type that converts the waves into traces (records Blood pressure and heart rate) that can be viewed on the computer screen and whose values are read directly (Nguelefact, 2008).

Administration of the aqueous extract of Hallea ledermannii:-

After a period (about 30 min) of blood pressure stabilization, a physiologic solution of NaCl (0.9 %) and the aqueous *Hallea ledermannii* extract (10, 20 and 30 mg/kg) were administered to the normotensive rats (n = 5) at a rate of 0.1 mL/100 g. After administration of the products, their effects on systolic blood pressure and heart rate were observed for 30 minutes.

Statistical Analysis:-

The results were analyzed at help of the Excel and expressed as mean \pm ESM. Analysis of variance (ANOVA) was done for batch comparison. The difference between the batches was significant at least at the $p < 0.05$ threshold.

Results:-**Phytochemical screening:-**

The phytochemical screening was carried out from the total extracts to identify the main chemical groups present in the plant. Due to the results obtained, shown in table 1, it appears that the total extracts of *Hallea ledermannii* contain flavonoids, terpenoids, saponosides, cathechic and gallic tannins, anthraquinones, anthocyanins, alkaloids and reducing compounds. These plant extracts tested do not contain carotenoids.

Totals phenolic and flavonoid Contents:-

The results of the quantitative analysis of the total phenols and flavonoids are reported in table 2. The total phenol contents of the extracts are expressed in milligrams equivalent of gallic acid per gram of dry plant material (standard equation of the calibration curve: $Y = 0.0004X + 0.0053$, $R^2 = 0.9929$) and those of total flavonoids are expressed in milligrams quercetin equivalent per gram of dry plant material (standard equation of the calibration curve: $Y = 0.0005X + 0.0044$, $R^2 = 0.9963$). The polar extracts of *Hallea ledermannii* present low totals phenol and flavonoid

contents. Water-ethanol extract has the highest total phenol content (3.55675 ± 0.083 mg GAE/g of drug) and the total ethanolic extract in total flavonoids (1.2272 ± 0.197 mg Q E/g of drug).

Acute toxicity:-

The aqueous extract of *Hallea ledermannii* (50, 300, 2000 and 5000 mg/kg) does not modify spontaneous motility, reactions to external stimuli, stool condition, nor does it provoke aggressiveness, ptosis, piloerection, convulsions of mice. No mortality of mice was noted at the doses studied. The LD₅₀ is greater than 5000 mg/kg. Regarding the weight evolution, the results obtained show that the mice which received the aqueous extract of *Hallea ledermannii* gain weight compared to the control mice (distilled water). The weight gain of the mice is greater with the dose of 300 mg/kg (figure 1). The results of figure 2 show that the food intake in the mice treated with the aqueous extract of *Hallea ledermannii* at the different doses studied is greater compared to that of the control mice having received distilled water at 0.5 mL/100 g.

Effects of the aqueous extract of *Hallea ledermannii* on cardiovascular parameters:-

Intravenous administration of the aqueous extract of *Hallea ledermannii* (10, 20 and 30 mg/kg) causes a significant immediate decrease in systolic blood pressure respectively of 12.83 ± 1.33 (p <0.05); 21.86 ± 1.86 (p <0.01) and 27.37 ± 1.71 % (p <0.01) followed by rising and then permanently relapsing below the initial values from the 10th minute (figure 3). At these doses, significant decreases in heart rate are respectively 4.97 ± 1.63 (P > 0.05); 7.28 ± 1.17 (p <0.05) and 12.78 ± 1.93 % (p <0.01). In rats treated with the NaCl (0.9 %) physiological solution, immediate decreases in systolic blood pressure (SBP) and cardiac frequency (CF) are not observed (Figure 4).

Discussion:-**Phytochemical Screening:-**

Eight chemical families have been identified: alkaloids, anthocyanins, anthraquinones, flavonoids, terpenoids, saponosides, tannins and reducing compounds. The test carried out on the carotenoids was negative. *Hallea ledermannii* is therefore a medicinal plant rich in secondary metabolites. These results are in agreement with those obtained by Mibindzou (2004) and Souleymane (2004) on the bark of *Hallea ledermannii*, harvested respectively in Libreville (in the South of Gabon) and in the Region of Abidjan (Côte d'Ivoire). On the other hand, BIDIE et al (2011) mentioned the total absence of gallic tannins in the methanol extract of the *Hallea ledermannii* bark harvested in the central western forest region in the Issia department of Côte d'Ivoire. This difference in chemical composition could be explained by the environment, geographical origin and harvest period, drying time, climate, parasites and extraction method (Svoboda and Hampson, 1999).

Totals phenolic and flavonoid contents:-

The results of the quantitative study show that the polar extracts of *Hallea ledermannii* have of the low contents of total phenols and total flavonoids. Water-ethanol and ethanol extracts have the highest contents respectively of total phenols and flavonoids. These results are different from those obtained by Adeleke et al (2012), on *Hallea ledermannii* leaves harvested in Nigeria, with a high total phenol content (88 mg GAE/ g of drug). This difference is probably due to various conditions especially plant maturity, environment, organ used, place of harvest, drying time, extraction method, climatic and environmental parameters (Svoboda And Hampson, 1999).

Acute toxicity of aqueous extract of Hallea ledermannii:-

The study of acute oral toxicity shows that the aqueous extract of *Hallea ledermannii* does not modify the behavior or the general state of the mice. Also, this extract does not cause the death of the mice up to the dose of 5000 mg/kg. The aqueous extract of *Hallea ledermannii* is well tolerated and according to the System of Classification harmonized globally (GHS), the LD50 of this extract would be greater than 5000 mg/kg (OECD, 1998). Moreover, the results of the present study show that this extract causes an increase in the body weight of the mice and their feed intake compared to the controls (distilled water). The increase in food intake could be due to the stimulation of appetite by this extract. The weight gain of the mice which received the aqueous extract of *Hallea ledermannii* could be explained by their high food consumption. Indeed, it is reported that weight gain is proportional to food consumption (Guyton, 1989).

Effects of the aqueous extract of Hallea ledermannii on cardiovascular parameters:-

The aqueous extract of *Hallea ledermannii* causes immediate decreases in systolic blood pressure (SBP) and heart rate (HR) in normotensive rats. This extract therefore causes hypotension and a negative chronotropic effect. The negative chronotropic effect could in part explain the observed hypotensive effect of this extract. Indeed, it has been shown that the decrease in heart rate following the administration of plant extracts would be the cause of the drop in blood pressure (Etou Ossibi and al., 2010, 2014 and 2016). The rapid rise in systolic blood pressure could be explained by a reflex phenomenon consecutive the increase in the discharge of catecholamines (Guyton, 1989). Moreover, the presence of flavonoids, tannins and alkaloids in this plant could also explain the hypotensive activity of this extract (Souleymane, 2004; Bruneton, 1999). Previous studies have shown the vasculo-protective and vasodilating effects of polyphenols (flavonoids and tannins); effects involved in decrease blood pressure (Martin and Andriantsitohaina, 2002; Falleh and al., 2008; Xu and al., 2007).

Conclusion:-

Hallea ledermannii is a medicinal plant rich in secondary metabolites and well tolerated in mice with an LD50 greater than 5000 mg/kg. It is therefore relatively non-toxic and therefore can constitute a good drug for pharmacological studies. The abundance of phenolic compounds this plant, reputed as vasodilators, could justify its use in traditional Gabonese medicine in the treatment of high blood pressure. These preliminary results could be very useful in the search for new active medications capable of effectively fighting cardiovascular diseases. Subsequent analyzes will enable to highlight the molecules responsible for this hypotensive activity and study their action mechanisms.

Remerciements:-

We would like to express our sincere thanks to Mr. Michel LEMA, responsible of the Haut-Ogooué health tradipractitioners, and his team for advising us a medicinal plant commonly used in Haut-Ogooué to fight hypertension effectively.

Abstract

Groundwater is becoming a scant resource in part of Kollegal taluk, Chamarajnagar District, Karnataka State. This area receives an average annual rainfall of 696 mm. Groundwater has been the major sources of irrigation and drinking purpose for several years almost 80 percent of area is underlain by hard rocks. The study area is drought prone, most of the people in this area depend on groundwater for drinking water and agriculture. Therefore, constant monitoring and assessment of water resource is necessary. The study area is bounded by Yelandur and T. Narasipura Taluk to the west, Mandya and Bangalore to the North, and East and South it is bounded by Dharamapuri District of TamilNadu this area is located in the south eastern corner of Karnataka. The area is located between $77^{\circ} 51'$ to $77^{\circ} 30'$ East longitude $11^{\circ} 45'$ to $12^{\circ} 15'$ North latitude with an areal extent of 1026sq km covering 138 villages coming under the Survey of India Toposheet (SOI) numbers are 57 H/4, 57H/7, 57H/8,, 58E/1 and 58E/5. The study area comes under the semiarid region. In recent years, this region has been facing water scarcity as well as water quality problems. The major sources of employment are sericulture, agriculture and horticulture, engaging almost 70% of the workforce. Water samples have been collected from 68 locations of the study area, during the monsoon year 2016, The collected samples were analysed for chemical parameters. In the study area Ca-Mg-HCO₃ type of water predominates during the monsoon season of year 2016. On the basis of hydro-chemical facies classification the water is found to be suitable for irrigation. The other evaluated parameters are SAR, RSC, salinity sodium hazard and USSL Classification.

Introduction:-

Water is the most important commodity for all living things, in rural as well as urban areas. Because of increase, in agricultural and domestic activities, the demand is increasing. Quantity of water without quality is of no utility and hence chemical quality of water has gained equal importance along with quantity. The quality of any water may be altered due to over usage of fertilizers and other biogenic activity. The chemistry of host rock through which the groundwater flows below the earth surface and the total time of residence of the water with the host material control the chemistry of groundwater. The present study aims to obtain comprehensive information on the quality of

groundwater of Hanur Watershed which lies on South Eastern parts of Kollegal Taluk, Chamarajnagar District, Karnataka state, India. The study area comes under Southern Dry Zone-VI Groundwater samples were collected and analyzed for determining its quality in the laboratory.

Study Area:-

Hanur Watershed of Kollegal taluk, Chamarajnagar District is located in the south eastern corner part of Karnataka state between $77^{\circ} 51'$ to $77^{\circ} 30'$ East longitude $11^{\circ} 45'$ to $12^{\circ} 15'$ North latitude (**Figure 1**). It covers an area of 1026 sq.km. Groundwater is influenced by underlaying lithology, structures, soil types thickness and structure of rock formations. Weathered and fractured charnokites, hornblende/ampibolite schist form the main aquifer in Hanur watershed. Groundwater in the study area occurs under water table conditions in the weathered and fractured charnokites, hornblende/ampibolite schist (**Figure 2**); there is no perennial river in the study area. Most of the people depend on groundwater resource for their domestic and agricultural requirements, the major ion chemistry of groundwater of Hanur watershed has not been studied earlier. During the monsoon period in the year 2016, 68 Samples were collected from the different locations of the study area. The collected water samples were transferred into precleaned polythene container for analysis of chemical characters. Chemical analyses were carried out for the major ion concentrations of the water samples collected from different locations using the standard procedures recommended by APHA-1994. The analytical data has been used for the classification of water for utilitarian purposes and for ascertaining various factors on which the chemical characteristics of water depend.

Figure 1:- Location map of the study area.

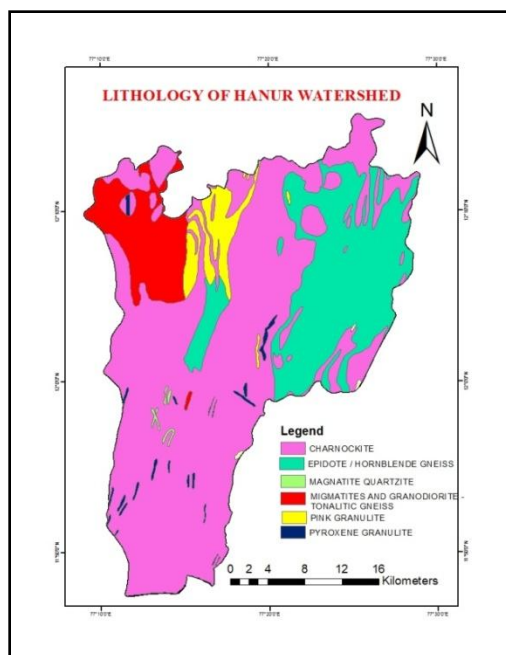

Figure 2:- Lithology of Study area.

Methodology:-

As stated earlier, 68 locations Groundwater samples were collected from Hanur watershed during monsoon period 2016 (**Figure 3**). The collected water samples were stored in pre-treated polythene bottles and transferred laboratory for analysis of major chemical elements - Ca^{+2} , Mg^{+2} , Cl^{-1} , HCO_3^{-1} , Na^{+1} , K^{+1} , and SO_4^{-2} . Using the standard procedures recommended by APHA-1994.

Figure 3:- Sample Location of study area

Results and Discussion:-

The Groundwater quality reveals that the pH varies from 6.28 to 9.4, EC ranges from 86 to 2670 $\mu\text{mho/cm}$, total dissolved solids(TDS) values range from 385 to 1926 mg/l, calcium varies from 20 to 179 mg/l, Mg varies from 14 to 109 mg/l, Na+k varies from 21 to 546 mg/l, Cl values range from 14 to 376 mg/l, Co3 values range from 0 to 93 mg/l, HCO3 values range from 152 to 646 mg/l, SO4 values range from 0.5 to 552 mg/l, NO3 values range from 0 to 62 mg/l in water of the study area. Chemical data of water samples are given in Table 1. Year -2016

Total Dissolved Solids:-

As groundwater moves and stays for a longer time along its flow path, increased in total dissolved concentrations and major ions normally occur (Norris et al. 1992). Higher TDS shows longer residence period of water (Davis and De Viest, 1966). TDS content is usually the main factor, which limits or determines the use of groundwater for any purpose (Nordstrom, 1987). The analysis of samples for the seasons has shown that there is a general tendency of increase of TDS, based on TDS, for various uses like general household, drinking, irrigation and understanding and it could be seen from the (table.1) that a majority of the portion is occupied by 500 to 1000 ppm TDS followed by <500 ppm concentration and finally >1000 ppm. During the stay or movement of the groundwater in the subsurface the TDS concentration slowly gets enriched and shown in figure 4.

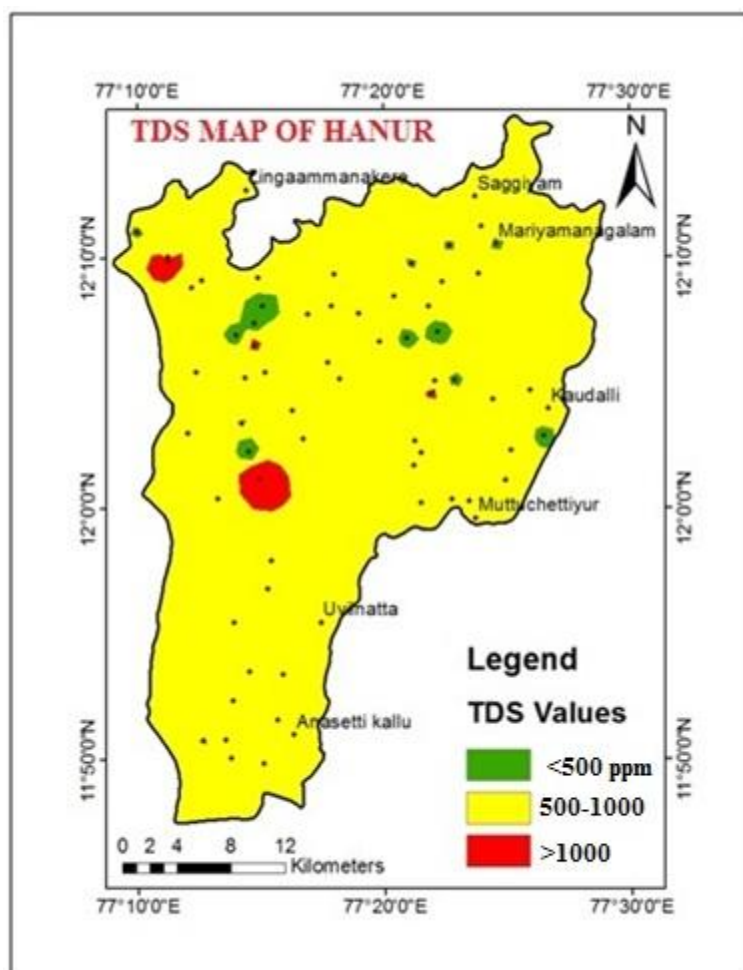

Figure 4:- Total dissolved solids of study area.

Hydrochemistry of Groundwater:-

Piper (1944, 1953) introduced a trilinear diagram which is used to evaluate the geochemical evolution of groundwater and relationship between rock type and water composition. Analysis of piper's trilinear plot shows that most of ground water samples are of Ca-Mg - HCO_3 type (Figure 5).

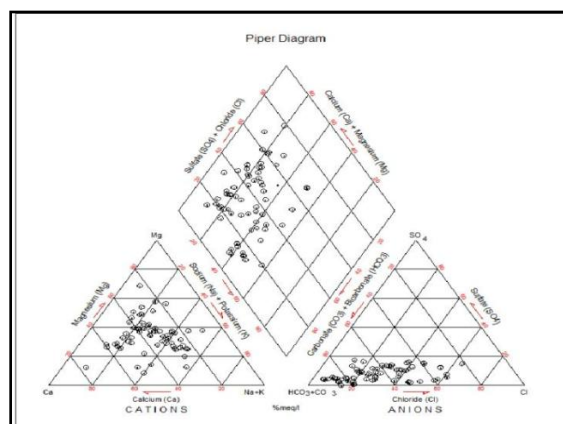

Figure 5:- Plotted in piper-Trilinear diagram.

Figure 6:- Classification diagram for anion and cation facies in the form of major –ion percentages. Water types are designed according to domain in which they occur on the diagram segments.

Legend:-

A- Calcium type, B- No Dominant type,
C- Magnesium type, D- Sodium and potassium type
E- Bicarbonate type, F- Sulphate type,
G- Chloride type

Hydrochemical facies are distinct zones that projects the dominating cation and anion concentration in water. To define the composition class, Back and co-workers suggested various sub divisions within the tri-linear diagram (**Figure 5**). The interpretation of distinct facies from the 0 to 10% and 90 to 100% domains, on the diamond shaped cation to anion graph, is more helpful than using equal 25% increments. It clearly explains the variations or domination of cation and anion concentrations. Groundwater Hardness is important parameters for water use and consumption. Hardness is caused primarily due to the presence of cations such as calcium and magnesium and anions such as carbonate, bicarbonate, chloride and sulfate in water. Wilcox classified groundwater for irrigation purposes based on % sodium and electrical conductivity. Eaton recommended the concentration of Residual Sodium Carbonate to determine the suitability of water for irrigation purposes. The US-Salinity Laboratory of the Department of Agriculture adopted certain techniques based on which the suitability of water for agriculture is explained. The sodium in irrigation waters is usually denoted as per cent sodium and can be determined using the following formula.

$$\% \text{Na} = (\text{Na}^+) \times 100 / (\text{Ca}^{2+} + \text{Mg}^{2+} + \text{Na}^{+1} + \text{K}^{+1})$$

That is the quantities of Ca^{2+} , Mg^{2+} , Na^{+} and K^{+} are expressed in milliequivalents per liter (epm).

Table 2:- Classification of water based on % sodium

%Na	Water Class	No. Samples	%	Sample Nos
Up to 20	Excellent	10	14.70	9,10,44,47,50,51,53, 65,66,67
20 - 40	Good	24	35.30	1,2,3,4,5,6,7,8,18,21,27,34,35,36,39,40, 42,43,48,49,58,59, 60,68
40 - 60	Permissible	30	44.12	11,14,15,16,17,19, 20,22,23,24,25,26,29,30,31,32,33,37,38,45,46,52,54,55,56,57,61,62,63,64.

Total		68	100	

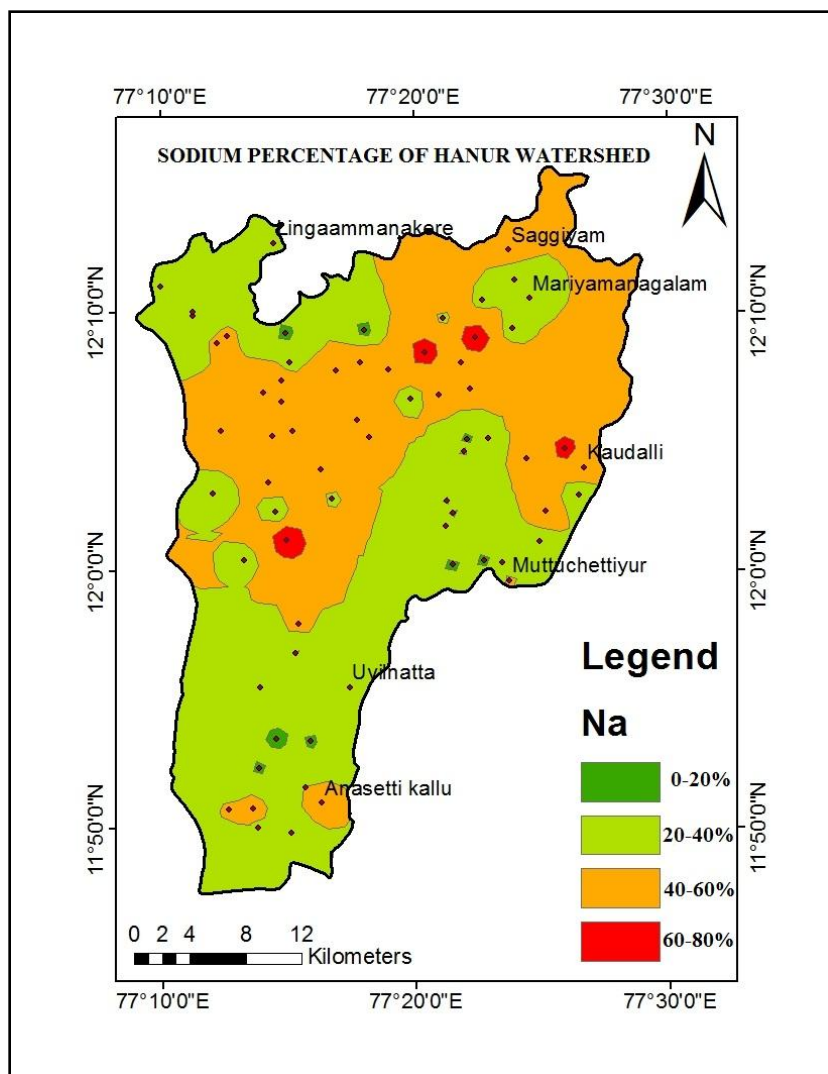

Figure.7 Sodium Percentage of the study area

Table 3:- Groundwater quality based on RSC (Residual Sodium Carbonate).

RSC (epm)	Water Class	No Samples	%	Sample Nos
< 1.25	Good	26	38.24	3,4,5,6,7,16,18,21,22,27,29,35,37,39,40,42,43,45,47,54,62,63,65,66,67, 68.
1.25 - 2.5	Doubtful	22	32.35	8, 11, 17,19,24,30, 33,34,36,44,46,48,50,51,52,53,55,56,58,59,61,64.
>2.5	Unsuitable	20	29.41	1, 2,9,10,12,13,14, 15,20,23,25,26,28,31,32,38,41,49,57,60.
Total		68	100	

The classification of groundwater samples with respect to per cent sodium is shown in (Table 2). It is observed that about 10 samples are excellent, 24 samples are good, 30 samples are permissible in this limit and 4 samples are doubtful. In waters having high concentration of bicarbonate, there is tendency for calcium and magnesium to precipitate as the water in the soil becomes more concentrated. As a result, the relative proportion of sodium in the water is increased in the form of sodium carbonate. RSC is calculated using the following equation.

$$\text{RSC} = (\text{HCO}_3^- + \text{CO}_3^{2-}) - (\text{Ca}^{2+} + \text{Mg}^{2+})$$

That is all ionic concentrations are expressed in epm.

Figure 8:- Residual Sodium carbonate of the study area.

According to the US Department of Agriculture, water having more than 2.5 epm of RSC is not suitable for irrigation purposes. Groundwater of the study area is classified on the basis of RSC and the results are presented in **(Table.3)**. Based on RSC values, out of 68 samples, 8 samples have shown values less than 1.25 and are safe for irrigation.

The most important characteristics of irrigation water in determining its quality are: (i) Total concentration of soluble salts; (ii) Relative proportion of sodium to other principal cations; (iii) Concentration of boron or other element that may be toxic, and (iv) Under some condition, bicarbonate concentration as related to the concentration of calcium plus magnesium. These have been termed as the salinity hazard, sodium hazard, boron hazard and bicarbonate hazard. In the past, the sodium hazard has been expressed as per cent sodium of total cations. A better measure of the sodium hazard for irrigation is the SAR which is used to express reactions with the soil. SAR is computed as where all ionic concentrations are expressed in epm.

$$SAR = \frac{Na^+}{\left\{ \frac{Ca^{2+} + Mg^{2+}}{2} \right\}^{1/2}}$$

Table 4:- Classification of Sodium Adsorption Ratio.

SAR	Water class	No. of Samples	%	Sample Nos
<1	Excellent	4	5.88	50,65,66,67
>1	Good	64	94.12	1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20, 21,22,23,24,25,26,27,28,29,30,31,32,33,34,35,36,37,38,39,40,41,42,43,44,45,46,47,48,49,51,52,53,54,55,56,57,58,59,60,61,62,63,64,68.
Total		68	100	

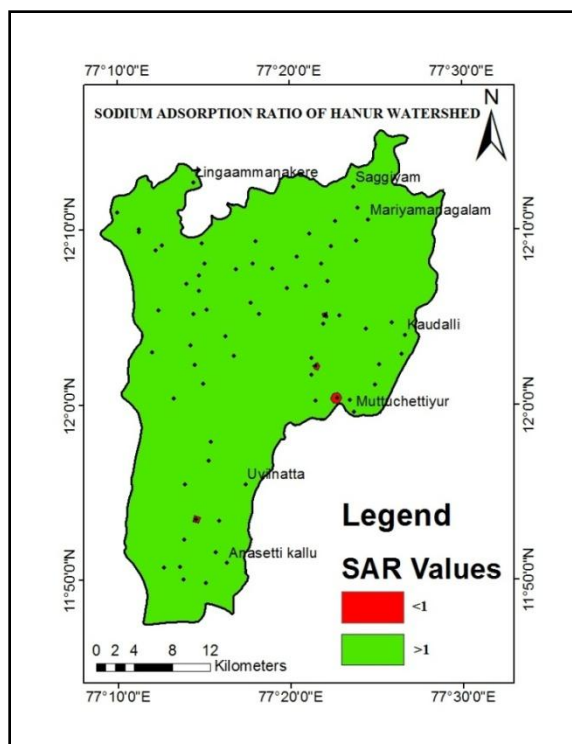

Figure 9:- Sodium Adsorption of the study area.

The classification of groundwater samples from the study area with respect to SAR is represented in (Table 4). The SAR value of all the samples are found to be less than 6, and are classified as excellent for irrigation. When the SAR and specific conductance of water are known, the classification of water for irrigation can be determined by graphically plotting these values on the US salinity (USSL) diagram (**Figures 10&11**). The groundwater of Hanur watershed is in general Ca-Mg-HCO₃ type during year 2016. About 88.24 % of the samples are grouped within C2S1 and C3S1 classes.

Figure 10:- Salinity Sodium hazard of study area.

Table 5:- Stastical data of Salinity Sodium hazard (USSL Classification)

Rank	Quality Parameter	No. of Samples	Percentage
1	C ₁ S ₁	1	1.47
2	C ₂ S ₁	21	30.88
3	C ₃ S ₁	39	57.36
4	C ₃ S ₂	4	5.88
5	C ₃ S ₃	1	1.47
6	C ₄ S ₁	1	1.47
7	C ₄ S ₃	1	1.47
Total		68	100

**Figure 11:-** USSL classification of water samples.

For the purpose of diagnosis and classification, the total concentration of soluble salts (salinity hazard) in irrigation water can be expressed in terms of specific conductance. Classification of groundwater based on salinity hazard is presented in Table 5. It is found from the EC value; only 2 samples are found to be unsuitable for irrigation purposes. **Table 5** shows the Salinity hazard classes. In the study area, the groundwater is generally Ca- Mg-HCO₃ type, which is mainly due to the geology of the area which comprises igneous rocks of crystalline nature, in which the major units are Charnokites and hornblende schist. Groundwater in the study area occurs under water table conditions in the weathered and fractured Charnokites and hornblende schist.

Table 6:- Comparison of the quality parameters of groundwater of the study area with WHO and ISI standard for drinking purpose.

S.N o.	Water Quality Parameters	WHO (1984)		ISI (1991)		No. of locations which exceed max. permissible limit (WHO)	Concentration in Study Area	Undesirable Effect Produced Beyond Maximum Allowable Limit
		Max Desirable	Max. Permissible	Max. Desirable	Max. Permissible			
1.	pH	7.0 to 8.5	6.5 to 9.2	6.5 to 8.5	No relaxation	1	6.28 to 9.4	Taste, effects mucus membrane and water supply system
2.	TDS mg/l	500	1500	500	1000	2	250 to 1926	Gastrointestinal irritation
3.	Ca mg/l	75	200	75	200	0	16 to 179	Encrustation in water supply, scale formation
4.	Mg ml/l	30	150	30	100	0	14 to 109	Encrustation in water supply and adverse effect on domestic use.
5.	Na mg/l	-	200	-	200	2	15 to 248	--
6	Cl mg/l	200	600	250	1000	0	14 to 322	Salty Taste
7.	SO ₄ mg/l	200	400	150	400	1	0.5 to 552.	Laxative effect.

Conclusions:-

- Ca-Mg-HCO₃ type of water predominates in the study area during the Year 2016,
- Though the suitability of water for irrigation is determined based on SAR, %Na, RSC and Salinity hazard, it is only an empirical conclusion. In addition to water quality, other factors like soil type, crop type, crop
- Pattern, frequency and recharge (rainfall), climate, etc. have an important role to play in determining the Suitability of water.
- Water that is not suitable based on the above classification may be suitable in well-drained Soils.
- The suitability of water for irrigation is evaluated based on SAR, %Na, RSC and salinity hazards. Most of
- the samples in Study area fall in the suitable range for irrigation purpose either from SAR, % Na or RSC
- Values.
- About 98% of the samples are grouped within C₂S₁ and C₃S₁ classes (Figures 10 & 11).
- Most of the samples in study area fall in the suitable range for irrigation purpose from USSL diagram.

Abstract

Disruptive classroom environment has been a worrisome problem challenging school systems in Nigeria. It is filled with high incidence of disruptive behaviors ranging from noise making, eating, sleeping, inattentiveness, playing, etc. The paper looks into the concept of disruptive classroom behavior, forms, causes and ways of ameliorating disruptive behavior. The study concluded that when teachers use better instructional programs, there will be producing academic progress. Finally the paper recommended among others that teachers should endeavor to manage their classroom activities effectively and build positive interpersonal relationship in students, use viable instructional approach which directs them to concentrate in other to avoid disruptive classroom behaviour, assess students properly and counsel them from displaying social misfits' attitudes.

Introduction:-

Disruptive classroom behavior is prevalent this 21st century. The school environment does not exist in isolation of the prevailing situations of insecurity inherent in the Nigerian context. Most disruptive behaviors that start from early school age sometimes lead to higher school age. Effective teaching and learning instruction will go down the drain without proper discipline of students. Huge investment in education according to Willy (2002) is not worthwhile without discipline. Training of a child goes hand in hand with discipline. Hence, formal education without discipline is worthless.

Disruptive behavior in the school systems has been identified as a challenge hindering a positive school environment. (Oliver, 2011). Disruptive behavior in the classroom affects the classroom environment as well as the educational experience for students enrolled in the course negatively. Disruptive behavior is referred as any behaviors that hamper instructors. Conducive classroom environment is the cornerstone of getting a good education and instilling discipline in students. Nakpodia (2010) stated that good behavior makes one to be relevant to the society. Classroom with incessant disruptive behaviors waste time and yield poor teaching and learning outcome. Continuing, a nation's building and behavior maintain peaceful environment for learning.

Conceptual Framework:-

Disruptive behavior obstructs teacher and instruction. Disruptive classroom behavior is the behavior which does not allow the teachers and students for sound teaching and learning process. Most often poses a hazardous low achievement trait for students. It is obvious that classroom with disruptive behavior have less academic engaged time. A teacher who is grossly inadequate in classroom management skills is probably not going to accomplish

much (Marzano, 2003). This empowered Borden (2013) to posit that disruptive behavior is associated with a wide range of cognitive, educational, constitutional, and family problems. Disruptive behavior in the classroom is one of the most serious challenge hampering effective teaching and learning environment especially in secondary schools due to lack of disciplinary measure for aggression and unpleasant situations.

Insecurity denotes varied phenomena; it entails distinct meanings ranging from: anxiety, fear, un-sureness, vulnerability, unsafe, danger, hazard and uncertainty. AkporRobaro, M. (2013) sees insecurity from two perspectives identified two types of insecurity. Beland (2005) connotes insecurity with absence of protection from crime and its consequential harm. From the aforementioned points one can describe insecurity as a psychological feeling of distress or threat to a person's life; the state of being vulnerable to danger. Insecurity this is the direct opposite of the term security.

Discipline is a very necessary condition for any venture to be successful. It is the training of an individual behavior in accordance with the rules of conduct. It is a systematic method of obtaining obedience in a person. It is the correction procedures for misbehavior. The free dictionary online describes discipline as the "training expected" (www.thefreedictionary.com/discipline). It is targeted to influence an individual actions and behavior positively. Students' discipline is the systematic application of school rules, punishments, and behavior. Students' discipline has been identified as one of the essential factors that foster practices and the main purpose of individual development. Creek School District, 2015). Students' discipline presupposes a positive learning environment. (Bodens, 2013).

Classroom environment encapsulates the physical class -"personality" of teachers. Classroom is known to yield effective teaching and learning experience which is cherished by the teacher and enjoyable by the students. Some of the ways of developing a healthy classroom environment include; building caring relationships amidst staff and students, rewarding academic excellence, provision of classroom rules and regulations, encouraging participatory / cooperative learning and counseling mal-adjusted students.

Causes of Disruptive Behavior in the Classroom:-

There are three main reasons which foster disruptive classroom behavior and they are; classroom related issues, personal issues and Social issues. Most often students seem to be unsecured, bored, uninteresting, confused, inattentive, annoyed, lost, asleep, resentful and not concentrating when they perceive that the teacher is not communicating effectively in carrying them along in the teaching and learning context. Personal problems of students ranging from anxiety, depression, eating disorders, attention deficit disorder, learning difficulties, emotional (www.ul.ie). Antisocial behaviors more or less influence their dispositions for teaching and learning outcome. More still, social issues which emanate from Factors outside the classroom such as; family breakdown, changes in the society, parents' role, schools' culture, teachers' education, schools' curricula, and examination points system pose a challenge to effective teaching and learning context.

Forms of Classroom Disruptive Behavior:-

There are different types of classroom disruptive behavior in secondary schools display by students and each one has negative impact on classroom management. Some of them include; entering classroom with screaming sound, eating in class, sleeping during teaching, and chatting with one another during when lesson is going on. Others are coming to classroom habitually late, unnecessarily arguing with teachers, bringing noisy electric devices in the classroom, shouting loudly to create thrill in classroom, sluggish wandering on veranda to distract students' attention and making complains against their fellow etc.

Effective Classroom Management Techniques:-

Management skills are crucial and fundamental. Effective classroom management establishes preventive techniques towards students' indiscipline rather than engaging in procedures. Effective Classroom management entails the establishment and maintenance of teaching simultaneously smoothly. Oliver (2011) pointed out that rules and routines are powerful preventive and powerful component to classroom organization and management plans and re-taught if inappropriate behavior occurs. Planning is a condition sine qua non for effective classroom management. (www.teqjournal.org/TEQ%20Website/Back%20Issue..)

Construction of Classroom rules is also an essential, powerful and preventive technique to effective classroom organization and management. They help to coordinate students, reinforced behaviors and consequences of inappropriate behavior. The rules should be minimal, precise and positively stated and so on (www.gtlcenter.org)

Classroom Arrangement is a condition sine qua non for effective classroom management and organization technique. It promotes order and decency for the smooth flow of teaching and learning experience. Dunbar (2004) in conformity suggested decongestion of high traffic areas and that good relationship with students should be maintained.

Constructive Discipline Techniques in Overcoming Disruptive Behavior in the Classroom:-

Motivation and communications are keys in overcoming disruptive behavior in classrooms. Others include teachers' techniques, protection of students' dignity, active listening and avoidance of confrontation. Corporal punishment should be totally avoided.

Conclusion:-

It is a hallmark of an effective classroom teacher to react positively to disruptive classroom behaviour or undesirable behaviors. Teachers should establish positive to classroom management and instruction, concentrate more on well planned and implemented instruction for it goes a long way in preventing classroom problems. They should ensure self-discipline so that students can be assisted to be disciplined in order for them to understand and appreciate the teaching and learning content. Finally, teachers will have to be effectively concerned with students' academic and social disposition and manage disruptive classroom behavior with caution.

Recommendations:-

The paper recommends that:

1. Teachers should endeavor to manage their classroom activities effectively and build positive inter-personal relationship in students.
2. They should use viable instructional approach which directs them to concentrate more on well planned and implemented instruction which prevents classroom problems.
3. Teachers should carry out proper assessment of students and elementary emotional disturbance.
4. The administrators should endeavor to renovate and improve dilapidated school physical facilities.
5. Government should provide adequate classroom spaces for proper accommodation of students to avoid crowdedness that gives room to classroom disruptiveness.
6. Government should also provide enough furniture for comfortable seating arrangements to avoid disruptive classroom behaviors that may arise from struggling for seats.
7. Teachers should embark on self-discipline in order to be a role model to the students under his/her control.

Bioactive composite granule, Calcium phosphate cement, periodontal endosseous defects.

Abstract

Background and objectives: This clinical study was carried out on 20 systemically healthy subjects to evaluate and compare, clinically and radiographically, the efficacy of Bioactive composite granule (Biograft-HABG Active) and Calcium phosphate cement (Biograft-CPC) in the treatment of periodontal endosseous defects clinically and radiographically and compare them.

Methodology: 20 intrabony defects present in 20 patients, who fulfilled the inclusion and exclusion criteria were selected and divided into two groups. Group I received bioactive composite granule, Group II received calcium phosphate cement. Clinical and radiological parameters such as Plaque Index (PI), Gingival Index (GI), Probing Pocket Depth (PPD), Clinical Attachment Level (CAL), Gingival recession (GR) and Depth of the bone defect (BL) were assessed at baseline 3, 6 and 9 months post operatively. The results were averaged for each clinical and radiological parameter at baseline, 3 months, 6 months and 9 months.

Results: Statistically significant difference in mean values of the plaque index, gingival index, pocket depth reduction, clinical attachment level, gain amount of defect resolution were observed in both the groups at subsequent time periods.

Conclusion: Clinical and radiographic assessments reveal that both bone graft materials were efficacious in the treatment of periodontal endosseous defects and have nearly comparable effects. However, long-term, multicenter randomized, controlled clinical trials will be required to discern the definite clinical and radiographic effects of these graft materials and to arrive at an explicit conclusion.

Introduction:-

Periodontitis, evoked by the bacterial biofilm (dental plaque) that forms around teeth, progressively destroys the periodontal tissue supporting the teeth, including the periodontal ligament, cementum, alveolar bone and gingiva (Darout et al, 2014). It is characterized by the presence of gingival inflammation, periodontal pocket formation, and loss of connective tissue attachment and alveolar bone around the affected teeth (Hanna et al, 2004). Several

therapeutic modalities have been considered to arrest the disease progression and to regenerate the lost tissue. Periodontal surgical procedures have focused on the elimination of hard and soft tissue defects (i.e., probing depths and osseous defects) by regenerating new attachment (Froum et al, 1998). Reconstructive modalities that appear to have merit and have demonstrated significant gain of clinical attachment include: surgical debridement with adjunctive root surface or wound conditioning, implantation of bone, bone derivatives and substitutes, and placement of barrier membranes for guided tissue regeneration (Becker et al 1999).

One of the best approaches to achieve periodontal regeneration is the use of bone replacement graft techniques, which are based on the concept of filling the infrabony defects with a number of grafting materials, including autografts, xenografts and alloplastic materials (Kasaj et al 2008). The objectives of periodontal bone grafts are: probing depth reduction, clinical attachment gain, bone fill of the osseous defect and regeneration of new bone, cementum and periodontal ligament.

Alloplasts are synthetic bone substitutes that are readily available and also eliminate the need for a patient donor site. BIOGRAFT -CPC is an osteostimulative and osteoconductive bioactive device used for grafting osseous defects. BIOGRAFT - HABG ACTIVE (Bioactive composite granule) are bioactive glasses composed of SiO_2 , CaO , Na_2O , P_2O_5 and bond to bone through the development of a surface layer of carbonated hydroxyapatite. It is thought that the bioactive properties guide and promote osteogenesis, allowing rapid and quick formation of new bone.

A paucity of studies comparing the effects of Bioactive composite granule (BIOGRAFT-HABG ACTIVE) with Calcium phosphate cement (BIOGRAFT - CPC) was noted, thus, this study was designed to evaluate and compare, clinically and radiographically, the efficacy of bioactive composite granule versus calcium phosphate cement in the treatment of periodontal endosseous defects.

Aims And Objectives:-

1. To evaluate clinically, the efficacy of Bioactive composite granule (BIOGRAFT -HABG Active) and Calcium phosphate cement (BIOGRAFT -CPC) in the treatment of periodontal endosseous defects.
2. To evaluate radiographically, the efficacy of Bioactive composite granule (BIOGRAFT -HABG Active) and Calcium phosphate cement (BIOGRAFT -CPC) in the treatment of periodontal endosseous defects.
3. To compare clinically and radiographically, the efficacy of Bioactive composite granule (BIOGRAFT-HABG ACTIVE) and Calcium phosphate cement (BIOGRAFT -CPC) in the treatment of periodontal endosseous defects.

Materials and Methods:-

Subjects and study groups:-

A randomized, longitudinal interventional study involving a total of 20 systemically healthy subjects, contributing to a total of 20 surgical sites was designed and conducted on a study population selected from the subjects visiting the out-patient section of the Department of Periodontics, D A Pandu Memorial R V Dental College, Bangalore. The ethical clearance for the study was obtained from the ethical committee and review board of the institution.

Patients aged between 25-55 years, who were systemically healthy and had no contraindications for periodontal therapy met the inclusion criteria. A patient was not considered eligible if gingival index score was >2.1 .

Two and combined 3-wall intrabony periodontal defects with a probing pocket depth (PPD) ≥ 5 mm, radiographic defect depth ≥ 3 mm were included in the study.

The 20 surgical sites were identified and were randomly divided into 2 groups; Group I and Group II.

The groups were:-

Group I (n=10): Those to be treated with Bioactive composite granule (BIOGRAFT-HABG ACTIVE).

Group II (n=10): Those to be treated with Calcium phosphate cement (BIOGRAFT -CPC).

Clinical and Radiographic Assessments:-

Oral hygiene status was assessed using Plaque Index (Sillness and Loe (1964)) and Gingival index (Loe and Sillness (1963)). Probing pocket depth (PPD), clinical attachment level (CAL), and marginal recession (GR) were measured to the nearest millimeter with a calibrated periodontal probe using an occlusal stent as a reference point for probe

placement. Occlusal stents for positioning measuring probes were fabricated with cold-cured acrylic resin on a cast model obtained from an alginate impression. Measurements were recorded from:

- ☐ Stent to cemento-enamel junction
- ☐ Stent to gingival margin
- ☐ Stent to deepest probing depth at test sites

Surgical Procedure:-

After local anesthesia, an intrasulcular incision aiming to preserve the papillae was performed. Mucoperiosteal buccal and lingual access flaps were then reflected. Granulation tissue adherent to the alveolar bone was removed to provide full access and visibility to the root surfaces. Any subgingival calculus was removed gently by using hand instruments. Defects in group I received Bioactive composite granule (BIOGRAFT-HABG ACTIVE) and defects in group II patients received Calcium phosphate cement (BIOGRAFT -CPC). Finally, the flaps were replaced and sutured appropriately with a 3-0 silk material using interdental suture technique. After a healing period of 10 days, the sutures were removed.

Postoperative Care:-

All patients received systemic antibiotic therapy for a period of 5 days postoperatively (amoxicillin 500 mg three times per day for 5 days). In addition, all patients were advised to avoid tooth brushing and hard chewing in the surgical areas and to rinse twice daily with a 0.2% solution of chlorhexidinedigluconate for 2 weeks. Recall appointments were scheduled every second week during the first 2 months after the surgical procedure, and all patients were recalled once a month for the remaining observation period.

Post-Surgical Evaluation and Review:-

Gingival Index (GI) and Plaque Index (PI) were re-evaluated at 3 months, 6 months and 9 months. Probing Pocket Depth (PPD), Clinical Attachment Level (CAL), Gingival Recession (GR) were also re-evaluated at 3 months, 6 months and 9 months using the previously used acrylic stents to provide a reproducible insertion axis. Depth of the defect was re-assessed at 3 months, 6 months and 9 months using digital radiography.

Results:-

Statistical test used included Kruskal Wallis test and Student unpaired t-test.

Clinical evaluation of post-surgical healing revealed a good soft tissue response to the combinations with no adverse complications. Both groups presented similar baseline characteristics in terms of PPD, GR, CAL, plaque index, gingival index.

All patients maintained a good level of oral hygiene and gingival status throughout the recall periods. Intergroup differences were found to be insignificant ($P > 0.05$) in terms of plaque index and gingival index (Table I and Table II).

At 9 months, all the groups presented a significant improvement in terms of PPD reduction and CAL gain (Table III and Table IV). The intergroup differences were found to be significant (Table III and Table IV). Gingival recession levels had also improved, however, the difference was not statistically significant (Table V).

Evaluation of the hard tissue findings indicated that all treatment modalities resulted in bone gain at 9 months in both groups (Table VI).

Discussion:-

The results of the present study show that treatment of intrabony defects with Bioactive composite granule (BIOGRAFT-HABG ACTIVE) / Calcium phosphate cement (BIOGRAFT -CPC) leads to significant PPD reduction, attachment, and radiographic bone gain compared to baseline values. Statistically significant differences in all of the investigated parameters were found between the treatments. Being alloplastic in nature, these graft materials do not increase the patient morbidity and do not require a second surgical site as in the case of autografts.

Approximately 60% of the bone graft substitutes currently available involve ceramics, either alone or in combination with another material. These include calcium sulphate, bioactive glass, and calcium phosphate. The use of ceramics, especially calcium phosphates, is driven in part because of the fact that the primary inorganic

component of bone is calcium hydroxyapatite, a subset of the calcium phosphate group. In addition, calcium phosphates are osteoconductive, osteointegrative (the newly formed mineralized tissue forms intimate bonds with the implant material), and, in some cases, osteoinductive. They often require high temperatures for scaffold formation and have brittle properties; therefore, they are frequently combined with other materials to form a composite. They may be porous or non-porous. Calcium phosphate compounds, currently most widely used in periodontal surgery are hydroxyapatite (HA) and tricalcium phosphate (TCP) (Pandit et al, 2010).

Bioactive glasses are composed of bone silicon dioxide (46 mole %), sodium oxide (24.4 mole %), calcium oxide (26 mole %), and phosphorous pentoxide (6 mole %) and bond to bone through the development of a surface layer of carbonated hydroxyapatite. It is thought that the bioactive properties guide and promote osteogenesis, allowing rapid and quick formation of new bone. Fetner et al in 1994 suggested that these materials have properties of superior manageability, hemostatic effects, and osteoconductive properties (Fetner 1994).

In a study by Lindhe et al, it was shown that, surgical procedures would induce loss of attachment if done in pockets shallower than 4.2mm (Lindhe et al, 1982). Hence, probing depth greater than 5mm was considered for the study. Laurell et al, in his study, has shown that, to benefit from regenerative procedures, depth of defect should be at least 3-4 mm (Laurell et al, 1998).

Probing Pocket Depth (PPD), Clinical Attachment Level (CAL) and Gingival Recession (GR) were assessed using a UNC 15 probe positioned along the grooves on a customized acrylic stent which was fabricated for each patient for providing a reproducible insertion axis for the probe. Similar technique has been adopted in other studies (Sharma, 2011; Subbaiah 2011, Sollazzo et al 2010).

Preoperative and postoperative comparability of probing measurements that do not use this standardized method may be open to question (Carranza, 2006). The depth of the angular bone loss was assessed to the closest 0.5 mm on the intraoral periapical radiograph taken using the paralleling cone technique with the radiographic grid in position which allowed for standardization. Other studies have also used this technique for assessment of bone defect and bone fill (Subbaiah, 2011; Cardaropoli, 2002).

The results of the study showed a statistically significant decrease in the plaque index and gingival index from baseline to 3 months, baseline to 6 months and at the end of 9 months in Group I as well as in Group II which is in accordance with the study conducted by Stein et al who used biphasic calcium composite grafting material in the treatment of human periodontal intrabony defects. However, no statistically significant difference was recorded between the two groups suggesting that all patients were very well motivated and there was a good maintenance of oral hygiene throughout the study in both the groups.

There was a statistically significant reduction in mean values of pocket depth and clinical attachment level at three months and six months in the two groups. These findings are in agreement with the results of Froum and Gupta (Froum et al 1998).

The mean amount of defect resolution from the baseline to three months and six months in all the groups was statistically significant. The mean percentage of defect resolution at three months and six months in the two groups was statistically significant. These results were in accordance with the study conducted by Meffert and Pepelassi.

Conclusion:-

Clinical and radiographic assessment reveal that treatment with bioactive composite granule and calcium phosphate cement both are efficacious in the treatment of periodontal endosseous defects. These two appear to have nearly comparable effects, treatment with both bioactive composite granule and calcium phosphate cement improve the healing outcomes regarding probing depth reduction, CAL gain, and bone fill. However, long-term, randomized, controlled clinical trial and histomorphometric studies employing a greater number of patients will be needed to arrive at a definitive conclusion.

Introduction:-

Chiari 1 malformation has been approximately diagnosed in 1% to 4% of patients undergoing brain or cervical spine magnetic resonance imaging (MRI) studies,^{1,2}. Chiari malformation type 1 (CM-1) is a common and often debilitating neurosurgical condition. In recent years, there has been a growing emphasis on outcomes research, including efforts to compare the results of various surgical approaches.^{3,4} To help facilitate more objective comparisons, several groups have produced and/or validated different metrics to evaluate treatment outcomes.⁵⁻⁸ However, despite this growing interest in improved research methodology, evidence-based guidelines for surgical intervention are undefined. The decision to treat CM-1 surgically may be based on a variety of considerations, such as anticipated syrinx improvement and stabilization of spinal cord damage, as well as the risk of postoperative complications. The objective of this study was to use clinical and neuroimaging features to predict long-term patient-reported Quality of life outcomes in patients undergoing posterior fossa decompressions.

Methods:-

Patient population:-

This study is an analysis on the 28 patients evaluated and managed in our department of Neurosurgery in Govt Stanley medical college hospital, Chennai for Chiari 1 malformations between 2011-2016. The study was proceeded following the approval from the ethical committee from our institution and consent from the patients. All patients had a detailed neurological examination followed by MRI scans of the brain with whole spine screening to evaluate the clinical presentations. Chiari 1 malformation patients had been graded based on the chiari severity index and underwent posterior fossa decompression with lax duroplasty.

Data collection:-

Preoperative signs and symptoms were recorded on admission. These findings were subsequently grouped into 3 categories 1) classic Chiari headaches (including occipital, Valsalva-induced, posttussive, and exertional headaches), 2) atypical presentation (frontotemporal headaches; and poorly localized headaches) 3) myelopathic predominant. We defined myelopathic symptoms as numbness, weakness, hyperreflexia, or unsteady gait.

Radiological analysis with MRI craniovertebral junction was used mainly to analyse the extent of descent of cerebellar tonsils and the size of the syrinx. In addition to these, we recorded the following neuroimaging parameters potentially related to CM-1 pathology: (1) tonsillar ectopia, as the perpendicular distance from the tip of the cerebellar tonsil to McRae's line^{9,10}; (2) clivus-canal angle, as the angle between

Wackenheim's clivus baseline and the posterior C2 vertebral body line¹⁸; (3) dens angle, as the angle formed by a line through the C2 synchondrosis and a line through the odontoid tip measured from the posterior aspect of the C2 vertebral body¹¹; (4) pB-C2, as the perpendicular distance between the ventral dura and a line joining the basion to the inferoposterior C2 body^{17,19,20}; (5) obex position, as the distance between the obex and foramen magnum (basion-opisthion line)¹²; and (6) basilar invagination, as present when the tip of the dens was 5 mm above the Chamberlain's line.¹¹ We defined a syrinx as a contiguous spinal cord cavitation measuring at least 3 mm in maximum diameter on T2-weighted MRI.

Outcome assessment:-

We evaluated patient-defined outcome as improved, stabilised and worsened on the basis of postoperative follow up during the reviews. Any improvement from the presenting complaints was considered as IMPROVED. Stabilised was defined as non-progression of complaints following the procedure. Any worsening of symptoms was to be taken as WORSENERD.

Results and Discussion:-

Out of the total of 28 patients undergoing posterior fossa decompression for Chiari 1 malformation, the mean age of presentation was 24.5 years. 13 patients were male and 15 were female. Headache was the presenting complaint in all the 28 patients with classical chiari type of headache in 24 and atypical presentation like generalised or fronto temporal headache in 4 patients. Features suggestive of myelopathy were seen in 14 patients. Scoliosis was present in 4 patients and Charcot's joint in 4 patients (as shown in table 1). Radiological findings found were syringomyelia in 14 patients, interhemispheric cyst in 2 patients, corpus callosal agenesis in 4 patients, block vertebra involving C2C3 in 1 patient and hydrocephalus in 3 patients (as shown in table 2).

Based on these presentations, clinical grading was done as grade 1 – typical presentation, grade 2 – atypical presentation, grade 3 – predominance of myelopathic features. Table 3 shows the distribution of patients based on the clinical grading. Radiological grading was done on the basis of syrinx. If the diameter of the syrinx was greater than 6mm, it was grade B and if it was less than 6mm or absent, it was considered as grade A as shown in table 4.

Patients were graded in to 3 based on chiari severity index. Grade 1 as clinical grade 1, Grade 2 as clinical grade 2/3 + radiological grade A, Grade 3 as clinical grade 2/3 + radiological grade B. There were 14 patients in grade 1 of chiari severity index, 4 patients in grade 2 of chiari severity index and 10 patients in grade 3 of chiari severity index. All the patients underwent posterior fossa decompression with removal of posterior arch of C1 with lax duroplasty. The 3 patients with hydrocephalus underwent ventriculoperitoneal shunt procedure followed by PFD. Postoperatively, csf leak was observed in 1 patient, aseptic meningitis in 1 patient, pseudomeningocele in 3 patients and hydrocephalus in 1 patient. Postoperative period was uneventful in 22 patients.

Postoperative outcome categorised as Improved (18 patients 64.2%), Stabilised (9 patients 32.1%) and worsened (1 patient 0.35%) as shown in table 5.

Conclusion:-

Posterior fossa decompression with lax duroplasty despite its complexity of the procedure is safe and effective way of reducing the symptomatology of chiari malformations with a lesser complication rate.

MhaswadYatraMahotsav, crackers, noise pollution, monitoring Sites.

Abstract

The unwanted or disturbing sound is called as noise. This reported study shows noise quality of firing the crackers at “MhaswadYatraMahotsav- 2016”, which held every year at Mhaswad, Dist. Satara in Maharashtra. The noise level due to bursting of crackers is measured by using standard method. For present study ten different sites were selected as noise monitoring sites on “Palakhi Marg” and noise of crackers was noted at ten different timings with the interval of half an hour in each recording. The result concluded that, in the residential zone and silence zone at night condition, the noise level exceeded the prescribed standard level of 65 dB as per the Noise Pollution (Regulation and Control) Rules, 2000.

In the present study, the average noise level at all the recorded timings was found to be above the prescribed limits of Central Pollution Control Board (CPCB).

Introduction:-

Noise pollution is a major concern throughout the world. Noise pollution in different areas is coming from wide variety of sources. Noise is an unpleasant and unwanted sound which is indeed annoying and harmful too. Its effects are more directly on the receiver i. e. Man. It is said that “you may forgive noise but your body will never” (Agrawal and Yadav, 2013). Noise pollution damagingly affects the human being leading to loss of hearing as well as mental stress (Jhanwar, 2016). Although noise pollution is not fatal to human being but its effects cannot be overlooked. Noise causes stress reactions, increased blood pressure, sleep disorders, some hormonal changes and general quality of life (Bhat, 2003). The effect of noise has been studied in humans by different workers (Belojevic *et al*, 2008; Babisch, 2000 and 2005; Lundberg, 1999). At present noise pollution is considered to be one of the key problems that has numerous hazardous effects on environment which deals with cost of society (Martin *et al*, 2006).

Indian festivals are traditionally celebrated by song and dance in large groups. During festival loudspeakers, bursting of crackers produce intermittent and high frequency impulse noise (Concha-Barrientos *et al*, 2004). Diwali is an important festival when lot of crackers are used in almost every part of the country (Singh and Joshi, 2010). Mhaswad is famine and low rainy area which is traditionally known for Lord Siddhnanthyatra. This yatra festival is celebrated for one month starting from ‘laxmipoojan’ of Diwali and ends in kartik month of Marathi year. This yatra is a celebration of marriage ceremony of God Siddhnanath and Goddess Jogeshwari. Traditionally there is a faith that when God and Goddess pass in their “palakhi”, citizens are trying to stop that “palakhi” in front of their houses. To stop the “palakhi” peoples are using to burst the fire crackers and thus there is a competition in the peoples for bursting crackers. Traditionally it is called as “Diwali Maidan”.

Corresponding Author:-Jadhav Sujeet.

Address:- Dept. of Botany, S. B. R. College Mhaswad, Tal. Man, Dist. Satara.

In the present investigation, an attempt has been made to monitor the noise created by bursting of crackers in “Diwali Maidan”.

Working Area:-

The present work has been carried out at the “Palakhi Marg” at Mhaswad City, Tal. Man, Dist. Satara. This “Palakhi Marg” begins from Shri Siddhanth Temple and passes from main market area and ends back to Shri Siddhanth temple.

Material and Method:-

The present study was conducted at ten different timings during the “Palakhi Marg” in “Diwali Maidan”. The ambient noise level was monitored with the help of sound level meter during 8 pm to 12.30pm. Precaution was taken to avoid echo or resonance of sound by selecting suitable distance from the crackers. Readings were taken after every half an hour interval. Ambient sound levels were compared with that of the standards prescribed in the Environment Act, 1981 and standards of CPCB (Tripathi, 1999). As well as the noise limits given by, The Noise Pollution (Regulation and Control) Rules, 2000 were used to compare the noise levels in areas under study.

Table 1:- Noise standards for ambient noise level

Sr. No.	Area Code	Category of Area/ Zone	Sound Level Limit at Day Time (dB)	Sound Level Limit at Night Time (dB)
1)	A	Industrial Area	75	70
2)	B	Commercial Area	65	55
3)	C	Residential Area	55	45
4)	D	Silence Zone	50	40

Source: Lad *et al* (2012)

Result:-

The results of ambient noise pollution monitored in the YatraMahotsav at Mhaswad have been summarized in table 2.

The ambient noise level noted at all the monitored sites was very high as per given by the CPCB. The “Palakhi Marg” is having silence zone, which is also showing ambient noise level more. The highest ambient noise level recorded was 104.2 at 12.30 am which is very high than the recommended noise level at night.

Table 2:-Noise level in different zones of “Palakhi Marg” at Mhaswad city in “Diwali Maidan”.

Zone	Names of the sites	Time	Sound level (dB)
Residential	Mhaswad Main Peth	9.00 pm	99.2
		9.30 pm	97.5
		10.00 pm	103.4
Silence	Hospital and Bank	10.30 pm	96.1
		11.00 pm	102.6
		11.30 pm	95.9
Residential	BajarPeth	12.00 pm	94.3
		12.30 am	104.2
		1.00 am	92.7
		1.30 am	98.8

Graph 1:-Showing ambient noise level at different timings during “Diwali Maidan”**Discussion:-**

In the present study, the average noise level at all recorded timing was 98.47 dB which is found to be above the prescribed limits of CPCB (Central Pollution Control Board, New Delhi) during the “Yatra Mahotsav” day at 2016. This average recording of ambient noise level at residential and silence zone during night conditions is very high. In the beginning of “Palakhi” noise level is above the average which is slightly declined in the silence zone but again inclined at residential zone at last phase.

According to Mishra *et al* (2017), the ambient noise level increased due to different human activities during Bhopal VigyanMela 2016. The study report of Patel and Bhawe (2014), shows increased noise level due to bursting of crackers during diwali festival. The noise level during festive and non-festive days in Haridwar city were measured and compared by Sharma and Joshi (2010) which is found to be very high during Diwali season. At different parts of Meerut city on the night of Diwali festive, noise pollution was studied by Singh and Joshi (2010), which shows extreme ambient noise level during Diwali. A study report of Pathak *et al* (2008) showed traffic noise became main reason of headache, high BP and other stresses among the peoples in the working places at Varanasi city. In Bareilly metropolitan city, the noise level was slightly higher than the prescribed limit of the Central Pollution Control Board (Gangware *et al.*, 2006).

Conclusion:-

The present study is an attempt to assess the level of ambient noise pollution during the particular day of “Diwali maidan”. Peoples in the residential area were suffered from this high levelled noise pollution. Noise pollution affects and damages the human being leading to loss of hearing as well as mental stress. Efforts are made through this article to make the citizens aware about the preliminaries of noise pollution and its hazardous effects.

Recommendations:-

- Proper supervision should be followed to make sure that cracker seller in and around Mhaswad, following the noise standards set for crackers.
- There should be ban on noisy crackers during “Yatra Mahotsav” in and around Mhaswad.
- A separate area to be made available to the peoples for firing of crackers by the municipal corporation.
- The time limit should be given for bursting of the crackers which should be strictly followed by the citizens.

Abstract

Fusion of medical images such as MRI and PET by gradient selection is attempted in this paper. The efficiency of the fusion process depends on the selection of the appropriate image geometry. This work analyses different gradient geometries for medical image fusion. From the experimental analysis, it is found that the images fused by the Southwell geometry produced better results when compared to Fried geometry and Hudgin geometry.

Introduction:-

Image fusion integrates information from multiple individual images into a single image so that the obtained image contains more details of the source images. In static image fusion, it is necessary that the input images are aligned and there exists coincidence in terms of depth or field of view of the imaged scenes. Image registration is done to make the images suitable for static image fusion [1]. Image fusion algorithm can be classified into pixel-based and regional-based algorithm [2]. In pixel-based methods, each pixel of the input images are combined using various rules such as averaging, finding maximum to form corresponding pixels in the fused image [3]. In region-based techniques, wavelet transforms are used to represent the input images in a multi-resolution framework, and then each region of the image is applied a different fusion rules that are used to desegregate the information into a more comprehensive image [4].

Medical image fusion [5] aids in the clinical diagnosis and treatment by providing useful information especially for lesion location, making treatment and pathological study. MRI image gives information about anatomical structure of soft tissues such as brain, organs and blood vessels [6,7], while PET image suffers from low resolution but provides physiological information [8]. Hence fusion of these two images offers the advantage of better diagnosis of diseases [9] particularly of the cancer tumours.

Socolinsky and Wolff proposed an image fusion approach in which the information from a multi-spectral image dataset is integrated to produce a one band display of the image. They generalize image gradients are those which closely related to image contrast [10], by defining it for multi-spectral images in terms of differential geometry. The desirable gradient field is reconstructed using the contrast information, to produce the fused image. Later, Wang *et al* fused the images in gradient domain using weights dependent on local variations in intensity of the input images [11]. At each pixel position, they construct an importance-weighted contrast matrix.

The algorithm proposed by Sujoy Paul *et al* combines gradient fusion as well as pixel-based fusion [12]. It works for the fusion of colour or grayscale image for multi-focal, multi resolution [13] and multi-exposure [14] images. In the

case of colour images, the luminance and chrominance of the images are fused in a different manner. By doing so the computational time for running the algorithm is greatly reduced. Also, due to the fact that the luminance (Y) channel represents the image brightness and contrast information and it is in this channel where variations and details are most visible, since the human visual system is more sensitive to luminance (Y). The chrominance (Cb,Cr) [15] channels contain only colour information, to which the human visual system is less sensitive. Comparison between Hudgin, Fried, Southwell geometries proved the advantage of each for noise reduction. Roopashree *et al* reported that the fried geometry produced worst performance, as its consistency is poor [16].

In this paper, the fusion of the medical image using the gradient selection is proposed. The quality of the image is analyzed by using different geometry. The performance assessment test such as Structural Similarity Index (SSIM), and Peak Signal to Noise Ratio (PSNR) are used for testing the accuracy of the fusion process.

Materials and Methods:-

The static image fusion requires input multi-modal images of same size and in the same depth of view. Hence input image must be registered before processing [17]. Here, pre-registered MRI and PET images are taken for further processing.

Fig. 1:- Steps involved in the evaluation of gradient geometry for medical image fusion

The input images are taken from www.med.harvard.edu. The Fig. 1 explains the gradient selection process. Initially, luminance channel is separated from each of the images. From that the gradients are selected using various geometries such as Hudgin geometry, Fried geometry, Southwell geometry. After fusion of images using any reconstruction [18] algorithm, the parameters PSNR and SSIM are calculated for each fused image. Finally, the performance of the fused image is compared and analyzed.

Fusion technique proposed by Sujoy paul *et al* for colour image the luminance part is separated from the chrominance part (RGB to YCbCr) as different fusion technique is followed for each. Gradient fusion is carried out

for luminance channel. This involves taking the gradients with the maximal magnitude at each pixel position will lead to an image which has much more detail than any other image in the stack. Luminance channel for N input images are stored in a stack as $I'=\{I_1, I_2, \dots, I_N\}$ where $N > 2$. The gradient value for each image is found for each pixel position using Hudgin geometry. Those values are taken mean with the neighbouring pixels and are made equivalent for the gradient for the respective pixels which is the Southwell geometry explained later in this paper. The gradient of the luminance channel of an image may be $\Phi_n^x(x, y)$ and $\Phi_n^y(x, y)$ where Φ_n^x and Φ_n^y are the gradient components along the x and y directions respectively.

The magnitude of the gradient may be

$$H_n(x, y) = \sqrt{((\Phi_n^x(x, y))^2 + (\Phi_n^y(x, y))^2)} \quad (1)$$

The magnitude of gradient at all the pixel positions of each image is compared with that of the other images and the maximum value of that is stored as

$$P(x, y) = \max_{1 \leq n \leq N} H_n(x, y) \quad (2)$$

The fused luminance gradient is

$$\Phi^x(x, y) = \Phi_{p(x, y)}^x(x, y) \quad (3)$$

$$\Phi^y(x, y) = \Phi_{p(x, y)}^y(x, y) \quad (4)$$

where $\Phi^x(x, y)$ and $\Phi^y(x, y)$ are the values of gradient components in the x and y gradient components of the image with index $P(x, y)$ at pixel location (x, y) and the fused luminance gradient is $\Phi = [\Phi_x \Phi_y]^T$. The relationship between the fused gradient (Φ) and the luminance channel (I) is $\nabla I = \Phi$, where $\nabla = [d/dx, d/dy]^T$.

As the fused gradient is a combination of multiple luminance channel, there are possibilities for high peaks in the adjacent pixels. Hence it needs to be optimized using poisson solver which satisfies the zero curl condition to remove artifacts. The reconstruction of the luminance channel from the gradient data is done with a wavelet based algorithm proposed by Haar-Hampton et al followed by image enhancement using gamma correction. The fusion procedure for grayscale images is the same as followed for the luminance channel.

For chrominance part, the individual chrominance channels (C_b, C_r) are taken and the fusion is carried out by taking the weighted sum, with the weights depending on the channel intensities of input chrominance channels. Their values will range from 16 to 240. For grayscale images this process does not apply as they have values of both C_b and C_r equal to 128. The weights must be selected for pixel positions such that how far the chrominance value is from 128. Computation is less intensive than gradient fusion.

Concept of Geometries:-

Local gradients are measured at discrete locations of the wavefront. Depending on the position at which phase differences are estimated with reference to the location of slope measurements, there exist three main classifications in wavefront sampling namely Fried, Hudgin and Southwell (or Shack Hartmann) geometries. The illustration of relationship between the slope and phase measurements for the above geometries are shown in fig(1).

Fig.2:- Sampling Geometry (a) Fried (b) Hudgin (c) Southwell

The horizontal and vertical lines represent positions of slope measurements in x and y directions respectively and dots represent positions of phase estimation. The difference between the geometries are shown in Fig.2. In Fried and Southwell configurations both x and y slope measurements are made at the same point. In the Southwell (Shack Hartmann) configuration, slope measurement points coincide with the phase evaluation points whereas in Fried configuration, phase evaluation grid is displaced by half the sensor pitch with respect to slope measurement grid. In Hudgin geometry, x and y slope measurement points are displaced from one another and phase is evaluated at the edges of the slopes [19]. The slope to phase relation for different configurations are as follows

For Fried geometry,

$$\Phi_n^x(x, y) = \frac{\left[\frac{\Phi_{(x+1,y)} + \Phi_{(x+1,y+1)}}{2} - \frac{\Phi_{(x,y)} + \Phi_{(x,y+1)}}{2} \right]}{h} \quad (5)$$

$$\Phi_n^y(x, y) = \frac{\left[\frac{\Phi_{(x,y+1)} + \Phi_{(x+1,y+1)}}{2} - \frac{\Phi_{(x,y)} + \Phi_{(x+1,y)}}{2} \right]}{h} \quad (6)$$

Where $x = 1, 2, \dots, N-1$ and $y = 1, 2, \dots, N-1$.

For Hudgin geometry,

$$\Phi_n^x(x, y) = \frac{\Phi_{(x+1,y)} + \Phi_{(x,y)}}{h} \quad (7)$$

$$\Phi_n^y(x, y) = \frac{\Phi_{(x,y+1)} + \Phi_{(x,y)}}{h} \quad (8)$$

Where $x = 1, 2, \dots, N-1$ and $y = 1, 2, \dots, N$.

For Southwell geometry,

$$\frac{\Phi_n^x(x+1, y) + \Phi_n^x(x, y)}{2} = \frac{\Phi_{(x+1,y)} + \Phi_{(x,y)}}{h} \quad (9)$$

$$\frac{\Phi_n^y(x, y+1) + \Phi_n^y(x, y)}{2} = \frac{\Phi_{(x,y+1)} + \Phi_{(x,y)}}{h} \quad (10)$$

Where $x = 1, 2, \dots, N$ and $y = 1, 2, \dots, N-1$.

Any of the above geometries can be applied to find the gradient values from the input images each producing different quality of fused image when the gradient data is used for reconstruction.

Image Quality Assessment Tests:-

(i) PSNR:

The Peak Signal to Noise Ratio (PSNR) can be computed by calculating MSE (Mean Square Error).

It can be calculated by squaring the intensities of original input images and the final output image[20]. Then the average is taken. It is given by

$$MSE = \left(\frac{1}{NM}\right) \sum_{m=0}^{M-1} \sum_{n=0}^{N-1} e(m,n)^2 \quad (11)$$

Where $e(m,n)$ is the error difference between original and distorted images. PSNR is obtained as the pixel difference between the reconstructed and the original image. It is given by

$$PSNR = 10 \log \frac{S^2}{MSE} \quad (12)$$

where $S=255$ for images having 8-bit.

(ii)SSIM:

The Structural SIMilarity Index (SSIM) is a method for measuring similarity between two images. The SSIM index can be viewed as a quality measure in which the fused image is compared with the image that is considered as perfect quality [21]. Its formula is given as

$$SSIM(x,y) = \frac{(2\mu_x\mu_y + C_1)(2\sigma_{xy} + C_2)}{(\mu_x^2 + \mu_y^2 + C_1)(\sigma_x^2 + \sigma_y^2 + C_2)} \quad (13)$$

Results and Discussion:-

The fusion of medical images (MRI and PET) based on gradient approach is presented in this paper. The gradient approach is done only to Luminance channel. The input gradients are taken using three different images such as Hudgin geometry, Fried geometry, Southwell geometry. Among these three methods Southwell geometry provides the best PSNR and SSIM values. The comparison among the geometries for five different cases are given below.

In Table 1, the normal brain images from MRI and PET are taken and fused using three different geometries. From the fused image of Fried geometry it is shown that the local features of the input images are not obtained clearly. The fused images of Hudgin geometry and Southwell geometry seem to be similar, but the parameters PSNR and SSIM is high for Southwell geometry compared to Hudgin geometry.

In Table 2, the PSNR value of fused image of Fried geometry is very much lower compared to Southwell geometry. While considering Fried geometry, there are more undesirable artifacts and so it is better to use Southwell geometry. SSIM of Southwell geometry is also greater to some extent when compared with other geometries. It can be seen that the tumour is more clearly visible in Southwell geometry image.

In Table 3, the twists and turns of the brain tissues are clearly visible in the fused image of Southwell geometry. But they are not visible in Fried geometry. Southwell geometry is having PSNR and SSIM value very much better than Fried geometry. SSIM value of Southwell geometry is nearly 100 times better than Fried geometry.

In Table 4, Carcinoma is visible more obvious in the fused image of Southwell geometry. Noise ratio and similarity index are higher when compared to other two geometries which may result in better diagnosis of the disease.

In Table 5, Similarity index is very poor in Fried geometry. The features of the original images are not clearly visible. It will be difficult for doctors to diagnose.

Conclusion:-

This work has demonstrated the fusion of MRI and PET images using Gradient Selection method. The luminance channels of MRI and PET are taken and the gradients are selected using three geometries namely Hudgin geometry, Fried geometry, and Southwell geometry. The performances of the three geometries are analyzed using the parameters PSNR and SSIM. Based on the comparative analysis, it is found that the Southwell geometry provides better results for fusion of MRI and PET images.

Abstract

India is a synonym with a wide range of diversity. Even in the state and union territories, which have been carved out based on culture and lingual communality, witnessed a marked variation in the economical socio-cultural background communality distinct. The rural consumers are not always “distant cousins” of the urban fold. They have their distinct personality and independent thinking based on the strong set of beliefs and values. Thanks to television and developments in transportation, today, a customer in a rural area is quite literate about the countless products that are on offer in the market place. The sector is excited about burgeoning rural population whose incomes are rising and which is willing to spend on goods designed to improve lifestyle. Also with near saturation and cut throat competition in urban India, many producers of FMCG are driven to chalk out bold new strategies for targeting rural consumers in a big way.

Introduction: -

The Indian Fast Moving Consumer Goods (FMCG) industry began to get shaped during the fifty years. The FMCG sector is a cornerstone of the Indian economy. This sector touches every aspect of human life. Indian FMCG market has been divided for a long time between the organized sector and unorganized sector. Unlike the US market for FMCG presents a tremendous opportunity for makers of branded products who can convince consumers to buy branded products. FMCG refers to consumers' non-durable goods required for daily or frequent use

With the liberalization and growth of the Indian economy since, the early 1990s, the Indian customer witnessed an increased exposure to new domestic and foreign products through different media. Apart, from this, social changes such an increase in the Indian consumers' personal consumption.

Generally, a consumer buys FMCG goods at least once in a month. This sector is considered as the lucrative sector with a total market size of around Rs. 52,000 crores. In any country, the good performance of FMCG segment reflects the growing incoming level among the consumers. At the beginning of the privatization process in our country, many MNC's had given priority to FMCG sector.

Objectives: -

The objectives of the study are as follows

- ❖ To understand the socio-economic profile of the respondents
- ❖ To study the perception of respondents on FMCG products.

Scope of The Study: -

Rural consumers have customs and behavior and marketers may find it difficult to serve them as they are mostly equipped with urban-based marketing skills. This study has confined its scope in understanding the level of awareness about FMCG products, examine the purchase pattern of selected FMCG products, the purchase decision taken by the rural consumers. In addition, it also analyses the factors influencing the same. Further this study also takes into consideration regarding the perception of respondents on FMCG products and their level of satisfaction towards them.

Limitations of The Study: -

The study is based on the opinion of the sample respondents from rural area of Coimbatore district. All possible efforts have taken to see all the respondents reveal the true facts and figures and what they feel about selected FMCG products.

- ❖ The present study deals with some selected FMCG products via Washing powder, Toilet soaps and Health drinks. It has not covered the entire FMCG products.
- ❖ Only individual consumers have been chosen as sample respondents.
- ❖ The study has covered only the rural parts such as Chettipalayam, Aalaandurai, Iruttupallam and Madhampatti which is in the interior parts of Coimbatore district.
- ❖ The study is based on the feedback of the respondents. It always calls for credibility issues.
- ❖ The result may not be generalized to other villages.

Review of Literature: -

- ❖ Purba Basu (2004), explains the need of understanding the rural consumers among the marketers and fine tune of their strategy to reap benefits in the coming years except a few life styles based products which depends mainly on urban India. The greatest hindrance to reap the opportunities in rural India is understanding the consumer behavior.
- ❖ Nandha and Chinnaiyan (2003) found that product quality was the first factor influencing the brand preference of soft drinks in the rural areas of Tamil Nadu followed by the availability and retail price. Rural price, advertisement, word of mouth and retail shop keepers are the other factors which influence the brand of soft drinks in the study area.
- ❖ Dhillon et al., (1999) identified that the number of all durable goods possessed by urban home makers was more than the rural ones. The desire to acquire the latest model of durable goods and to enhance the works efficiency for reducing the drudgeries of daily household chores were found the major factors for replacement of durable goods for both the rural and urban home makers.
- ❖ Keshav et al., (2002) found the rural consumers believed in joint buying decisions making in consultation with the elders and the ladies of the house. However, the youngsters purchase items of their personal use as per their own independent buying decisions. Advertisement with rural culture and regional / local language attracted the audience. All the respondents felt strongly about their customs and traditions. The respondents were aware of their availability of the products. They preferred quality to price.
- ❖ Ghosh (2007), pointed out in his study on, "FMCG companies in rural Indian Markets", that there are key challenges for FMCG companies who are penetrating the rural markets, which include infrastructure issues like poor distribution system, improper logistics of the fragmented rural market, given the heterogeneity of the Indian population. The companies who understand these challenges and tune their strategies accordingly will surely be the winners in the years to come, taking advantages of this economic boom in the rural sector in India.
- ❖ Samuel (2005), in his study on rural consumer behavior towards selected non-durable goods in Coimbatore district, revealed that the rural people change their tastes and preferences in procuring non- durable goods, the purchase decision pattern and consumption of certain non- durable goods in the daily market.
- ❖ Ambika (2007), revealed in her study that advertising itself cannot sell the product. It cannot sell the product of poor quality, product which is too costly or items which do not come up to the expectations of the consuming public. The product that we use in day to day life like butter, potato chips, tooth paste, household care products, packaged food and beverages etc.,

Methodology: -

- ❖ The study has used values based on primary data which has been collected from the individual respondents using interview schedule.
- ❖ Convenient sampling method was adopted to collect the responses from 200 respondents who are the individuals purchasing household care products, personal care products and food & beverages at various POP outlets including grocery stores, weekly market, nearby stores and medical shops located in the rural areas of Coimbatore.
- ❖ The data collected have been analyzed with SPSS package based on the objectives of the study.
- ❖ The statistical tools applied for the studies are
 - Simple percentage analysis
 - Garrett ranking

Analysis and Interpretation: -**Table 1: -Socio - economic profile of the respondents**

Particulars	Variables	No.	%
Age	Below 20 years	41	20.5
	20-25	34	17
	25-30	34	17
	30-35	22	11
	Above 35	69	34.5
Educational Qualification	Illiterate	21	10.5
	School Level	111	55.5
	College Level	47	23.5
	Professional	21	10.5
Occupation	Business	44	22
	Agriculture	29	14.5
	Employee	46	23
	Professional	18	9
	Others	63	31.5
Marital Status	Single	66	33
	Married	134	67
Family Type	Joint	56	28
	Nuclear	144	72
Family Size	2 Members	4	2
	3 Members	40	20
	4 Members	56	28
	5 Members	54	27
	Above 5 Members	46	23
Family Income	Below Rs. 5000	58	29
	Rs. 5000 – 10000	55	27.5
	Rs. 10000 – 15000	57	28.5
	Rs. 15000 – 20000	15	7.5
	Above 20000	15	7.5

It is observed from the above table that among the total respondents,

- ❖ Majority of the respondents belongs to the age group of 35 years and above.
- ❖ Majority of the respondents have studied up to school level.
- ❖ Majority of the respondents have other occupations.
- ❖ Majority of the respondents are married.
- ❖ Majority of the respondents belong to nuclear family
- ❖ Most of the respondents have 4 members in their family.
- ❖ Majority of the respondents earn up to Rs.5000.

Perception of respondents on FMCG products: -**Table 1: -** Perception of Respondent on Washing powder

Quality	Score		Rank
	Total	Mean	
Removes stain	11175	55.88	5
Washes well in any water	12087.5	60.44	2
It washes more clothes	12162.5	60.81	1
Consumes less water	11512.5	57.56	4
Easy to handle	6000	30	7
Non-allergic	10225	51.13	6
Keeps the clothes fresh	12062.5	60.31	3
Good fragrance	4175	20.88	8

Interpretation: -

It is seen clear from the above table that among the perception on FMCG- washing powder, the perception 'Washes more clothes' has secured the higher mean score and stood at the top, followed by 'Washes well in any water' received the secured second place, 'Keeps clothes fresh' stood at third by securing the highest mean score, 'Consumes less water' stood at fourth, 'Removes stains' stood at fifth, stood 'Non allergic' at sixth, 'Easy to handle' stood at seventh and finally, 'Good fragrance' has secured last score and stood at last.

Majority of the respondents prefer washing powder because of it washes more clothes.

Table 2: - Perception of Respondents on Toilet Soap

Quality	Score		Rank
	Total	Mean	
Good cleaning	10887.5	54.44	3
Good for skin	10337.5	51.69	4
Good fragrance	6387.5	31.94	7
Easy availability	13137.5	65.69	1
More lather	100337.5	50.19	5
More refreshing	9287.5	46.44	6
Low price	7087.5	35.44	8
Brand image	12812.5	64.06	2

Interpretation: -

It is seen from the above table that the perception of the respondents on Toilet soaps, the perception on 'Easy availability' has secured higher mean score and stood at the top, followed by 'Brand Image' has secured next higher at second place, 'Good cleaning' has secured next higher score and stood at third, 'Good for skin' stood at fourth, 'More lather' stood at fifth, 'More refreshing' stood at sixth, 'Good fragrance' stood at seventh and finally, 'Low price' has secured last score and stood at last. Majority of the respondents prefer toilet soaps keeping in mind of its availability.

Table 3: -Perception of Respondents on Health Drinks

Perception	Score		Rank
	Total	Mean	
Flavor	8237.5	41.19	3
Taste	7612.5	38.09	6
Color	7550	37.75	7
Refreshment	7175	35.88	8
Smell	8587.5	42.94	1
Packing	7837.5	39.19	5
Brand image	8075	40.38	4
Durability	8375	41.88	2

Interpretation: -

It is understood from the above table that the perception of respondents on Health drinks, perception under FMCG category, 'Smell' has secured higher mean score and stood at top, followed by 'Durability' has secured next higher and stood at second, 'Flavor' has secured next higher score and stood at third, 'Brand image' stood at fourth, 'Packing' stood fifth, 'Taste' stood sixth, 'Color' stood seventh and finally, 'Refreshment' has secured last score and stood at last.

Majority of the respondents prefer health drink because of its smell.

Suggestions: -**❖ Price Reduction**

The study revealed that people with formal education give top priority to price of products. Being a low involvement product of regular purchase, the prices of personal care products may be reduced by avoiding unnecessary expenditures, instead of frequent price discounts and extra quantity offers which disturbs the brand loyalty.

❖ Need for more products research

The women consumers who increasingly dominate the decision making and consumption of FMCG products having increasingly started looking for specialized products to offer customized solutions to their needs. This requires increased thrust on product research and innovation.

❖ Promotion and distribution

The FMCG players need to concentrate on increased consumer awareness through advertisement campaigns, new brand advertisement, free samples and expansion of franchisee network.

Conclusion: -

It is concluded from the study that FMCG sector is growing and shall continue to grow very fast. The future for the FMCG sector looks extremely encouraging. This sector having undergone a structural change is all set to emerge stronger in future.

One of the greatest achievements of the FMCG industry has been the 'sachets', which helped companies to introduce the product in small package size, at lower price points, to reach new users and rural consumers to expand the market share for value-added products in India.

The FMCG market remains highly fragmented with almost of the market representing unbranded, unpackaged home-made products, who can prompt consumers to use their branded products. If the suggestions given in the study is carried out by the FMCG, then the sector will not only grow by 50% in the forthcoming year, but also grow to newer heights soon.

Abstract

Les cryogels lignocellulosiques ultra poreux sont reconnus comme des matériaux fonctionnels, en raison de ses différences qualitatives dans les propriétés, la densité et la porosité, et diverses compositions chimiques. Les fibres de lin sont très prometteuses car elles présentent une résistance mécanique élevée, une stabilité chimique, une biodégradabilité, et une non-toxicité sont constituées principalement par de cellulose (72%). Les cryogels lignocellulosiques ultraléger et très poreux sont préparés par dissolution des fibres de lin dans un mélange de solvant à base de 1-éthyle-3 méthylimidazolium (EMIMAc) et de Diméthylsulfoxyde (DMSO). Le biomatériau à base de lin brute présente des propriétés texturales, morphologiques et cristallines remarquables. La dissolution des fibres de lin dans l'EMIMAC / DMSO est partielle, par contre, sa dissolution dans les mêmes paramètres avec de l'EMIMAc pur a été parfaite, et aucun trace des fibres observée par microscopie optique et image morphologique.

Introduction:-

Les politiques actuelles de synthèse des matériaux se basent sur trois grands principes: le respect de l'environnement et des hommes, la réduction des déchets et des matières polluantes et le remplacement partiel ou total des dérivés pétrochimiques par des ressources renouvelables lignocellulosiques. Ainsi, la valorisation de la biomasse lignocellulosiques est favorisée par deux facteurs. D'une part, l'industrie des matières plastiques doit faire face à une diminution des dérivées pétrochimiques, d'autre part à une prise de conscience grandissante des populations de l'impact des matériaux plastiques sur notre environnement (dégagement de CO₂). Alors des stratégies connues pour convertir la lignocellulose en matériaux poreux impliquant différentes étapes d'élaborations suivies par des traitements chimiques sont recommandé. Parmi ces stratégies nous avons pensé à la solution suivante : La synthèse des matériaux poreux sans recours à des traitements chimiques.

C'est pour cela que nous avons pensé à une matière lignocellulosiques brute qui sera traité par le procédé que nous allons décrire. L'utilisation des matières primaires lignocellulosique pour la fabrication de produits respectueux de l'environnement a généré beaucoup d'études, avec différentes étapes nécessaires pour l'obtention d'un produit tel que

Tous les axes de recherche sont d'une grande importance dans le domaine de la lignocellulose. Cependant, une attention particulière a été donnée aux aspects d'accessibilité de la Fibre de lin. Il est à noter que cette fibres est mondialement connue, elle est utilisé actuellement pour la fabrication des plusieurs bio composites (les chaises, les cadres de lunette...).

D'autant plus, beaucoup des procédés chimiques qui sont utilisés pour séparer la cellulose et l'hémicellulose de la biomasse lignocellulosique, car la lignine molécule très solide, sont à la fois lourds et coûteux. Nous tenons à préciser qu'aucun travail n'a été effectué dans ce domaine en utilisant la dissolution des fibres de lin brute dans l'EMIMAc/DMSO.

Dans cet article nous résumons les différentes étapes de synthèse et caractérisation que nous avons suivie pour atteindre notre but.

Etudes experimentales :-

Materiels et produits chimiques:-

Nous avons utilises:-

- Des fibres de lin de longueur 0.5 mm de la part de Dehondt-France,
- Un liquide ionique : 1-Éthyle-3-méthylimidazolium acétate 97% (EMIMAc, Sigma-Aldrich) ,
- Un co-solvant : Diméthyle sulfoxide (DMSO),
- Des coagulant non solvant : de l'eau dé-ionisée et de l'acétone absolue
- Tous les réactifs ont été utilisés tels que reçus sans aucune purification.

Procedes De Préparations Des Solutions Lin/EMIMAc-DMSO (80-20):-

Etapes de prétraitement et dissolution des fibres de lin:-

Nous avons séché les fibres de lin avant dissolution à une température de 50°C sous vide pendant 2 heures, à fin d'éliminer tous trace d'eau adsorbé. Puis ces fibres ont été dissoutes dans un mélange EMIMAc/DMSO (80/20) en poids à 70°C pendant environ 124 heures sous agitation magnétique de 500 rpm. Les rapports des fibres de lin: solvant mixte étaient 1:99, 2:98 et 3:97 (% masse / masse). Les solutions ont été respectivement marquées comme FL1, FL2 et FL3.

Enfin, lorsque des solutions colorées, homogènes et visqueuses ont été obtenues, une centrifugation des solutions obtenues a eu lieu pour bien séparer la phase gel de la phase non dissoute. En fin ces solutions ont été stockées à température ambiante et protégées contre l'absorption d'humidité.

Etapes de Régénération:-

L'acétone et l'eau dé-ionisée ont été utilisées comme non-solvants pour les bains de régénérations. Les solutions obtenues ont été versées dans des tubes en polypropylène, puis de l'acétone pure y a été ajouté soigneusement. Ce mélange a été mis au repos pendant 6 jours pour favoriser la diffusion solvant co-solvant. Ces solutions pré-régénérées obtenues ont été recouvertes de l'acétone périodiquement changée (4 fois/jour) pendant 10 jours. Une étape de changement de non solvant a eu lieu après la régénération des solutions dans l'acétone, dans des tubes en polypropylène remplie d'eau bi-distillées pendant 48h à fin de remplacer tous traces d'acétone par celui de l'eau. Durant cette mise en forme la teneur en solvant dans les solutions FLX(x : 1, 2 ou 3 % en Fibres de lin) varie de très important lors de la dissolution, elle passe à très faible lors de la fin de régénération.

Etapes de Séchage: Lyophilisation:-

Tous les échantillons ont été séchés à 40 mTorr et -80 ° C pendant 48h dans un lyophilisateur (Cryotec Comos 80). Après la lyophilisation, on obtient des cryogels de dimensions définies. Les cryogels LIN/EMIMAc-DMSO ont été marqués comme CF01, CF02 et CF03, respectivement.

Caractérisations:-

Des observations microscopiques ont été effectuées après avoir placé les fibres de lin en contact avec le solvant mixte entre deux lames de verre, par un microscope optique métallographique inversé (Olympus PMG3) de hautes résolutions. Les photos d'agrandissement 500X ont été prises par un logiciel Archimed.

Aussi les mesures rhéologiques en écoulements des solutions de Fibre de lin/EMIMAc-DMSO ont été effectuées sur un rhéomètre Bohlin Gemini équipé d'une géométrie cone-plan (4°-40mm) et d'une platine Peltier pour le contrôle

de la température. La dépendance de la viscosité en fonction du taux de cisaillement pour les solutions de cellulose (Lin)/EMIMAc a été enregistrée à températures fixes de 0 à 100°C, par incrément de 5°C.

Pour savoir si ces travaux ont eus des résultats nous avons procédé par une spectroscopie infrarouge à transformée de Fourier (ATR-FTIR, Spectrum Two Perkin Elmer), pour étudier la composition initiale des fibres et les cryogels. Le traitement spectroscopique a été enregistré dans la gamme de longueur d'ondes de 4000-500 cm^{-1} . Les échantillons ont été balayés 10 fois avec une résolution spectrale de 4 cm^{-1} .

D'autre par, la morphologie des échantillons métallisés a été examinée au microscope électronique à balayage (SEM Zeiss Supra 40 FEG) à une tension d'accélération de 3 kV.

Tandis qu'aux surfaces spécifiques des Cryogels (SBET) ont été calculées selon la théorie de Brunauer-Emmett-Teller (BET), en utilisant des isothermes d'adsorption-désorption d'azote (ASAP 2020, Micromeritics) à -196 °C.

Les densités apparentes des échantillons ont été mesurées en utilisant le pycnomètre à poudre Geopyc 1360 de Micromeritics.

La synthèse ainsi que les caractérisations des échantillons ont été étudiées au centre de mise en forme des matériaux, l'école supérieur des mines de Paris, Sophia Antipolis-Nice, France.

Résultats Et Discussion :-

Gonflement et dissolution des fibres de lin : vue microscopique:-

Dès le début et par différents grossissement nous avons remarqué que le système lin/solvant a provoqué un gonflement des fibres de lin. Plus précisément avec l'analyse microscopique, il s'est avéré que ce gonflement est en réalité un ballonnement sous forme de chapeler de petit ballon (Fig.1).

En effet les fibres de lin gonflent de façon homogène, le solvant mixte réagit comme agent gonflant. Le mécanisme de gonflement et de dissolution est identique à celui de la cellulose dans les liquides ioniques [4]. Cela indique que le processus de dissolution des fibres de lin brute n'est pas contrôlé uniquement par la nature chimique du solvant mais également par la qualité lignocellulosiques de la matière (72% de cellulose dans le lin).

Fig. 1. Gonflement des fibres de lin dans EMIMAC/DMSO

Les paramètres clé influençant les phénomènes de gonflement et de dissolution des fibres de lin sont liés à leur composition lignocellulosiques, la structure morphologique et le degré de polymérisation élevés ($DP = 9000$) [5]. Après 10h de traitement sous agitation magnétique à température égale à 70°C, les ballons ont commencé à éclater, pour favoriser la dissolution et la formation d'une matière visqueuse.

Ce prétraitement permet une solubilisation quasi-totale de la lignine (coloration brunâtre des solutions) et des hémicelluloses avec le temps. Le degré de polymérisation (DP_{lin}) et le taux de cristallinité de la cellulose du lin sont aussi diminués. Les fibres de lin, composées majoritairement de la cellulose (72%) [6], elles prennent majoritairement les mêmes caractéristiques de gonflement que celui de la cellulose. Il a été rapporté que se phénomène a été déjà étudiée pour le coton et les fibres de bois [7], en liquide ionique avec quelques grammes de DMSO suivent la même séquence de dissolution suivant quatre phases :

- Phase 1: Ballonnement,
- Phase 2: Éclatement du ballon,

- Phase 3: dissolution des sections non ébouriffées (Rupture),
- Phase 4: dissolution des restes de membrane des ballons.

La structure supramoléculaire des polysaccharides de lin est détruite d'une façon irréversible par l'effet des paramètres de dissolution (solvant, température, temps de réaction et agitation).

Fig. 2. Rupture des fibres au cours d'agitation

L'intérêt des liquides ioniques dans le cadre de notre étude repose sur leurs remarquables capacités à dissoudre des composés lignocellulosiques ou polymériques brutes, polaires ou non polaires, organiques ou inorganiques. Il a ainsi été montré que certains liquides ioniques pouvaient dissoudre des polysaccharides telles que la chitine [9] et la cellulose [10].

La rupture (Fig.2) n'apparaît jamais de façon brutale mais elle se déroule progressivement après que la fibre ait subi des étapes de gonflements successifs. Les fibres se déchirent peu à peu, suite à des efforts d'agitation et de température (Fig.2). La rupture des fibres de lin ne se déroule pas facilement. Elle se manifeste sous l'effet d'un phénomène de fatigue, après une certaine accumulation du cisaillement et des contraintes dans les liaisons internes des composées lignocellulosiques du lin.

Néanmoins, des solutions parfaites des polymères dissous totalement sont rarement observables même macroscopiquement. Ce pendant lorsque nous n'avons pas utilisé le co-solvant « DMSO » nous avons obtenues une dissolution parfaite. Ce qui montre que ce co-solvant entrave la perfection de dissolution.

Courbes d'écoulements:-

Généralement le comportement rhéologique des solutions dépend largement de la nature de la matière qui les constitue (la concentration et de la température). La Figure 4 présente les courbes d'écoulement des solutions de lin qui se comportent comme des gels très visqueux après l'étape de dissolution.

Fig. 3. Courbes d'écoulement des fibres de lin DANS EMIMAC/DMSO.

Il est à noter aussi qu'à concentration et à température faible (1% massique, 20°C), nous obtenons des courbes de tendances linéaires (courbe noire), ainsi que pour des valeurs de températures élevées quel que soit le degré de

concentration. Par contre pour un degré de concentration élevé et une température faibles nous avons obtenues courbes présentent un comportement Newtoniens.

L'augmentation de pourcentage de lin conduit à une augmentation progressive de viscosité. De plus l'influence du DP des fibres de lin sur la viscosité élongationnelle est aussi très importante pour des faibles déformations. Cela corroborait, par plusieurs travaux antérieur, qui ont montré que la viscosité est très importante [11], si le DP est plus élevé (degré de polymérisation de lin égale a 9000) [5].

Caractérisations texturales des cryogels:-

La lyophilisation produit des cryogels hautement poreux et à faible densité mais à un effet destructeur sur la structure du réseau sur tout pour les concentrations massique faibles (pour une concentration massique de 0,5g en fibres de lin l'échantillon sa tient pas malgré la dissolution totale du lin).

Fig. 4. Courbes de densité et de surface spécifique des cryogels en fonction de la concentration massique de fibre de lin.

L'augmentation de la concentration en fibres de lin à toujours pour conséquence la densification du réseau (Fig.5), et une diminution de porosité et de la surface spécifique des cryogels de lin. La porosité des cryogels synthétisées a été aussi déduite par les images morphologiques.

Morphologies des cryogels de lin:-

La morphologie des échantillons lyophilisés a été examinée par MEB (Fig.6). Les échantillons cryogels ont été étudiés en morphologie à l'intérieur et à la face supérieure pour les trois concentrations déjà mentionné.

Fig. 6:- Les images morphologiques de coupes intérieures et la surface supérieur des cryogels CF01, CF02 et CF03.

Les faibles grossissements permettent de discerner un réseau poreux à l'intérieur et un réseau solides avec apparition des traces des fibres de lin non dissoutes à la surface supérieur des cryogels (Fig.6). A ce niveau de grossissement, on peut distinguer la haute porosité des cryogels élaborées ainsi que les zones plus foncées (noir), qui doivent correspondre à du vide, donc vraisemblablement à un réseau poreux des matériaux.

La formation du réseau poreux apparaît pour les différentes concentrations des fibres de lin. On peut distinguer que pour une concentration égale à 1% en masse de lin (1 : 99) le réseau n'a aucune structure ordonnée (zone feuilleté et zone fibrillaires), par contre pour celui de 2% en masse un réseau poreux se présente sous forme des feuilles, attachés les uns aux autres. Le réseau poreux feuilleté se densifie avec l'augmentation de la concentration pour former un réseau poreux de structure ordonné en nid d'abeilles de parois poreux.

On peut déduire que les parois de cryogel CF1 sont poreuses et fibreuses. De ce fait la porosité des cryogels apparaît à différentes échelles de micro à nano-pores. La densification des cryogels avec l'augmentation en teneur de lin a été déjà mentionnée (Fig.5), et les images morphologiques confirment cette densification avec la diminution progressive de porosité (nombre des pores sur la surfaces de cryogels 3%) par rapport à celui de 1% en lin. L'apparition des traces de fibres de lin pour les cryogels synthétisées à différentes concentrations exprime que le type de solvant EMIMAC/DMSO n'est pas un bon solvant pour le lin. Cette dissolution partielle est influée par l'ajout de co-solvant diméthyle-sulfoxyde.

Études spectrales des cryogels ATR-FTIR:-

Les spectres infrarouges obtenus pour les fibres de lin et le cryogel de lin sont présentés sur la figure 7. Le but de cette partie est de savoir la différence entre la matière primaire brute et le cryogel synthétisée à partir des fibres de lin par spectroscopie infrarouge.

Fig.7. Les Spectres infrarouge de lin brute, solution lin/solvant et cryogel élaborées.

La comparaison des deux états de synthèses (fibres de lin brute, gel de Lin-Solvant) avant le séchage par lyophilisation confrontées afin d'évaluer l'effet de solvant sur le comportement structurale des fibres de lin.

L'apparition d'un enchevêtrement dans l'intervalle $1750-500\text{ cm}^{-1}$ pour les gels de lin en comparaison avec le spectre des fibres de lin brute. Cette enchevêtrement présente les pics caractéristiques de liquide ioniques, et due à la présence des traces de lignine, hémicelluloses et des extractibles dans la solution lin-solvant, qui disparu avec le changement successive de bain de régénération (coloration foncé du premier bain exprime la présence de forte quantité de lignine soluble dans les gels, cette coloration devient claire avec le changement successifs des bains de régénération jusqu'à ce que le bain sera incolore : couleur de coagulant). Il est toute fois possible de distinguer le pic de la ligne de base aux alentours de 1730 cm^{-1} [12].

Cette intensification des pics de cryogels dans les deux intervalles $1000-2000\text{ cm}^{-1}$ et $2750-3500\text{ cm}^{-1}$ par rapport à celui de spectre du lin brute peut être interpréter par l'importance de la méthode de séchage sur la structure spectrale finale de cryogel. On peut déduire que le spectre infrarouge de cryogel possède des intensités des pics plus importants par rapport aux fibres de lin brut. Cette intensification peut être retenue par la formation des cristaux de glace le long de l'étape de sublimation qui influe sur la structure interne du matériau et sur l'ordre latérale des matériaux (formation d'un réseau ordonné de nid d'abeille (Fig.6).

Conclusion:-

Les premiers échantillons élaborés dans le cadre de ce travail ont été considérés comme des matériaux de haute porosité à base de fibre de lin brute. Néanmoins la dissolution est partielle, le pourcentage de dissolution est de l'ordre de 85% de grandeur de celle des fibres de lin dissoute classiquement dans l'EMIMAc pur.

Les observations effectuées à l'aide de la microscopie optique montrent des importantes étapes de changement de la morphologie des fibres lors de l'étape de dissolution (des fibres gonflé par ballonnement, éclatement des ballons, dissolution des membranes externes des ballons...). Le gonflement du lin est observé au premier 6h de dissolution, mais après les 6 heures le gonflement disparaît avec le temps (éclatement des ballons), qui correspondent également à la dissolution progressive des fibres de lin.

La microscopie électronique à balayage a permis de compléter les informations obtenues par microscopie optique, sur la dissolution partielle des fibres de lin, par l'apparition des traces des fibres de lin non dissout à l'intérieur et la surface des cryogels. En effet, ce que l'on a pu observer c'est un trace des fibres de lin non dissolu avec diminution de leurs longueurs et largeur initiale cela est à cause du fort degré de polymérisation de lin ($DP_{lin} = 9000$) et l'effet de l'ajout de DMSO.

Il semble que la structure cristalline soit plus affectée à une plus grande concentration en lin.

Les résultats préliminaires de notre étude sur les moyens d'augmenter l'accessibilité de convertir les fibres de lin en matériaux hautement poreux. Des analyses plus détaillées doivent être effectuées. Par exemple, il serait intéressant de dissoudre la fibre de lin brute avec d'autres types de solvant plus efficaces pour minimiser le temps de traitement et le pourcentage de dissolution.

Remerciements:-

Je tiens à remercier ma directrice de recherche, **Tatiana Budtova** pour son encadrement et ses encouragements depuis mon stage de recherche. Merci Tania du fond du cœur pour tes bons conseils, ton professionnalisme mais aussi pour ton cote très chaleureux et ton rire expressif qui égaye encore les couloirs du labo !

Mao Naga, history, origin, migration, pioneer settler, strategic location.

Abstract

The Mao Naga is a major Naga tribe in Manipur, India. They bear an important place in the history of migration and dispersion of the Nagas. Makhel being the first settlement area of the Nagas and the *Chitebu-Kajü*, the place of dispersal of the Nagas are located in the Mao territory, the Mao Naga can be considered as the pioneer settler among the Nagas. Till today, the Maos continue to play an important role in the politics of the Naga for their strategic location and as a permanent member of the Tenyimi Peoples' Organization (TPO).

Who are the Mao Naga?

The Mao Naga is a major Naga tribe in Manipur, India. They are a recognized 'Scheduled Tribe' under the Constitution Scheduled Tribes order of 1950. They are known as *Ememei* in Mao language. They occupy the northernmost part of the state spread across Senapati district, bounded by similar Nagas like Angami and Chakhesang in the north, Maram and Zeme in the west and south, and Tangkhul and Poumai in the east. The main area of their habitation falls under Mao-Maram Sub-Division. According to 2011 census, the total population of Mao Naga under Mao-Maram Sub-Division is 1, 16,374. There are 58 Mao villages, out of which 38 villages are revenue village and the remaining 20 are federal unit.

The Maos are also found in large numbers in the town areas of Senapati and Dimapur and in capital cities of Imphal and Kohima. They have formed unions to unite and coordinate among themselves in the town areas where they have settled permanently as Mao Senapati Union, Mao Imphal Union, Mao Kohima Union, Mao Hoho Dimapur and Mao Union Jalukie in the respective town. However, for administrative purpose, the Maos are recognised only in Manipur state as a 'Scheduled Tribe'.

The Maos speak 'Mao' or '*Emela*' language which belongs to Angami-Pochuri group of Tibeto-Burman language family (Burling, 2003). Mao language is an officially recognised language which is taught as a subject up to class ten standards in the state. In 2016, the Mao language is recognised to be taught up to class 12 levels by the Council of Higher Secondary Education, Manipur. On August 12, 2016, Mao language is selected as a language subject for 'Language Certificate Programme in North Eastern Language' at Namaste, Centre for Studies on North Eastern States, Nitte University, Derlakatte, Mangalore.

The traditional habitation area of the Mao Naga is also known as 'Mao'. Mao area is a strategically important location connecting the two north eastern states of Manipur and Nagaland. National highway 2 pass through the heart of the Mao inhabited area. This highway is the only effective land connection of the landlocked Manipur state with the rest of the country.

Origin and Migration:-

The origin and migration of the Mao Naga in particular and the Nagas, in general, is shrouded in mystery since they practiced oral tradition. Thus, it is difficult to separate the myth and history as per the oral tradition of the Mao Naga. The origin of the Mao Naga is known through the popular myth '*Dzüliamosüro*'. According to the myth, the godly and the mysterious woman *Dzüliamosüro*, was already there at Makhel (also known as '*Makhräi Rabu*', considered as the ancestral home of the Nagas), while she was resting under the 'Sacred Banyan Tree' (also known as '*Charasü Marabo Kaji*', still standing tall at the heart of Makhel village), a cluster of cloud enveloped her and she conceived and gave birth to *Ora* (spirit/gods), *Okhe* (tiger) and *Omei* (man), (Daniel, 2008; Mao, 2009; Nepuni, 2010; and Salew, 2014). The three brothers lived in harmony however when their mother became old and sick, dispute broke out between the three brothers each claiming to inherit her land. To settle the dispute, the mother devised a contest among the brothers. The contest was a race. For this purpose, she made a simulacrum with grass-like ball at a distance and said that the one who touched the simulacrum first would inherit the mothers' land. Man being the youngest and the most noble was favoured by his mother; told him to make a bow and arrow to shoot at the simulacrum as she knew that he could not compete with the powers of the spirit/gods and tiger in such a race. The man following his mother's instruction succeeded in touching the simulacrum target first by using bow and arrow and finally inherited his mother's land. The three brothers had erected a monolith each at the time of their departure at *Chazhelophi*, about 3 kilometres south of Makhel village. The monolith of spirit/gods and man is still standing erect however the tiger's monolith had fallen down.

Nepuni Salew, the present *Movou* (village Chief) of Makhel village writes that *Omei* (Man), the youngest sons of the mysterious woman *Dzüliamosüro* was known as *Alechameiwo* and he had three sons, namely, *Asüpfu Alapha/Asüpfu Alapha*, *Tuttowo/Chütuwo* and *Khephio* (2014). There are variations in terminology since they practice oral tradition and the myths were passed down from one generation to another through oral narrations and due to variation in dialects from one village to another. Whatever might be the differences, it was said that the three brothers lived together at Makhel for a very long time. It was said that there were seven hundred houses on the eastern side and seven hundred houses on the western side (Onia, 1995). There came a time when they had to move out as population flourished. At the time of their departure, they held feast and had erected a monolith. The monolith is still standing tall and located on the eastern side of the village written as '*Pinoumei Kosü Tamara Tu*', meaning '*dispersal stone of the three brothers*'.

Most Naga writers and scholars accepted that Nagas had migrated from a distant place and first made a settlement at Makhel. Heshu writes that majority of the Naga tribes considered *Kheso* as their original place from where they had migrated following a river name *Chuhrürü* as their main route and settled down at *Makhräi Rabu* (Makhel) where they can view clearly both the topography of east and west of the place (2008). While Lhousa claimed that Naga ancestors hailed from *Heziera* where there was no difference between day and night and a daughter given out in marriage grows unrecognisably changed in a year due to strong wind. He further writes that the Naga forefathers migrated from the eastern part of Asia/Indo-China through Burma and settled at Makhel while some Nagas came straight from Chindwin river direction and settled in northeastern part of Nagaland (2015). Sanyu is of the view that the Nagas were among those tribes who migrated from China and took the route of Patkai section and settled down on the way in the Naga Hills (1996).

While there is lack of clarity about the migratory routes taken to reach Makhel, it is accepted by most of the Naga tribes that the Nagas first settled at Makhel and then dispersed from it (Hodson, 1989 and Banee, 1995). Even recent writers like Lhousa (2015), Lotha (2010), Nepuni (2010); Mao (2009) and Heshu (2008) write that most of the Naga tribes first settled at Makhel and then dispersed from it. Nagas did not migrate at the same time but the migration was a continuous process in ripples of one tribe pushing the other while, in turn, being pushed by another (Lotha, 2010).

Chütebu-Kajü, the 'The Great Naga Wild Pear Tree' is a living proof that before the Nagas dispersed from Makhel; they had planted this tree to remember that they first settled at Makhel and then dispersed from it. This tree is still standing tall at Charanho village about one kilometre to the north of Makhel. It was said that in the past when a branch of this tree fell, those people who dispersed from Makhel observed a *genna* (also known as '*mani/mane*' in Mao language; it is a day of prayer and religious observance day according to the Mao traditional religion and people abstain from going to field) in their own respective village even if the information reached to them a month or so later. This tree marked a symbolic representation of the dispersals of the Naga brothers and more importantly symbolises the oneness of the Nagas (see also Heshu, 2008).

The Naga tribes who trace their dispersal from Makhel are known as 'Tenyimi' or 'Tenyimia'. Angami, Chakhesang, Mao, Maram, Poumai, and Zeliangrong are the tribes who originally traced their dispersal from Makhel. They are united under the Tenyimi Peoples' Organization (TPO), the apex body of the Tenyimi. Its unit is spread over three states namely – Nagaland, Manipur, and Assam. At present, the members' tribes of the TPO are Angami, Chakhesang, Impui, Mao, Maram, Pochury, Poumai, Rengma, Thangal, and Zeliangrong. It is formed to protect the welfare of the Tenyimi brothers and sisters and to foster unity and brotherhood among them as well as the other Naga tribes. They share a deeply rooted cultural heritage and inherent values. Ura Academy, an academic institution is set up to study Tenyidie to preserve and promote the Tenyimi language, literature, cultural values, traditional heritage and customary practices. It is located at Kohima. Tenyidie is the first Naga language to be introduced at the University level. It was introduced in the post-graduate level in 1997 under Nagaland University. In 2005, Tenyidie was further introduced for Ph.D. level. This institution had celebrated 75 years of its establishment in 2014 (1939-2014). On the 11th April 2014, some members of the TPO and Ura Academy came to Makhel and *Chütebu-Kajü* (Charanho village) seeking blessing from their ancestral place with the banner '*We are here to celebrate our common roots*' before the celebration of its Platinum Jubilee.

Ancestors of Mao Naga:-

According to the myths, *Dzüliamosüro*, *Alechameiwo* and *Khephio* were the great ancestress and ancestors of the Mao Naga. However, according to the folktales and folksongs of the people, the forefather of the Maos was known as 'Shüpfumei'. Nepuni writes that Shüpfuwo was the eldest son of Khephio and his descendants were known by the name Shüpfumei in the past (2010). The word Shüpfumei means 'the people of Shüpfuwo'. The Mao people practice oral traditions and the only source of their history is folktales and folksongs. In their folktales and folksongs, the Mao people are referred by the name Shüpfumei. Even in the early writings about the community written by the British administrators has referred them as 'Sopvomah/Sopvoma' or 'Mau/Mao' by Dun (1886), Grierson (1903) and Hodson (1989) and 'Sopvoma' or 'Memi' or 'Mao' by Hutton (1921). 'Sopvomah/Sopvoma' is a corrupt form of Shüpfumei. Heshu writes that 'the difference in the spelling of the earlier writers could be because the writers are unable to capture the exact pronunciation' (2008: 2).

Shüpfuwo had three sons namely, Kapewo, Toliwo and Choro (Saleo cited in Nepuni, 2010). Choro was the youngest and so inherited his father's land and settled down at Makhel while his two brothers went out in search of a better place for settlement in the neighbouring areas. Kapewo first settled down at Saranamei village, (a Poumai village) and his descendants are known as Kapemata/Paomata. Toliwo first settled down at Koide (a Poumai village) and his descendants are known as Tolüpemata/Lepaona (Nepuni, 2010). The descendants of Kapewo and Toliwo are together known as Poumai Naga and the descendants of Choro are known as Mao Naga. In the past, the present Mao and Poumai Naga were together known as Shüpfumei.

Khrasi, Ahrowo, Kade and Memüwo/Memüo were the four sons of Choro. The descendants of Khrasi are known as *Ekhramei* and settled down on the western side; the descendants of Memüwo/Memüo are known as *Imepadeina* and settled down on the northern and eastern side and the descendants of Ahrowo and Kade on the southern side of the Mao territory. They settled down in different villages however in close proximity to one another. At present, the descendants of Choro have settled down in 58 villages under Senapati district of Manipur.

Village Settlement:-

As population increases, within a social structure adaptations must be made in order to prevent the community from fissioning (Caneiro, 1967) so for better life the Mao people looked out for new settlement site. In the past, while selecting a new site for settlement, the Maos were very particular about the location of the site. A new site for settlement was chosen on hilltops since it had a strategic position during the warfare time since they practiced head hunting tradition. Secondly, the Mao people looked out for signs and dreams seeking divine consent before they settle down at a new place. They believe that human being lives along with benevolent and malevolent gods and spirits and so if anybody wanted to settle at a new place, he or she should first claim the place and became the owner of the place before gods/spirit claim it. Even when a child is born, the parents have to first claim the child; otherwise, if gods first claim the child, the child might not survive. Claiming the child means taking the ownership by the parents (Nepuni, 2010). After a site is chosen, they kept simulacrum and go home and see their dreams. If dreams were not good and the simulacrum too falls then they took this signs as the place is not good for settlement and they would leave the place and move on searching for new place.

When a place was finally chosen to settle, on the first day, they carried a shield, a spear, a rooster and materials needed to make fire which is known as *milasü milareï* in Mao language. It may be mentioned here that in olden days the Maos did not use match stick but they practiced indigenous technique known as '*milasü*' to light fire. Even today during cultural festivals, it is frequently witnessed that the traditional art of making fire '*milasü*' is replicated in the form of game or competition. When they reach the particular place which is decided to make settlement; first they claimed the place by saying 'I want to make this as my place and my land' and then they sacrificed a rooster to supreme god and start lightning fire through *milasü* and let the fire and the smoke reached the sky. If the smoke goes straight to the sky, it is taken as a good omen that they will have a prosperous life in the village (Saleo, 2008).

In order to depict the traditional way of making new settlement, the story of how two brothers first settled down at the present Charanho village (also known as Shajouba is one of the biggest Mao villages at present) is explained here. One day two brothers came across the present area of the village and they wanted to settle there, and so the brothers, each kept a bundle of paddy straw on a branch of a tree for the night and went home. The next day they came back to that particular place to see the sign on the paddy straw; it was found that the elder brother's paddy straw was dying out and the younger one's look fresh and lively. From this sign, it was taken that this place can be a good place for settlement however, from the sign of the paddy straw it is taken that the younger brother would be a better leader among the two. Thus, they made their settlement and as per the omen, the younger brother became the *Movou*, village Chief of the village (Personal Interview with Daiho Kholi, the present *Movou* of Charanho village).

In present times, national highway becomes a preferred choice for a new settlement. With the development of national highway 2, the Mao people began to move towards the national highway. National highway 2 passes through the heart of the Mao territory. Some of the Mao villages which are established along the national highway are Kayinu, Song Song, Kalinamei, Phikomei, Tadubi, Khridzüphi, Makhan Tabio, Makhan Centre, Makhan Lovadzüngho, Makhan Khuman, Khongnem Thana, Puni Pfosemei, Mao Karong, Taphou Pudunamei, Mayangkhang Khunou and Daili village.

Social Organization:-

The Mao Naga follows typical patriarchal and patrilineal social set up. They practice monogamy and type of family is nuclear family. Father is the head of a family. His decision is final and binding in all respect. The rule of descent is traced through the father's line or male line. The succession and inheritance of property is through sons or male offspring. The eldest son inherits his father ancestral paddy field known as *opfu lophre* and the youngest son inherit his parent's house. The Mao community gives more importance to the eldest and the youngest sons in a family since it is them who inherit their father's ancestral property. If there is no son in a family, the ancestral/parental house and the father's ancestral paddy field goes to the nearest male relative from the father side and the daughters can inherit only the remaining property of the family. The legacy of a family is carried down by male offspring in a family and so the ancestral properties are passed down only through the male line.

The next level of social organization is 'clan organization'. It is known as '*pfuta*' in Mao language. The clan is an endogamous group in a village. Inter marriage between the clan members is a taboo. Every clan have its own gate known as '*koro*', built nearby the main clan habitation area in the village. Most clan have community land. The members of every clan select their own clan representatives to administer them in the village since time immemorial. The clan representatives are known as *Enulei Kotsümei* or Village Council or Village Authority (at present). The Mao Naga is known to have numerous clans and sub-clans. As they make new settlement site and form a village, they tend to use a different name like their lineage ancestors' name or sub clan as their clan and in this way, they develop new clans with the establishment of a new village. At present, the Maos has more than 60's clans. Some commonly used clan name are Arücho, Arüna, Chachei, Chalai, Chakre, Ekhe, Kadena, Kapena, Kayina, Krichena, Lirina, Piku, Poji, Pfoze, Rajina, Maheo, Saprüna, etc.

Religion:-

The Maos have their own traditional religion known as *Opfufe Chiina* – religion of the forefather. They believe in the existence of a supreme god called *Oramei*. They also believe in the existence of benevolent gods/spirits and malevolent gods/spirits. The benevolent spirits are considered as good and helpful while the malevolent spirits are evil one which causes sickness and suffering to mankind. Thus, their religion can be called as nature-centric and animistic. They performed rituals, observed *gennas* and offered sacrifices to propitiate their gods and made appeasement. Taboos also constitute an important religious element in the Mao traditional religion. It is not only a mere prohibition with a superstitious belief but it guided and governed their socio-religious life. It has two connotations, '*moli chünoe*' – taboos of commission and '*li chünoe*' – taboos of omission (Loli, 2011). *Movou*, the

village Chief been the village priest announced the *gennas*, performed rituals and offered sacrifices for the well being of the people. Sometimes the head of the family or the woman of the family too offer sacrifices and performed rituals for the individual family.

With the coming of Christianity, the traditional religion of the Maos lost its importance and significance. At present, the Maos are 99 percent Christian. Baptist, Roman Catholic, Christian Revival, Seventh Day Adventist and Good Samaritan are the main denomination practiced by the Mao community.

Economy:-

Traditionally, the Mao Naga is an agrarian community. Agriculture is the main stay of the people. The Maos are hard working people. They work from dawn till dusk. They make terrace fields at the slopes or foots of the mountains and along the river bank. The hard work of the people can be judged from the exquisite craftsmanship of converting the hilly terrains into delicately beautiful and continuous terraces covering ranges for the purpose of rice cultivation. Every family of the Mao community has their own terrace fields and cultivate for their sustenance and sustainability (Heshu, 2008).

The Maos also practice shifting/jhum cultivation and permanent garden cultivation. They cultivate different kinds of crops. Rice, maize, potatoes, cabbages, chillies, tomatoes, tree tomatoes, cho-cho (squash), beans, pumpkins, cucumbers, brinjals, oriental onions, spring onions, onions, yam, etc are the main cultivated crop. The Regional Potato Farm, first sponsored scheme of North Eastern Council is in Mao area, located at *Pfukhro* (Song Song). This farm is wholly owned by the state government and targeted to supply potato for the whole north east regions. The Maos are the only community producing potato for commercial purpose in the state. They also supply to the neighbouring state of Nagaland. The Mao people also cultivate fruits like plum, peach, pear, guava, banana, passion fruit, kiwi, grapes, etc for consumption as well as for selling.

The Maos also rear varieties of animals like fowls, cat, dog, pig, cow, buffaloes, duck, rabbit, etc. Cows and buffaloes are used for ploughing the fields. Pisciculture is also practiced since time immemorial. The Mao people used to rear fish in the middle of the wet terrace field known as '*khochübvü*'. Fish is an important food item of the Maos. The penalty for person stealing fish from this *khochübvü* is very severe. In the past, before the introduction of monitory system, the penalty was ten *oji* (a traditional kind of basket to measure and carry paddy).

Floriculture is developing in a big way in Mao area. It was initiated by the womenfolk. They rear flowers for both beautification and for commercial purposes. The Maos has celebrated 'Flower Festival' in the year 2015 and 2016 which is first of its kind in the region. Floriculture is giving a big boost to the economy of the Maos.

In present days, the Maos begin to adopt new occupations. National highway 2 passes through the heart of the Mao inhabited area. The strategic location of the Maos on the national highway 2 has brought a lot of avenues to the Mao community especially in the field of economy. The Maos have taken up entrepreneurship, small time business men and women. And also the agricultural products could be easily transported to state capital Imphal and Kohima and other commercial hubs such as Senapati or Dimapur and sold off at good prices. At three places on the national highway 2, the Maos have developed into tourist place, open up food and tea stall and sells locally produced agricultural products, mostly of organic vegetables and flowers. The three tourist places are Mao Gate (Song Song), Vanee (Tadubi) and Oprüingho (Makhan).

The Maos are pursuing in public sector undertaking like banking, insurance, BPO, call centres, etc apart from government jobs both state and central. Another very prominent occupation adopted by the educated Maos is in the field of teaching. We can see the Maos teaching in private educational institutions in the whole of north eastern states. The economy of the Maos is slowly growing with the passage of times.

Conclusion:-

The Mao Naga bears an important place in the history of migration and dispersion of the Nagas. Makhel being the first settlement area of the Nagas and the *Chütebu-Kajü*, the place of dispersal of the Nagas are located in the Mao territory, the Mao Naga can be considered as the pioneer settler among the Nagas. Till today, the Maos are playing an important role in the politics of the Nagas for their strategic location and as a permanent member of the Tenyimi Peoples' Organization (TPO). The TPO has being playing an active role in Naga's politics fostering peace and unity among them and also other neighbouring tribes in the region. The strategic location of the Mao Naga between

Manipur and Nagaland, the Maos have been playing active role in the Naga's politics for instance - in the year 2010, when the Manipur government banned Mr Thuingaleng Muivah, General Secretary of NSCN-IM from visiting Somdel, his village in Ukhrul district, Manipur after more than four decades of being away and he got stranded at Viswema, the Maos organised peace rally to show their solidarity. Mr Muivah came with the consent of the government of India however Manipur government denied the permission on the grounds that it might cause 'communal disharmony endangering the peaceful co-existence of the different ethnic communities' (Bhatia, 2010: 38) and so the government of Manipur deployed armed forces at Mao Gate, the interstate boundary on the national highway 2 to prevent Muivah's entry to the state. The deployed Manipur armed forces assaulted a civilian at Mao Gate on 5th May 2010. The already tensed situation was aggravated by this incident. The next day i.e. 6th May while the Mao people was going a silent peace rally against this assault and demanding that the Manipur armed forces to vacate the place, the peace rally group were tear-gassed and then fired upon by the Manipur armed forces. This incident had killed two young college going students and injured many, including men, women and children. Every year on 6th May, the Maos observe the death anniversary as 'Martyr's Day' and declared special holiday and all economic activities are restricted on this day in the Mao area. The Mao Council, the apex body of the Mao Naga fought alongside with the United Naga Council (UNC), the apex civil body of the Manipur Nagas during the introduction of Naga People's Front (NPF), a regional political party which originated from Nagaland state in the year 2011.

Abstract

This world is termed science and technology. Using digital devices could be a vast part of their everyday expertise. In each facet of life, we have a tendency to use technology. Technology creates our life quicker, better and easier. With the assistance of technology, we are able to simply create the teaching-learning method softer and on the market. There's no facet of human life that isn't bitten by technology. Numerous technologies have been employed in education, the internet is one in every of them. The Internet is that the backbone of this society. The Internet plays a very important role in developing the communication or interaction method. Present days is that the world of web or internet. The Internet has created our lives batter. Through the internet, we are able to simply communicate with our knowledgeable or guide everywhere in the planet. It's true that the employment of internet in rural and urban areas is increasing day by day. This study was conducted to compare the use of the internet by rural and urban college students. The sample consists of 150 female and 150 male students from four colleges in Purulia district, West Bengal, India selected randomly. The study revealed that urban college students use the internet quite rural college students in terms of daily or $\frac{3}{4}$ times of every week as calculated criteria. Once analysis it's additionally found that male college students use internet quite the feminine college students in terms of daily or $\frac{3}{4}$ times of every week. The present study also indicates that Science college students use internet over the arts college students in terms of daily or $\frac{3}{4}$ times of every week. However, the humanities college students use the internet over science counterpart in terms of $\frac{3}{4}$ times of a month or at least one time of a month. Gift study additionally indicates that Hindu college students use the internet quite Muslim college students in terms of daily or $\frac{3}{4}$ times of every week and a lot of students use internet for the purpose of social media and news.

Introduction:-

Internet is one of the powerful parts of technology and also essential for whole human society. Internet provides 24/7 access information at one click. Today without internet we can't think about our daily life. Internet is the core part of education system. Today more people are on the internet than anywhere else. With over 460 million internet users, India is the second largest online market, ranked only behind China. By 2021, there will be about 635.8 million internet users in India. Despite the large base of internet users in India, only 34.8 percent of the Indian population accessed the internet in 2016. This is a significant increase in comparison to the previous years, considering the internet penetration rate in India stood at about 10 percent in 2011. Furthermore, men dominated internet usage in India with 71 percent to women's 29 percent (www.statista.com/topics/2157/internet-usage-in-india). At present, the study noted, rural Indians use the Internet mainly for social network websites (around 70% of the Internet users living in rural areas) such as Facebook, and for emailing. A report titled 'Internet in India 2016' by the Internet and Mobile Association of India (IAMAI) jointly published by the IMRB, mentions that the number of internet users in India is expected to reach between 450-465 million by June 2017. It adds that the country had 432 million mobile internet users in December 2016, of which 269 million or 62.3% were from urban India and 163 million, or 37.7% were from rural India (Pai, 2017, <http://www.medianama.com/author/vivek/>).

Internet used in India (Figures by Millions)

Source: IMRB 1-cube.

By gender, 40% of daily internet users from urban areas consisted of females, where only 25% of daily internet users from rural areas were females.

Today the use of internet is the common matter in India. It is assumed that the college students in India feel more dependent on the Internet for their class assignments and for the latest information about their subject areas than conventional resources of information. A good number of the youth particularly college students use the internet for social interaction and communication as well as for their education. But, just as they use the internet to take help of their education, they use social sites to enrich their social lives (Jones, 2002). College also feels a bit handicapped in updating their knowledge base quickly without using the Internet for their research and classroom teaching activities (Sridevi & Indrani, 2015). Internet came to India in early 1990 for a restricted group of users only. But, now it is open to everyone (Singh, 2014). Jackson, et al. (2011) remarked that the Internet would increase the educational level due to its reach and availability to everyone, everywhere and anytime. The internet has created the opportunities for people of all ages of students to contribute and access information.

Definition of Internet:-

Cambridge International Dictionary of English defines Internet as "large system of many connected computers around the world which people use to communicate with each other". (Network of networks) The internet knowledge is the knowledge of the basic theoretical aspects of the internet and its practical application. According to Douglas E. Comer (2003) internet is "the collection of networks and routers that use the TCP/IP protocol suite and function as a single, large network. The internet reaches government, commercial and educational organization around the world.

Statement of the Problem:-

The problem for the present study is specifically stated as below:

A Comparative Study on Internet Use by Rural and Urban College Students.

Literature Review:-

Bimber, B. (2000) after measuring the differences in men's and women's use of the Internet in U.S. found the existence of gender gap in their Internet use. **Ono, H. & Zavodny, M. (2003)** also found women to be less frequent and less intense users of the Internet. Concern about gender inequality has now shifted from access to intensity. **Mishra, O.P., Yadava, N. & Bisht, K. (2005)** conducted a research study to learn the Internet utilization patterns of undergraduate students at the G B Pant University of Agriculture and Technology. The findings of the study revealed that a majority of the students (85.7%) used the Internet in which male students use Internet in greater numbers than females. **Kumar, R. & Kaur, A. (2005)** disclosed that majority of the respondents (69.4%) used the internet for educational purpose, (51.9%) for research purpose, (47.4%) for communication purpose and 34.7% for entertainment purpose. **Mishra, et al. (2005)** indicated that a majority of the students (85.7%) use internet in which that male students are more than female students. **Loan, A.F. (2011)** revealed that majority of the students are frequent users of internet using internet from daily to week basis in which use by urban students is more than their rural counterparts. **Thanuskodi, S. (2013)** found that internet was used by boys and girls to some extent. Both boys and girls had equal access to Internet but there was a difference in usage pattern. **Sharma, et.al. (2014)** conducted a survey on 391 and found that male's students were more addicted to the internet use than female.

Delimitations of the Study:-**(A) Geographical Area**

The investigation was delimited to only Purulia district of West Bengal India.

(B) Level of Education

1. The study was restricted to the college students (UG level) in Purulia district.
2. Among the College students, only the science and Social Science students were considered as the subjects of the present study.

Objectives of the Study:-

The study was conducted to find out the following objectives.

1. To point out the frequency of the internet use by college students
2. To compare the use of internet by rural and urban college students.
3. To compare between Male and Female college students in respect of their using internet.
4. To compare between Arts and Science college students in respect of their using internet.
5. To compare between Hindu and Muslim college students in respect of their using internet.
6. To know the purpose of internet use.

Methodology of the Study:-

The survey method of research was used to conduct the study and a structured questionnaire, specially drafted for the purpose is used for collecting the data. Data were analyzed by different quantitative techniques and presented in the appropriate formats.

Population of the Study:-

All the college students (UG level) in Purulia district of West Bengal (India) are the population of this study.

Sample and Sampling:-

Four Colleges of Purulia district, West Bengal were selected randomly. The researchers selected 300 students randomly. Here stratified random sampling technique was adopted. The sample profile is given in Table- 1.

Table 1:- Sample Profile.

Male	Female	Rural	Urban	Science	Arts	Hindu	Muslim
150	150	130	170	100	200	260	40
Total 300		Total 300		Total 300		Total 300	

Data Analysis and Discussion:-

In this chapter, the researchers analyzed and interpreted the data collected. The data are collected through questionnaire method. After checking the questionnaire for completion and editing the entire, the researchers analyzed the data.

Objective-1: To point out the frequency of use internet by college students.

Table 2:- Show the frequency of use internet by college students

Use Internet	College Students
Daily	100/300 (33.33%)
$\frac{3}{4}$ Times of every week	120/300 (40%)
$\frac{3}{4}$ Times of a month	60/ 300 (20%)
One time of a month	20/ 300 (6.67%)

Figure 1:- Percentage of using internet by college students.

Table 2 shows that 33.33 percentage college students using internet from daily to $\frac{3}{4}$ times of every week and 26.67 percentage college students using internet from $\frac{3}{4}$ times of a month to at least one time of a month.

Objective 2:- To Compare the use of internet by rural and urban college students.

Table 3:- Show use of internet by rural and urban college students

Use Internet	Rural	Urban
Daily	55/130 (42.31%)	80/170 (47.06%)
$\frac{3}{4}$ Times of every week	45/130 (35.62%)	65/170 (38.24%)
$\frac{3}{4}$ Times of a month	20/130 (15.38%)	15/170 (8.82%)
One time of a month	10/130 (7.69%)	10/170 (5.88%)

Figure 2:- Percentage of using internet by rural & urban college students.

Table- 3 shows area wise using internet. It's noted that 77.93 percentages rural college students using internet starting from daily to $\frac{3}{4}$ times of every week. Whereas 85.3 percentages urban college students using internet starting from daily to $\frac{3}{4}$ times of every week. On the opposite hand it's noted that 23.07 percentages rural college students using internet starting from $\frac{3}{4}$ times of a month to at least one time of a month compared to 14.7 percentages of urban college students.

Objective-3: To compare between male and female students in respect of their using internet.

Table 4:- Show internet using by male and female college students

Use Internet	Male	Female
Daily	90/150 (60%)	40/150 (26.67%)
$\frac{3}{4}$ Times of every week	30/150 (20%)	70/150 (46.67%)
$\frac{3}{4}$ Times of a month	20/150 (13.33%)	30/150 (20%)
One time of a month	10/150 (6.67%)	10/150 (6.67%)

Figure 3:- Percentage of using internet by male & female college students

Table- 4 shows gender wise using internet. It's noted that 80 percentages male college students using internet ranging from daily to $\frac{3}{4}$ times of every week. Whereas 73.34 percentages female college students using internet ranging from daily to $\frac{3}{4}$ times of every week. On the other side it's noted that 20 percentages male college students using internet ranging from $\frac{3}{4}$ times of a month to at least one time of a month compared to 26.67 percentages of female college students.

Objective 4:- To compare between arts, science students in respect of their using internet.

Table 5:- Show using internet by Arts and Science college students

Use Internet	Arts	Science
Daily	90/200 (45%)	70/100 (70%)
$\frac{3}{4}$ Times of every week	70/200 (35%)	20/100 (20%)
$\frac{3}{4}$ Times of a month	35/200 (17.05)	10/100 (10%)
One time of a month	10/200 (5%)	00/100 (0%)

Figure 4:- Percentage of using internet by arts & science college students.

Table- 5 shows stream (Arts & Science) wise using internet. It's noted that 80 percentages arts college students using internet ranging from daily to $\frac{3}{4}$ times of every week. Whereas 90% percentages science college students using internet ranging from daily to $\frac{3}{4}$ times of a week. On the other side it's noted that 22.05 percentages arts college students using internet ranging from $\frac{3}{4}$ times of a month to at least one time of a month compared to 10 percentages of science college students.

Objective 5:- To Compare between Hindu and Muslim college students in respect of their using internet.

Table 6:- Show using internet by Hindu and Muslim college students

Use Internet	Hindu	Muslim
Daily	140/260 (53.85%)	10/40 (25%)
$\frac{3}{4}$ Times of every week	60/260 (23.08%)	20/40 (50%)
$\frac{3}{4}$ Times of a month	40/260 (15.38%)	5/40 (12.5%)
One time of a month	20/260 (7.69%)	5/40 (12.5%)

Figure 5:- Percentages of using internet by Hindu & Muslim college students.

Table- 6 shows religious (Hindu & Muslim) wise using internet. It's noted that 76.93 percentages Hindu college students using internet ranging from daily to $\frac{3}{4}$ times of every week. Whereas 75 percentages Muslim college students using internet ranging from daily to $\frac{3}{4}$ times of every week. On the other hand it's noted that 23.07 percentages Hindu college students using internet ranging from $\frac{3}{4}$ times of a month to at least one time of a month compared to 25 percentages of Muslim college students.

Objective 6:- To know the purpose of internet use.

Table 7:- purpose of internet using by college students

Purpose of Internet Use	Total
Educational Information	62/300 (20.67%)
Social Media and News	150/300 (50%)
Audios and Videos	38/300 (12.67%)
Gaming	30/300 (10%)
Other	20/300 (6.67%)

From the table-7 it's clear that the college students used internet primarily social media and news (50%) followed by educational information (20.67%), audios and videos (12.67%), gaming (10%) and a small number of students used internet for other purpose like online shopping or searching (6.67%).

Conclusion:-

Present study indicates that hundred percent college students use internet starting from daily to at least one time of a month.

It is conjointly found that urban college students use internet over rural college students in terms of daily or $\frac{3}{4}$ times of every week as calculated criteria. However, on the opposite hand, it's noted that rural college students are exploitation internet over the urban college students in terms of $\frac{3}{4}$ times of a month or just one occasion of a month. After analysis, it's conjointly found that male college students use internet over the feminine college students in terms of daily or $\frac{3}{4}$ times of every week. On the opposite facet, feminine college students use internet over male college students in terms of $\frac{3}{4}$ times of a month or just one occasion of a month.

The present study indicates that Science college students use internet over the arts college students in terms of daily or $\frac{3}{4}$ times of every week. On the other hand humanities college students use internet over science counterpart in terms of $\frac{3}{4}$ times of a month or just one occasion of a month as a calculated criteria.

Present study conjointly indicates that Hindu college students use internet over Muslim college students in terms of daily or $\frac{3}{4}$ times of every week. However on the opposite facet, it's conjointly found that Muslim college students use internet over Hindu college students in terms of $\frac{3}{4}$ times of a month or just one occasion of a month as calculation criteria.

Most of students use internet for social media, news and 20.67% students using internet for educational information.

On the idea of this analysis work government ought to organized better internet facility in rural and concrete areas and intended the college or school students to most exploitation internet for the aim of education. The internet has emerged because the single most powerful medium for providing access to unlimited data. The internet is associate indivisible a part of today's academic system. The internet facility has enabled the lecturers and also the students to reinforce their educational excellence by providing them the foremost up-to-date data and access to the worldwide data.

Abstract

In this paper we introduce Rapid Automatic Keyword extraction an unsupervised, domain independent and language independent method for extracting keywords from individual documents and compare this model with a graph based ranking algorithm (TextRank). In general TextRank consists of two unsupervised methods for both keyword and sentence extraction. Also we conduct a simple study regarding TextRank with the previously published methods.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Keyword extraction (KE) is termed as the process that automatically identifies a set of elements that best matches with the subject of document. To represent most relevant information contained in the document: key phrases, key segments, key terms or just keywords different approaches were used. Keyword extraction connects different areas of text mining, information retrieval and natural language processing. The process of keyword extraction can be classified into two categories; quantitative and qualitative.

Quantitative techniques are based on statistical relations in addition to formal linguistic processing. Methods like frequency, TF*IDF, co-occurrence are used as word statistics. The basic idea behind this approach is that important terms are most often referenced within the text. But sometimes the most frequent terms are not enough to represent a meaningful keyword. Certainly further modifications are needed for this approach.

Qualitative methods are based on semantic relations and analysis. Semantic analysis relies on semantic description of lexical terms. Such kind of extraction provides highly structured conceptual relations to the content of the text. This method is more reliable than quantitative approach because sometimes it is not compulsory to appear the most important keyword as a frequent item.

This paper presents a new extraction model RAKE operates on individual documents as well as multiple types of documents. The method starts with the selection of candidate keywords and a graph of word co-occurrences is constructed. After that a score is calculated for each candidate keyword. Rather than that we include a discussion on an unsupervised keyword extraction.

Extraction Methods:-

Keyword assignment tasks can be divided into two subclasses: (1) Keyword assignment and (2) keyword extraction, both will finally results a set of keywords. In keyword assignment, keywords are chosen from a predefined class of terms, keyword extraction searches a document with keywords that are explicitly contained in the document.

According to Zahang, automatic keyword extraction methods can be classified into four.

1. Simple statistical approaches
2. Linguistics approaches
3. Machine learning approaches
4. Other approaches

Simple Statistics Approaches:-

Which is the simplest method of keyword extraction, which do not require training data. In addition such methods are language and domain independent. The disadvantage is that in information regarding health and medical, the most important keyword may appear only once.

Linguistic Approaches:-

In such types of methods which pay attention to linguistic features such as parts of speech, syntactic structure and semantic qualities tend to add value, Functioning sometimes are filters for bad words.

Machine Learning Approaches:-

This type of keyword extraction can be seen as supervised learning. In machine learning approach the keywords are extracted from training documents. This approach includes Naïve Bayes, Support vector machines.

Other Approaches:-

Other approaches combines the above mentioned methods with some heuristic knowledge such as position length, etc...

TextRank:-

TextRank is a graph based ranking model that can be used in text processing for the fruitfulness of natural language applications. It consist of 2 unsupervised methods for keyword and sentence extraction.

1. Graph based – Kleinberg's HITS Algorithm
2. Ranking Algorithm Google's PageRank

Let $G = (V, E)$ be a directed graph with a set of V and set of edges E , where E is a subset of $V \times V$. $In(V_i)$ be the set of vertices that point to it and $Out(V_i)$ be the set of vertices that V_i points to. The score of a vertex is,

$$S(V_i) = (1 - d) + d * \sum_{j \in In(V_i)} \frac{1}{|Out(V_j)|} S(V_j)$$

d is a damping factor and its value within the range 0 and 1. During the time of Web surfing, TextRank implements the "random surfer model". When a user clicks on a link with a probability 'd' and the probability of jumping to a new page is 1-d. The value of d usually is 0.85. Starting from any arbitrary node, the computation iterates until convergence below a given threshold is achieved.

Graph Representation of text:-

Depending on the context, text units of various sizes / characteristics can be added as vertices. The important steps followed in the ranking algorithm can be as follows.

1. Identify text units, and add them as vertices in the graph.
2. Identify relationships between these text units and by using these relationships draw the edges
3. Iterate until convergence.
4. Score vertices based on their final score.

Text Rank Keyword Extraction is fully unsupervised. First the text is tokenized and decorated with parts of speech tags. We consider only single words as candidates. Now an edge is added those lexical units that co-occur within a window of n words. After the graph constructed, the initial score of all vertices are set to an initial value of 1, and the above ranking algorithm is applied for several iterations until it converges usually 20-30 iterations and a

threshold of 0.0001. Once the final score is obtained for each vertex in the, vertices are sorted in reverse order of their score, and the top T vertices in the ranking are retained for post processing. T can be set to any fixed values usually ranging from 5 to 20 keywords.

Rake:-

The input parameter of RAKE are a stop list, set of phrase delimiters, set of word delimiters. By using phrase and word delimiters the doc. Is partitioned into candidate keywords. To identify co-occurrences of words within this candidate keywords, no arbitrarily sized sliding window is needed.

E.g.: Compatibility of systems of linear constraints over the set of natural numbers.

Manually assigned keywords:

Linear constraints, set of natural numbers

Candidate keywords parsed:

Compatibility – systems - linear constraints – set - natural number

After identifying every candidate keyword a graph of word co-occurrences is build and a score is evaluated for each candidate keyword. For this several metrics were used. (1) Word frequency, $\text{freq}(w)$, (2) word degree ($\text{deg}(w)$) (3) ratio of degree to frequency ($\text{deg}(w) / \text{freq}(w)$)

After candidate keywords are scored, the top T scoring candidates are selected. We assume T as one-third the number of words in the graph as in Mihalcea and Tarau.

RAKE does not require a training set. TextRank applies syntactic fillers to a document text to identify content words and accumulates a graph of word co-occurrences in a window size of 2. A rank for each word in the graph is calculated through a series of iterations until convergence below a threshold is achieved.

TextRank damping factor 0.85.

Threshold 0.0001

Not have access to the syntactic filters

Advantages:-

- Total time needed for TextRank to extract keywords compared to RAKE is over to times the time of RAKE.
- RAKE If the number of content words increases, the performance also increases because it can score keywords in a single pass whereas TextRank requires repeated iterations to achieve convergence on word ranks.

Related Works:-

According to Rada Mihalcea Dept of CS University of North Texas[1] ;their paper presents unsupervised method for automatic sentence extraction using graph based ranking algorithm in the context of text summarization task. They discussed a set of graph based Ranking algorithms.

HITS (Hyperlinked Induced Topical Search) Kileinberg 1999

Iterative algorithm for ranking web pages according to their degree of authority

Positional power function:-

Introduced by (Herings et al 2001) that determines the score of a vertex as a fun that combines both the number of its successors and the score of its successors.

1. Page Rank used for Web link analysis
2. Weighted graphs

Content of web surfing and citation analysis. TextRank model the graphs are build from natural language texts and may include multiple / partial links between the units that are extracted from text. Consequently, we introduce new formulae for graph based ranking that take into account edge weights when computing the scores associated with the vertex.

TextRank sentence extraction algorithm is evaluated in the context of a single document summarization task using 567 news articles provided during the document understanding evaluations 2002.

Martic Dostal and Karel Jezek [2] conducted a study on automatic keyword extraction based on NLP and statistical methods. Key phrase candidates are extracted by a combination of graph methods (TextRank) and statistical methods (TF * IDF). During the text preprocessing phase, the content is partitioned into meaningful tokens and non-significant characters are removed. The remaining tokens are considered as candidate keywords. Then calculate the TF * IDF score only for these candidate keywords.

Feifan Liu, Deana Pennel, Fei Liu and Yang Liu [3] approaches for automatic keyword extraction using meeting transcripts. The paper suggest that the important part of keyword extraction is to assign a score to a word depending on its importance. Also the article compare different methods for weight calculation the TF IDF framework and the graph model.

TF – IDF FRAMEWORK:-

Basic TF IDF weighting:-

The TF (term frequency) for a word w , in a doc is the no of times the word occurs. The IDF value is $IDF I z \log (N / N_i)$ where N_i denotes the no of documents containing word w_i , and N is the total number of documents.

Parts of speech filtering:-

In addition to using a stop word list to remove words from consideration we also leverage POS information to filter unlikely keywords. Only verbs, nouns and adjectives are likely to be keywords.

Integrating word clustering:-

By using SRILM toolkit words with the same semantic meaning can be identified.

Guangyi Li, Houfeng Wang [4] suggest an improved automatic keyword extraction based on textrank using domain knowledge. They focused keyword extraction for Chinese scientific articles, they used a framework for selecting candidate keywords by Document Frequency Accessor Variety (DF AV) and a TextRank algorithm to improve the performance of keyword extraction, they considered keywords for a specific domain.

Automatic keyword extraction from documents using conditional random fields. (Journal of Computational Information Systems 2008) [5] is another work published on a journal. In this paper keyword extraction based on a CRF model. Conditional Random Fields (CRF) is a state of the art sequence labeling method also their implementation results guarantee that the CRF model is more better than support vector machine, multiple linear regression model etc.

Conclusion:-

In this paper we have proposed and compared two keyword extraction methods: TextRank and RAKE. RAKE gathers high performance when compared with existing keyword extraction techniques. RAKE automatically extracts keywords in a single pass. Also RAKE is high simple and efficient. But TextRank can be used for large number of natural language applications. TextRank consists of two unsupervised method for keyword and sentence extraction. Advantages of TextRank is that it doesn't demand linguistic and domain knowledge.

Abstract

There is a debate about the role of seminal plasma for improved implantation rate and pregnancy rate during in vitro fertilization.

Objective:- The aim of this study is to investigate whether the intrauterine application of SP at the time of the ovum pick-up has any influence on the pregnancy rates in IVF or not.

Methods:- This prospective double-blind placebo-controlled randomized study

Was conducted to compare two groups. The first group represents the cases whom seminal plasma insemination was done and the other group no plasma insemination but placebo. Clinical pregnancy rate and implantation rate were the outcomes.

Results:- 400 patients were randomized after fulfilling the inclusion criteria. 200 patients were included in the study group and 200 patients were included in the control group. Our results found no statistically significant difference in the two groups regarding implantation rate or pregnancy rate (57.3% versus 49.7%, p value=0.39) and (39.2% versus 31.9%, p value=0.69).

Conclusion:- Intrauterine insemination of seminal fluid at the time of ovum pickup is unlikely to increase the pregnancy rate....

Introduction:-

Although the gradual increase in the success of reproduction, over the years, many couples also had been left frustrated following repeated failed attempts. Only 20 to 25 % of the transferred embryos lead to a pregnancy. Endometrial function is a limiting factor of the pregnancy[1]. This percentage cannot be further increased by the improvement of the embryo transfer technique and culture conditions or by an optimal selection of embryos, the endometrium is receptive to implantation in the mid-luteal phase during the so-called "implantation window". Its duration is determined by the sex hormones which regulate the expression of several cytokines., endometrial function and receptivity have been accepted to be the major limiting factors of IVF pregnancy rate[2]. Human endometrium is a complex, multicellular tissue that is regulated by steroid hormones (estrogens, progesterone, androgens and glucocorticoids) and has different characteristics in the various phases of the menstrual cycle. These changes include restructuring of the cellular architecture, expression of specific cell-surface molecules as well as a secretion of biologically active factors such as cytokines, chemokines and growth factors. The process of the regeneration of the endometrium is currently viewed as a process of cell proliferation and a consequent differentiation of endometrial multipotent stem cells[3]. The presence and the characterization of multipotent stromal stem cells, epithelial progenitor cells and endothelial progenitor cells in the human endometrium and decidua have been reported by a number of research groups. These cells reside in both basal and functional layers of the endometrium and can be identified and isolated even from menstrual blood. It was recently demonstrated that endometrial stem/progenitor cells can induce proliferation and this report substantiates the hypothesis on the role of the stem cells in endometrial regeneration[4]. The indisputable biological purpose of the endometrium is to secure the successful development of pregnancy. Embryo implantation is only possible for a short period of time when the hostile uterine lining transforms to a hospitable surface to accept the embryo. The newly acquired capacity of the endometrium to welcome the embryo is termed "endometrial receptivity" and it is viewed as a dynamic process of genotypic and phenotypic changes of the endometrial cells. The result is that they are capable of participating in two-way cross-talk with the embryo which may or may not lead to successful opposition, attachment, penetration and implantation and possibly development and growth of a viable conceptus[5,3]. The molecular mechanisms behind this complex and sophisticated process have been studied using animal models and knock-out (KO) mouse studies have positively identified genes for receptivity (leukemia inhibitory factor-LIF, Homeobox protein X3), responses to the embryo (Cyclooxygenase 2-COX 2) and decidualization (Interleukin 11 Receptor-IL-11R). Additional information has derived from in vitro studies with human endometrial cells and explants cultures, human trophoblasts, and placental explant cultures. Members of the cell adhesion molecules family (integrins, etc.) are expressed on the surface of the epithelial cells during the WOI in humans. Extensive studies are being currently carried out on the timed restricted expression of a number of molecules such as mucin (MUC-1), trophinin, L-selectin, Wingless (Wnt) family members, etc. in reference to the possibility of using them as biomarkers for endometrial receptivity[2]. In addition to exploring the value of endometrial secretion analysis, N. Macklon has employed a human co-culture model, consisting of decidualized endometrial stromal cells and single hatched blastocysts to identify the soluble factors involved in implantation and to correlate these to embryo development. The cytokines and chemokines produced and secreted by the endometrial cells have been discussed in an extensive review. It is pointed out that numerous cytokines such as IL-11, LIF, IL-15, IL-1 and members of the superfamily of the transforming growth factor (TGF) are important factors in establishing the optimal interactions between the embryo and the endometrium[6]. COX-2 (cyclooxygenase-2), EGF (epidermal growth factor) and LIF (leukemia inhibiting factor) Schematic diagram of the implantation process. Exposure to seminal plasma (SP), the fluid component of ejaculate produced by seminal vesicles, may play a beneficial role in implantation[2].

SP, which contains paternal alloantigens and high concentrations of cytokines, growth factors and prostaglandins, induce a state of active immune tolerance, essential for the embryo to be implanted. Animals that become pregnant through artificial insemination or embryo transfer without being exposed to SP have substantially lower rates of implantation than those exposed to SP[7]. Excision of the seminal vesicle glands from males diminishes the tolerance-inducing effect of mating, while the vasectomy to remove sperms from the seminal fluid does not substantially impact the response[8]. These findings have led to the conclusion that the use of SP or its ingredients may stimulate endometrium in IVF cycles in order to improve implantation rates. Several studies have investigated the role of SP in implantation with controversial results, some reporting benefits, whereas others showing no effect[5,3,8]. The purpose of this study is to investigate whether intrauterine application of SP at the time of the ovum pick-up has any influence on the pregnancy rates in IVF or not.

Subjects and Methods:-

This a randomized,-controlled, a double-blind clinical study investigating superiority of Seminal Plasma administration at the time of oocyte pick-up.

Setting;

MIRU,miniauniversity,MIVF.

All couples undergoing IVF or ICSI treatment between January 2010 and December 2013 were considered for enrolment in the trial.Of these, 400 women were eligible for enrolment and consented to participate in the study. Participation was limited to one treatment cycle per couple.Patients were included and randomized at the first consultation in our center, before the start of the treatment. Concealed allocation by computerized randomization. Eligible patients were categorized into two groups. Group A who inseminated by seminal plasma and Group B (placebo group).

The exclusion criteria included the presence of hepatitis B, C, leukocytopenia or other signs of infection and men with <300 µl of SP.

The study was approved by the local ethical committee and each patient's approval was given by written consent. Stimulation was performed using the long agonist protocol, pituitary down-regulation was done using GnRH agonist 0.1 IU Leuprolide acetate S.C. (Leucine, Abbviepharmaceutical) starting in the luteal phase of the previous cycle. After down-regulation of the pituitary gland, patients received in addition either 150–300 IU of recombinant FSH (GonalFw, Merck Serono) or highly purified HMG (Fostimon, IBSA pharmaceutical, Switzerland) per day.Once an adequate ovarian response had been confirmed, 10 000 IU of urinary hCG (Choriomon, IBA pharmaceutical, Switzerland) was used to trigger ovulation. Ovum pick up was done 34–36 h after hCGadministration under sedation. Fertilization was achieved by ICSI. Day 5 grade 1 embryos were transferred back into the uterus. Luteal support was done using vaginal progesterone (Prontogest 400 bid, IBSA pharmaceutical, Switzerland).

Preparation and application of SP:-

Semen samples were obtained before follicle aspiration by masturbation from the patient's partner and were collected in sterile flasks. SP was extracted by centrifugation of ejaculates at 600 g for 15 min. The second round of centrifugation was performed at 10 000 g for 15 min to extract all spermatozoa.

SP was analyzed several times to exclude remaining contamination with spermatozoa. None of the samples contained any spermatozoa after centrifugation.

Then 400 µl of supernatant were diluted with 1600 µl of sterile sodium chloride and mixed. From this solution, 1500 µl was stored in 2 ml syringes at –20°C (serum). For the placebo, 1500 µl of sterile sodium chloride was also stored in 2 ml syringes at –20°C.

Blinding of the samples was achieved by using a placebo (sodium chloride), which could not be differentiated from SP due to the same optical appearance.

An insemination catheter was introduced just at the end of the cervix and 1500 µl SP or placebo was injected.

Statistical Analysis:-

Data were analyzed using Statistical Package for the Social Sciences (SPSS), Version 19. Quantitative data were presented as a range, mean and standard deviation, qualitative data presented as a frequency distribution. Chi-square test, independent sample t-test, ANOVA, and correlation test were used. The probability of less than 0.05 was used as a cut-off point for all significant tests.

Results:-

Table I shows the demographic criteria of the two groups.400 participants were similar in their characteristics so there is no statistical difference between the study and the placebo groups.

	Group (A)	Group (B)
Mean Age (Years)	31 (23.2: 40.1)	32 .1 (21.2: 40.9)
Cause of infertility		
• Male Factor	52	63
• Tubal Factor	30	17
• Endometriosis	67	43
• PCO	18	57
• Unexplained	33	20
Type of infertility		
• Primary	113	141
• Secondary	87	69
No. of ICSI failure	2.3 (1-3)	1.7 (0-2)

Table 2 shows outcomes and embryological data of both groups. There is no statistical difference in the pregnancy rate in the two groups. Also, the number of embryos transferred were similar in both groups so there is no statistical difference between the study and the placebo groups.

	Group (A)	Group (B)	P-Value
Median No. of Transferred embryos	2.71 (1:3)	2.89 (1:4)	-
Clinical Pregnancy Rate	39.2%	31.9%	0.69 NS
Implantation rate	57.4%	49.7%	0.39 NS

Discussion:-

This study disputes the hypothesis that intrauterine instillation of SP at the time of oocyte retrieval increases pregnancy rate. We found that there is no difference in the pregnancy rate between the two groups (39.2% in group A versus 31.9% in group B p=0.69) which is statistically insignificant. Also, we found that there is no difference in the implantation rate between the two groups (57.4% in group A versus 49.7% in group B p=0.39) which is statistically insignificant. In agreement with us, Qasim who found that application of SP in the vagina during intrauterine insemination does not improve the pregnancy rate [9]. Also, the same results found by Fishel who declare that there are no differences in the pregnancy rates between the two groups (32 % versus 33 % and 21 % versus 17 %) [10]. Similarly, VonWolff applied thawed SP at the time of OPU during IVF-ICSI cycles and found a non-significant increase in the pregnancy rate (37.3 % versus 25.7 %) [11]. In contrast, Bellingue who deposited semen in the vagina of patients undergoing IVF at the time of the oocyte fertilization and found an implantation rate of 53 %, compared with 23 % in the control group [12]. Also, Coulam and Stern performed a placebo-controlled clinical trial, depositing into the vagina capsules containing SP or placebo. They described an implantation rate of 80 % in the SP group, compared with 67 % in the placebo group [13]. Therefore, the previous studies are diverse and difficult to compare.

These different results of the previous studies could be explained by the followings

Firstly, different sites of insemination whether cervical, vaginal or intrauterine. In the study published in 2009, pure SP was installed into the cervix, which is very close to the physiological situation during sexual intercourse. In this study, SP was injected into the uterine cavity, which is nonphysiological. Gutsche et al. found that seminal plasma induces endometrial inflammatory responses only *in vitro* in human [3], whereas cervical inflammatory responses

following exposure to ejaculate have been demonstrated in vivo [8]. Also, in vitro experiments demonstrated that this effect is due to SP and not due to semen [14]. Second, trauma induced by the catheter while introduced through the cervix into the uterus may increase the pregnancy rate without any pathophysiological effect. This matches several studies that have demonstrated an increased pregnancy rate after the endometrial injury before IVF treatment (Nastri et al., 2012). This effect was not seen after endometrial injury at the time of follicle puncture.

However, as the introduction of a transfer catheter possibly also causes some cervical trauma, it might be speculated that this would have a positive effect in our new study, although in reality such an effect was not observed. Finally, there is the possibility that intracavitary treatment with SP does not have any clinically relevant immunomodulatory effects on the endometrium at all or that the dilution of SP reduced the effect to such an extent that it was not pronounced enough to have a substantial effect on endometrial function. Indeed, the present study suggests that SP installation into the uterine cavity is unlikely to increase the chance of clinical pregnancy, at least not by a rate $\geq 14\%$ as initially hypothesized.

In conclusion besides the quality of the embryo, endometrial receptivity plays an important role in the establishment of pregnancy. Endometrial functional should be considered of great relevance in a physiological context, e.g. spontaneous conception in a natural cycle and implantation in assisted conception. Finally, there is the possibility that insemination of SP does not have any clinically relevant immunomodulatory effects on the endometrium at all, or have a substantial effect on endometrial function. Intrauterine instillation of diluted SP at the time of ovum pick-up is unlikely to increase the pregnancy rate.

In conclusion, the results of this study cast doubt on the validity of the concept that SP increases endometrial receptivity and thus implantation in humans.

Clinically relevant differences cannot reliably be excluded based on this single study. Finally, the answer to the question about the role of seminal plasma insemination at the time of OPU is still unclear, therefore further studies are still needed, with a larger number of patients; this will further justify the exact place of IU insemination of SP in modifying the endometrial function.

Conflict of interest:-

We declare no conflict of interest.

Cervical Enclerclage, Pre-term Birth,
Progesterone, Short cervix.

Abstract

Introduction: Preterm birth (PTB), defined as birth before 37 weeks of gestation, is the leading cause of perinatal morbidity and mortality. A sonographic short cervix has emerged as a powerful predictor of preterm birth. The present study was conducted to compare the outcome of pregnancy with short cervix with natural micronized progesterone and cervical cerclage.

Materials & Methods: A Prospective Comparative study was conducted in the Department of Obstetrics and Gynaecology of a Tertiary Care Hospital and Medical college. A total of 50 cases of short cervix were included in the study. Out of 50 cases, 25 cases each were divided in two groups by simple random sampling: **Group A:** Given natural micronized progesterone; and **Group B:** Underwent cerclage procedure. Detailed history, ANC check-up, USG and appropriate investigations were carried out for each subject. The cases were followed thereafter in antenatal clinic till delivery and pregnancy outcome was noted.

Results: The mean maternal age was 22.44 years in progesterone group and 22.64 years in cerclage group ($p=0.514$). The outcome of pregnancy with natural micronised progesterone reflected 36% births between 28-32 weeks of gestation, 28% after completion of 37 weeks and only 16% before 28 weeks of gestation whereas outcome with cerclage 36% between 28-32 weeks, 44% after completion of 37 weeks and 8% before 28 weeks ($p=0.56$). The difference in secondary outcome measures (PPROM, LSCS rate) and neonatal outcome (mean birth weight, APGAR, duration of NICU admission, respiratory distress, development of IVH, NEC and neonatal sepsis) in cerclage and progesterone group was also statistically non-significant ($p>0.05$).

Conclusion: Natural micronized progesterone is as effective as cervical cerclage in prevention of premature labour in women with short cervix. Use of natural micronized progesterone is more preferable in clinical practice because it is non-invasive technique, easy to administer and the patients do not suffer from surgical and anaesthesia procedure related adverse effects. It is also not associated with any hospital stay and is very economical.

Introduction:-

Preterm birth, defined by the World Health Organization (WHO) as birth prior to 37 completed weeks (259 days) after the first day of the last menstrual period preceding the pregnancy,¹ is a major global public health problem.² Approximately 15 million neonates are born premature worldwide yearly, implying a rate of 1 out of 10 neonates and nearly 1 million children die each year due to complications of preterm birth.³ In developed countries the preterm birth rate is about 8% of all the pregnancies.³ Among the 10 countries with greatest number of preterm births India has the highest number. Preterm births accounted for 75.3% of all perinatal mortality with mortality risk of 82.6 per 1000 births.^{4,5}

A sonographic short cervix has emerged as a powerful predictor of preterm birth. It is unlikely that this condition is due to a single cause, and a multiple causation model of a sonographic short cervix has been proposed (e.g. a short cervix is syndromic in nature). Such model would have biological, diagnostic, prognostic and therapeutic implications. Indeed, patients may have a short cervix after DES exposure in utero, a cervical conization, a LEEP procedure, intrauterine infection/inflammation, a decline in progesterone action, and the challenging condition clinically referred to as idiopathic cervical insufficiency⁶.

Progesterone is considered a key hormone for pregnancy maintenance, and a decline of progesterone action is implicated in the onset of parturition. If such a decline occurs in the midtrimester, cervical shortening may occur, and this would predispose to preterm delivery.⁷⁻¹⁴ Various randomized clinical trials and data meta-analysis showed that vaginal progesterone decreases the rate of preterm delivery and neonatal morbidity/mortality in women with a sonographic short cervix¹⁵⁻¹⁷.

Cervical encerclage has also been widely used as a surgical method to prevent recurrent mid-trimester pregnancy loss in women at risk. Elective cerclage placement may benefit some women with proven cervical insufficiency. Although highly contentious, more recent data suggest that cervical encerclage may reduce the risk of preterm delivery in that subgroup of asymptomatic singleton pregnancies with both shortening on TVS and a history of spontaneous preterm birth¹⁸.

The Present study aimed at comparing the effects of micronized natural progesterone and cervical encerclage in pregnancy with short cervix.

Material & Methods:-

Type of Study & Study Area:-

A Prospective Comparative study was conducted in the Department of Obstetrics and Gynaecology of a Tertiary Care Hospital and Medical college. The study was conducted over a period of two years from August 2014 to August 2016. A written informed consent was obtained for this study from all subjects after obtaining approval of the ethical committee.

Inclusion Criteria:-

1. Gestational age between 18-28 weeks.
2. Singleton pregnancy.
3. Clinically short cervix 1.5-3 cm or sonographically short cervix or any sign suggestive of incompetent cervix.
4. Previous preterm delivery
5. Previous history of os tightening

Exclusion Criteria:-

1. Congenital anomaly
2. Multi fetal pregnancy
3. Extremely short cervix (<1.5cm)
4. Leaking per vaginally
5. Any major medical disorder (severe heart disease, severe pre-eclampsia, uncontrolled diabetes mellitus and patients in renal failure).
6. Placenta previa, intrauterine infection or inflammation

7. Non consented patients

Sample Size:-

A total of 50 cases of short cervix were included in the study. Out of 50 cases, 25 cases each were divided in two groups by simple random sampling:

Group A: Given natural micronized progesterone (200mg bd /300 mg SR per vaginally capsules of micronized progesterone); and

Group B: Underwent cerclage procedure.

Methodology:-

Study patients at the time of recruitment were subjected to:

1. Detailed clinical history
2. Clinical examination
3. Per abdomen examination
4. Per speculum examination
5. Per vaginal examination
6. Routine ANC profile
7. Ultrasonography

The cases were followed thereafter in antenatal clinic till delivery and outcome was noted. The primary outcome measures were preterm birth <32 weeks of gestation and composite perinatal morbidity and mortality (defined as the occurrence of any of the following events: respiratory distress syndrome, grade III/IV intraventricular haemorrhage, necrotizing enterocolitis, neonatal sepsis, bronchopulmonary dysplasia, or perinatal death).

Secondary outcome measures included preterm birth at <37, 34-37, and <28 weeks of gestation, respiratory distress syndrome, necrotizing enterocolitis, grade III/IV intraventricular hemorrhage, neonatal sepsis, bronchopulmonary dysplasia, perinatal mortality, a composite neonatal morbidity outcome (defined as the occurrence of any of the above mentioned neonatal morbidities), birth weight <1500 g and <2500 g, and admission to the neonatal intensive care unit (NICU).

Data Analysis:-

Data was analyzed using SPSS 21.0 (SPSS Inc., Chicago, IL, USA) using appropriate statistical tests.

Results:-

The mean maternal age was 22.44 years in progesterone group and 22.64 years in cerclage group (p=0.514). Maximum number of women, 28% of progesterone group and 44% of cerclage group, were noted between 18-20 weeks gestation while 20% of progesterone and 44% of cerclage were between 20-22 weeks (p=). Maximum number of women (44%) of progesterone group had cervical length of 1.5-2 cm whereas 44% of cerclage group had cervical length of 2.1-2.5cm (Table 1). The outcome of pregnancy with natural micronised progesterone reflected 36% births between 28-32 weeks of gestation, 28% after completion of 37 weeks and only 16% before 28 weeks of gestation whereas outcome with cerclage 36% between 28-32 weeks, 44% after completion of 37 weeks and 8% before 28 weeks (p=0.56; Table 2). The difference in secondary outcome measures (PPROM, LSCS rate) in both the group were also statistically non-significant (p=1.0; Table 3). Our study also compared neonatal outcome (mean birth weight, APGAR, duration of NICU admission, respiratory distress, development of IVH, NEC and neonatal sepsis) in cerclage and progesterone group. No statistically significant difference was observed between the groups regarding neonatal parameters (p>0.05; Table 4).

Discussion:-

The first randomized clinical trial to examine the effects of vaginal progesterone on the prevention of preterm birth in women with a short cervix was reported by da Fonseca et al.¹⁹ The primary outcome of the trial was the frequency of spontaneous preterm delivery at <34 weeks of gestation. Patients allocated to receive vaginal progesterone had a lower rate of preterm delivery (<34 weeks) than those in the placebo group [19.2% (24/125) vs. 34.4% (43/125)]. In another trial, termed as "PREGNANT" trial²⁰, It was estimated that 14 women with a cervical length between 10–20mm would need to be treated with vaginal progesterone to prevent one case of preterm birth before 33 weeks of

gestation. In addition, there was a significant decrease in the rate of preterm delivery <35 and <28 weeks of gestation. Since then, various trials and meta-analysis have shown the efficacy of vaginal progesterone to prevent preterm birth in cases with short cervix²¹⁻²⁹.

Cervical cerclage was introduced in 1955 by V. N. Shirodkar, Professor of Midwifery and Gynecology at the Grand Medical College in Bombay, India.³⁰ The procedure was developed in response to his observation that “some women abort repeatedly between the fourth and seventh months, and no amount of rest and treatment with hormones seemed to help them in retaining the product of conception.” Despite the 50 years that have elapsed since the introduction of cerclage as a procedure, there is conflicting evidence about its efficacy for standard indications (i.e. prophylactic) or for some patients with a sonographic short cervix. Several randomized clinical trials have been conducted to date which have yielded mixed results³¹⁻³⁸. A meta-analysis of randomized clinical trials of patients with a prior history of preterm birth and a short cervical length (<25mm) suggests that cervical cerclage is effective in reducing the rate of preterm birth and perinatal morbidity/mortality.¹⁵⁸ A different meta-analysis has suggested that women with a prior spontaneous preterm birth and singleton gestation may be monitored safely with transvaginal sonographic cervical length measurements³⁹.

In present study, we observed that both vaginal progesterone and cerclage in patients with a short cervix was associated with a significant reduction in the risk of preterm birth. The key finding is that both are equally effective for the prevention of preterm birth and adverse perinatal outcomes.

Very few studies has directly compared cervical cerclage and vaginal progesterone for the prevention of preterm birth in women with a sonographic short cervix. Most previous randomized trials allocated to receive vaginal progesterone versus placebo /no treatment, or cerclage versus no cerclage for the prevention of preterm birth.

Keeler et al.⁴⁰ compared between patients with short cervix on transvaginal ultrasound between 16 and 24 weeks' gestation treated with McDonald cerclage and those treated with weekly intramuscular injections of 17 alphahydroxyprogesterone caproate. Spontaneous Pre-term Birth (PTB) prior to 35 weeks' gestation occurred in 16/42 (38.1%) of the cerclage group and in 16/37 (43.2%) of the 17OHP-C group (relative risk, 1.14 95% CI, 0.67, 97 1.93). A post hoc analysis of patients with a prior PTB showed no difference in spontaneous PTB <35 weeks between groups. Conde-Agudelo and co-investigators performed an indirect comparison of vaginal progesterone versus cerclage, using placebo/no cerclage as the common comparator. Four studies evaluating vaginal progesterone versus placebo (158 patients) and five evaluating cerclage versus no cerclage (504 patients) were included. Both interventions were associated with a statistically significant reduction in the risk of preterm birth <32 weeks of gestation and composite perinatal morbidity and mortality compared with placebo/no cerclage. Adjusted indirect meta-analyses did not show statistically significant differences between vaginal progesterone and cerclage in reducing preterm birth or adverse perinatal outcomes⁴¹.

The strength of this study is that it is first study in this region to compare directly between vaginal progesterone and cervical cerclage. All previous studies compare either vaginal progesterone with placebo or cervical cerclage with placebo or conducted an indirect comparison. Our study compares two methods directly to be more practical and to avoid the hidden bias such as selection bias which affect indirect comparing.

Table 1:- Distribution of subjects based on baseline characteristics

Characteristic (n=50)	Progesterone group (n=25)	Cerclage group (n=25)	p- value
Maternal age (in years)	22.44± 1.91	22.64± 1.99	0.719
Parity	0.48±0.65	0.36± 0.63	0.514
Gestational age at start of treatment (weeks)	23.2±3.26	22.08±3.13	0.222
Cervical length (mm)	21.92±3.48	22.08±2.98	0.862

Table 2:- Distribution of subjects based on Primary Pregnancy Outcome

Pregnancy Outcome	Group		p- value
	Progesterone group (n=25)	Cerclage group (n=25)	
< 28 weeks	4 (16%)	2 (8%)	0.56
28-32 weeks	9 (36%)	9 (36%)	
33-37 weeks	5 (20%)	3 (12%)	
> 37 weeks	7 (28%)	11 (44%)	
Total	25 (100%)	25 (100%)	

Table 3:- Distribution of subjects based on Secondary Pregnancy Outcome

Pregnancy Outcome	Group		p- value
	Progesterone group (n=25)	Cerclage group (n=25)	
PPROM	1 (4%)	2 (8%)	1.0
LSCS	2 (8%)	1 (4%)	1.0

Table 4:- Distribution of subjects based on Neonatal Outcome

Outcome	Group		p- value
	Progesterone group (n=25)	Cerclage group (n=25)	
Birth weight (g)	2.1±0.18	2.1± 0.19	0.19
APGAR Score	9±0.91	9.4± 0.70	0.09
Days in NICU per admission	15.83±1.01	11±0.92	0.14
NICU admission	6 (24%)	3 (12%)	0.46
Intraventricular hemorrhage	1 (4%)	1 (4%)	1.00
Respiratory Distress	3 (12%)	2	0.67
Necrotizing Enterocolitis	1 (4%)	1 (4%)	1.00
Neonatal sepsis	1 (4%)	1 (4%)	1.00
Bronchopulmonary dysplasia	0	0	NA
Perinatal death	0	0	NA

Conclusion:-

The observations made in present study suggests that natural micronized progesterone is as effective as cervical cerclage in prevention of premature labour in a women with singleton pregnancy with short cervix. Use of natural micronized progesterone is more preferable in clinical practice because it is non-invasive technique, easy to administer and the patients do not suffer from surgical and anaesthesia procedure related adverse effects such as pain, headache, vomiting and other complications. It is also not associated with any hospital stay and is very economical. Using vaginal progesterone saves time for patients as well as doctors.

Abstract

The possibility of using *Helianthus annuus* extractant (sun flower) as a solvent extractant for uranium from its sulfate liquor as means for their recovery has been studied. Several experiments were conducted to determine the relevant factors affecting both the extraction and stripping of the uranium from a synthetic solution. Under the optimum conditions, the achieved uranium capacity has attained about 22 mg/g for the ethanolic extractant. The optimum stripping conditions for uranium content from the loaded ethanolic extractant which is rich of some active compound to form complex with uranium included stripping agent type 1M NaCl /1M HCl, aqueous to organic phase ratio (A/O) 1:3, stripping time 15 min and at room temp. From the prepared sulfate leach liquor of Abu Zeneima ore material (South Eastern Sainai, Egypt) uranium has then been recovered using the working ethanolic extractant under the previously studied optimum conditions, with an efficiency of 98% The obtained strip liquor was then subjected to precipitation using NH₄OH solution at pH of 7.5 and analysis of the obtained precipitate ammonium uranium oxide hydrate [UO₃NH₃H₂O] was found assay 76% uranium which has been confirmed using XRD and EDAX analysis.

Introduction:-

Twenty one century, high lights are focused now upon the environmental concerns. One of the important concerns is the useful employment and recycling of the plant and animal remains, on their burning, cotton stalk, rice husk, sun flower stalk and plant cellulosic remains....etc. are essential pollutants to the atmosphere. Thus, the possibility of using the sunflower as extractants for the recovery of lanthanide could be considered as one of improvement of the using of waste management.

Perennial sunflower species are not as popular for gardens due to their tendency to spread rapidly and become invasive. (Subashini and Rakshitha 2012) evaluated the methanolic extract seeds of *Helianthus annuus* L. for the phytochemical present in the plant and results shown that, the carbohydrates, flavanoids, tannins, alkaloids, sapanins, phytosterols, steroids and fixed oils were present in the extract. (Macias et al. 2008).

In nature, uranium can be found in the Earth's crust at an average concentration of about 2.5 mg/kg but anthropogenic activities, such as utilization of depleted uranium in munitions and nuclear accidents, introduce uranium to the environment on a larger scale. Uranium resulting from mining, reprocessing and disposal activities related to the nuclear industry is a problematic environmental pollutant. The monitoring of the movement of uranium from soil to plants especially to edible plant parts is very important due to possible contamination of the food chain. Uranium presents an exposure hazard due to its chemical toxicity as well as the radioactivity resulting from its decay and its decay products. In plants, uranium is stored mainly in roots, which was demonstrated on hydroponically cultivated sunflower (Dushenkov et al., 1997). Dushenkov et al., (1997) reported that sunflower plants were found to have a high affinity for uranium extraction and were selected for treatment of contaminated water.

Blanco et al. (2006), tested the linearity assumption of the validation of soil-to-plant transfer factors of uranium and Ra226 using *Helianthus annuus* L. grown in a hydroponic medium in addition, transfer of the studied species in both the aerial parts of plants and in the overall seedlings. The results show that the linearity assumption can be considered valid in the hydroponic growth of sunflowers for the radionuclides studied. The ability of sunflowers to translocate uranium and Ra226 was also investigated. In this sense, the removal percentages obtained for uranium and Ra226 were 24% and 42%, respectively. Practically all the uranium is accumulated in the roots. However, 86% of the Ra226 activity concentration in roots was translocated to the aerial part. Shahandeh and Hossner (2002), investigated uranium accumulation from uranium contaminated soil among sunflower plant species. They found also that, uranium accumulated mainly in the roots of plant species.

Generally uranium is influenced by its speciation and low pH conditions (Lauria et al., 2004). Uranium is present as a positively charged uranyl ion UO_2^{2+} in low pH samples and is very mobile U accumulation and distribution in plants has been reported by several authors (Straczek et al., 2010; Véra-Tome et al., 2008, 2009, Ebbs et al., 1998). Sunflower heavily accumulates U in its roots where it is stored (Straczek et al., 2010; Véra-Tome et al., 2008). Conversely, wheat shows low U transfer factors in roots and shoots (Shahandeh and Hossner, 2002). This differential response with respect to plant species is explained by their cation exchange capacity (Dufey et al., 2001; Straczek et al., 2010).

The present work aims to study using the sun flower hexane extractant from its waste by mixing synthetic solution of uranium for its recovery. The obtained optimum conditions were applied upon real sulfate leach liquor of gibbsite ore materials as a case study.

Materials and Methods:-

Materials:-

Plant materials:-

The aerial part of *Helianthus annuus* were collected on April (2013) and identified by Botany department, Faculty of Science, Zagazig University.

Extraction of the ethanolic extractant (HAE2):-

The aerial part are dried in the shadow in air draft were comminuted to powder (2 kg) and exhaustively extracted under reflux over a boiling water bath with 5 liters of ethanol(80%) for 3 hours. The extract was filtered; the process was repeated 3 times. The solvent was removed under reduced pressure at about 60 °C. The process yielded finally 150 g of a sticky dark brown material.

Synthetic solutions of REEs have been prepared from their proper salts. REEs solutions were thus prepared by dissolving analytical grade metal salts in distilled water to obtain accurate concentration 200 ppm (mg/L) solution. The pH of this solution was measured and adjusted at 0.1 using sulfuric acid and all the adsorption experiments were run at room temperature.

Experimental procedures:-

Preparation of standard U (VI) and interferences solutions:-

A synthetic uranium solution assaying 200 ppm has been prepared by dissolving the required weight of the uranyl acetate salt in distilled water that slightly acidified with sulfuric acid solution. The solution pH was adjusted at 4 using sulfuric acid solution. On the other hand, for studying the possible metals interference that might be associated

with uranium in its solutions, proper weights of some of their compounds have been dissolved in the prepared synthetic uranium.

Uranium extraction procedure from sulfate solution by HAE2:-

Uranium extraction from either the synthetic solution or that of Abu-Zeneima leach liquor solutions by the ethanolic extractant has been undertaken after its dilution/kerosene to 10 vol % were carried out by shaking the two phases in separating funnels. The aqueous phase was analyzed for its uranium content and that in the organic phase was calculated by the difference. Several series of experiments were carried out to study the effects of the diluent type, HAE2 concentration, pH, the shaking time, the extraction temp., the interfering metal ions and the O/A phase ratio. On the other hand, the practical saturation capacity of the HAE2 for uranium has also been determined by using the multiple contact technique.

Uranium stripping procedure from the loaded HAE2:-

A number of mineral acids, alkalis and NaCl solutions have been used for studying the uranium stripping efficiency from uranium loaded upon the HAE2. For choosing the eluent, both the shaking time and temperature together with O/A phase ratio have been studied. The resultant strip solution is treated in subsequent circuit to produce a metal concentrate while the stripped solvent is returned for cycle to extraction circuit.

Analytical procedures:-

Ethanolic extractant characterization:-

As mentioned above, HAE2 was analyzed for its acid content in the quality control laboratory of Hashem Brothers for Essential & Aromatic Products using the Gas Chromatography Mass Spectrometry (GC-MS) HP 6890 Series A (Agilent). On the other hand, an infra-red analysis has been achieved for the ethanolic extractant using (FTIR) model Thermo Scientific Nicolet IS10, Germany.

Control Analysis for Uranium:-

Control analysis of uranium in the different aqueous stream solutions as well as in the product has been undertaken by the oxidimetric titration after its reduction using a standard solution of ammonium metavanadate (Mathew, 2009).

Results and Discussion:-

Characteristics of the ethanolic extractant:-

I.R spectrum of the ethanolic extractant:-

From the achieved IR spectral analysis of the the ethanolic extractant shown in Table (1) and plotted in Fig.(1) before complexation with REEs it is clearly evident that a number of characteristics peaks have been obtained.

Fig. 1:- IR characteristic spectrum of the ethanolic extractant.

Table 1:- IR spectral analysis of the ethanolic extractant

Peak No	Spectra Value (cm ⁻¹)	Functional Group
1	3400	OH alcohol
2	2890	C-H
3	2350	X=C=Y (C,O,N,S)
4	2100	C=C
5	1750	C=O
6	1390	C-C
7	1250	C-N
8	1050	C-O

Chromatographic Analysis:-

The almost separated organic compounds were analyzed on Gas Chromatography Mass Spectrometry (GC-MSD). Retention time indices for all compounds were determined while, identification of the components was based on comparison of their mass spectra with those of internal (computer) library W9N11.L (Minimum Quality: 50) and NIST11.L (Minimum Quality: 50) libraries and some reference compounds. As shown in Fig.(2) the major components are 55% benzyl acetate, 16% Linalool and 9% Sotalol (Methane sulphonamide benzene methanol)

**Fig. 2:-** Gas chromatography-mass Spectrometry (GC-MS) of the ethanolic extractant.

Fig 3:- Chemical structure of benzyl acetate.

Fig 4:- Chemical structure of Linalool.

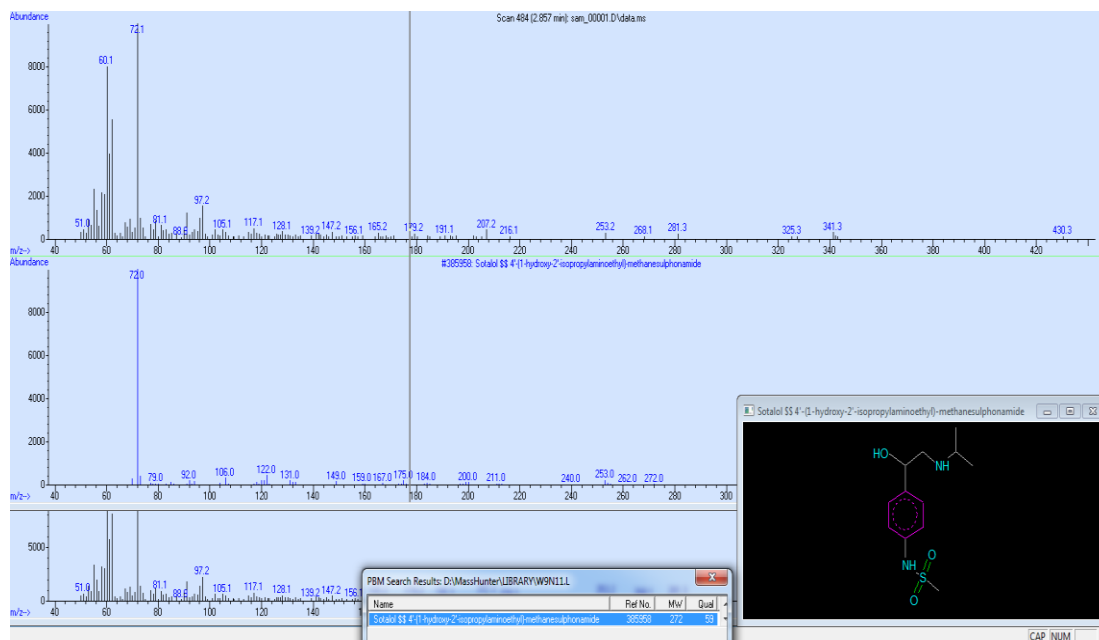

Fig 5:- Chemical structure of Sotalol.

Optimization of the uranium extraction:-

Effect of diluent type:-

To study the effect of the diluent type on uranium extraction from the prepared synthetic solution assaying 200 ppm of uranium three different organic diluents have been used namely; benzene, kerosene and carbon tetra chloride. The extraction process was performed under fixed conditions of a pH 4, a shaking time of 10 min. in an A/O ratio of 1:1 at room temperature and using 10 vol. % HAE. The obtained results indicate that kerosene is the best diluent in which 95% for uranium extraction has been achieved while the toluene and benzene diluents only 50% and 40% for uranium extraction were achieved respectively. Thus carbon tetra chloride was chosen as the best diluent in all extraction experiment.

Effect of pH:-

The effect of pH upon uranium extraction was investigated. For this purpose, a series of experiments were performed at different pH values of synthetic solution ranging from 1 to 5 at fixed condition of O/A 1:1, using 10% vol. HAE2 for 10 min. as contact time. From the resulted in **Fig. (6)**, it is clear that, the maximum uranium extraction efficiency 98% was achieved at pH 4. Rising the solution pH over 4, leads to decreasing uranium extraction efficiency.

Effect of solvent concentration:-

The effect of the HAE2 concentration on uranium extraction efficiency by contacting equal volumes of synthetic solution and solvents with concentration ranging from 2 to 20% at fixed condition. From the obtained data on Fig (7), the results indicated that, by increasing the concentration of the HAE2 from 2 to 8, the uranium extraction efficiency increased from 45 to 90 % while at 10% a 98% of uranium extraction has been achieved.

Effect of the O/A phase ration:-

To study the effect of the A/O ratio upon uranium by using HAE2, the same conditions were applied. The obtained result revealed an extraction efficiency of uranium attaining 90 and 96% respectively at the A/O ratios of 2/1 and 3/1, in a manner to indicate that 1ml of the HAE2 can adsorb about 3.6 and 5.7 mg U respectively.

Effect of contact time:-

To study the effect of contact time upon uranium extraction efficiency by the HAE2 a set of experiments have been performed at different contact times 1,2,3,5 and 10min. at fixed conditions of O/A 1/1, pH 4 and using 10vol of the

HAE2. The obtained results illustrated at **Fig.(8)** have indicated that uranium extraction is rapidly achieved where at 5 min., up to 95% have been obtained and 99% at 10 min. thus the latter considered as the optimum shaking time.

Effect of temperature:-

Using the previously optimum conditions of pH 4, O/A ratio of 1/1, a shaking time of 10 min. and 10 vol. % HAE2 for the studied system and diluted in carbon tetra chloride, a series of experiments was made to study the effect of temperature in the range from 25 to 70 °C. As shown in **Fig. (9)**, it was found that by progressively increasing the temperature an adverse effect upon the uranium extraction efficiency from 98 down to 40% has been obtained. This is most probably due to the decomposition of the components of the organic solvent under high temp.

Effect of interfering metal ions upon uranium extraction:-

In order to investigate the possible and extent the interference of some metals ions- that might be associated with uranium in their ores, solution of Cu, Ni, Fe, Zr, V, Ba, and La, Ce, and Y as REEs have been prepared (1000 ppm) concentration for each. To study the effect of latter, 10 ml of the mentioned 9 metal solutions together with 10 ml of a uranium solution assaying also 1000 ppm have been mixed in a manner that each of which would assay 100 ppm. The concerned experiments was then performed under different pH values varying from 1 to 4 at the previously determined optimum conditions. All the obtained results are summarized in **Table (2)** for the studied metal values at the different pH values.

Table 2:- Effect of pH upon the extraction percent of uranium with some interfering metal ions.

pH	Extraction %									
	U	Y	Ce	La	V	Fe	Zr	Ba	Ni	Cu
1	2.5	2	5	3	17	12	15	14	18	44
2	4	1	2	2	15	9	12	9	14	32
3	5	3	6	2	10	7	8	7	8	21
3.5	18	3	3	3	8	4	5	4	6	11
4	96	2	1	3	1	20	1	2	3	3
4.5	60	1	1	2	1	2	1	2	3	3

Fig(6): Effect of pH upon uranium extraction efficiency % by HAE

Fig(8): Effect of contact time upon uranium extraction efficiency % by HAE.

Fig(7): Effect of HAE Concentration upon uranium extraction efficiency, %.

Fig(9): Effect of temperature upon extraction efficiency % by HAE.

From the above studied of uranium extraction factors, it can be concluded that the optimum extraction conditions for about 98% of uranium content from sulfate solution via HAE2 would be summarized as:

A/O	: 1:1
Contact time	: 10 min.
Ethanollic extractant Concentration	: 10 %
Temperature	: room temp.
pH	: 4

Uranium saturation capacity:-

To determine the saturation capacity of the HAE2 an known volume of the extractant has repeatedly been contacted with the prepared synthetic uranium solution under the previously determined optimum conditions using 1g of the HAE2 (10 vol.% in carbon tetra chloride). After each contact, uranium was analyzed in the obtained raffinate till almost saturation of the extractant. From the results shown in Table (3), it is clearly evident that the saturation capacity of the HAE2 attains about 22mg /1g of extractant for uranium. The obtained data support indeed the possible mechanism of uranium species extraction by the HAE2.

Table 3:- Uranium saturation capacity by the HAE2

Contact number	Uranium distribution	
	Assay in raffinate , ppm	Loaded amount mg/1g HAE2
1	Nil	6
2	Nil	6
3	200	4
4	300	3
5	450	1.5
6	500	1
7	450	0.5
8	600	Nil
Total		22

Mechanism of uranium complexation:-**Physical parameters:-****Thermodynamic characteristics of uranium extraction:-**

Variations of uranium extraction data with temperature for uranium extraction from the aqueous phase by used HAE2 in kerosene was used to calculate the thermodynamic constants including the standard enthalpy (ΔH), and the standard entropy (ΔS) based on Van't Hoff plot using the following formula:

$$\ln K_d = \frac{\Delta S^\circ}{R} - \frac{\Delta H^\circ}{RT}$$

Where K is the equilibrium constant $R = 8.3145 \text{ J mol}^{-1}\text{K}^{-1}$ and T = absolute temperature in Kelvin. ΔH and ΔS were determined from the slope and intercept of $\ln K_d$ versus $1/T$ graph. **Fig. (10)** Plots $\ln K_d$ versus $1/T$, K^{-1} (in case of HAE) which give a straight line whose slope equals $(-\Delta H / R)$ for the extraction of uranium. The ΔH and ΔS values for uranium, in case of HAE2, were -91.26 kJ/mol and -272 J/mol k respectively as calculated from the slope and intercept using the Van't Hoff equation. These values of ΔH and ΔS have then been used to obtain the corresponding free energy ($\Delta G = -10.2 \text{ kJ/mol}$) at 298°K for HAE using the following equation:

$$\Delta G^\circ = \Delta H^\circ - T\Delta S^\circ$$

The negative value of ΔH indicates that the extraction of uranium in this system is an exothermic process and that the reaction becomes more favorable at room temperature. The negative value of ΔG indicates that the reaction is

spontaneous. On the other hand, the observed decrease in the negative values of ΔG with elevated temperature implies that the reaction becomes more favorable at room temperatures.

Kinetic characteristics of uranium extraction by HAE:-

In terms of kinetic modeling, the pseudo-first-order and pseudo-second-order equations were used for the mathematical interpretation of the uranium extraction rate from the aqueous phase by HAE2. The pseudo-first-order equation is represented as follows:

$$\log(q_e - q_t) = \log q_e - \frac{k_1 t}{2.303}$$

Where q_e and q_t are the amounts of metal ions adsorbed at equilibrium and at time t respectively, and k_1 is the equilibrium rate constant of the pseudo first-order equation (1/min). On the other hand, the pseudo-second-order kinetic model is represented as follows:

$$\frac{t}{q_t} = \frac{1}{k_2 q_e^2} + \frac{t}{q_e}$$

Where k_2 is the equilibrium rate constant of pseudo second-order equation. The slope and intercept of the plot t/q_t versus t were thus used to calculate the pseudo second-order rate constants k_2 and q_e . The pseudo-first order kinetic model was found to best fit the experimental results of uranium extraction by HAE in kerosene with correlation coefficients very close to unity other than pseudo second-order kinetic model (Figs. 11 and 12) and the result agree with that reported by (Mckay et al., 1988).

Fig. (10): Plot of $\ln K_d$ against reciprocal temperature for uranium from the 200 ppm by HAE2

Fig. (11): Plot of $\log (q_e - q_t)$ versus time (t) for kinetic extraction of uranium from the 200 ppm aqueous solution by HAE2 at 25°C

Fig. (12): Plot of t/q_t versus time (t) for kinetic extraction of uranium from the 200 ppm aqueous solution by used HAE2 at 25°C

Table 4:- Pseudo First-order constants of uranium extraction by used ethanolic extractant at 25°C.

Pseudo First-order constants	Result of HAE2
K_1	0.065
q_e	104.71
R^2	0.94

Optimization of the uranium stripping factors loaded upon the ethanolic extractant:-

Uranium stripping was carried out at room temperature by shaking equal volumes of the loaded solvent with a suitable stripping solution for a proper time. Factors influencing the stripping efficiency include stripping agent type and its concentration, aqueous to organic phase ratio (A/O), stripping time and temperature.

Effect of the stripping agent type:-

Different stripping agents were applied to strip uranium from the loaded 10% the HAE/kerosene. These included distilled water and 1 M of mineral acids HCl, H₂SO₄ and HNO₃ as well as NaCl/mineral acids (HCl, H₂SO₄ or HNO₃) mixtures. The stripping experiments were carried out in an A/O ratio of 1/1 for 10 min. contact time at room temp. The obtained results presented in **Table (5)** reveal that NaCl acidified H₂SO₄ at the mentioned molarity is actually the most efficient stripping agent for uranium from the loaded with 95% efficiency.

Table 5:- Effect of stripping agent type on uranium stripping efficiency loaded upon HAE2

Stripping agent type/ conc.,	U stripping efficiency, %
Water	20
HNO ₃ (1mole)	65
HCl (1mole)	67
H ₂ SO ₄ (1mole)	86
HNO ₃ /NaCl (mole / mole)	75
NaCl/HCl (mole / mole)	90
NaCl/ H ₂ SO ₄ (mole / mole)	95

It is interesting to mention here, that the uranium will stripped with NaCl/H₂SO₄ solution (mole/mole).

Effect of molarity NaCl/H₂SO₄ upon uranium stripping efficiency from the loaded solvent:-

The effect of NaCl and H₂SO₄ molarity ratio on uranium stripping from the loaded 10% HAE2 was studied while keeping the other stripping factors of contact time for 10 min., the settling time for 5 min. in an A/O phase ratio of 1/1. From the obtained results given in **Table (6)**, it is obvious that NaCl/H₂SO₄ ratio equal 1 has resulted 95% uranium stripping efficiency.

Table 6:- Effect of NaCl and H₂SO₄ molarity on uranium stripping from the loaded HAE2

Molarity of NaCl/H ₂ SO ₄ ratio	U stripping efficiency %
H ₂ SO ₄ / NaCl (mole / mole)	95
H ₂ SO ₄ / NaCl (0.5 mole/1 mole)	85
H ₂ SO ₄ / NaCl (0.25 mole/ 1 mole)	70

Effect of O / A phase ratio:-

In a manner to increase the uranium concentration in the stripping aqueous phase the effect of the A/O phase ratio upon the uranium stripping efficiency from the loaded HAE2 was studied up to the ratio of 3/1 using 1M NaCl /1M H₂SO₄. In these experiments, the other stripping factors were fixed at their studied optimum values. From the obtained results, it was shown that upon increasing the O/A ratio from 1/1 to 2/1, about 98% of uranium stripping was achieved while at the ratio of 3/1 give the same result as the A/O ratio of 2/1 thus the A/O of 3/1 is the optimum phase ratio.

Effect of contact time:-

The effect of a lower contact time upon the uranium stripping efficiency by mixed of 1M NaCl/1M H₂SO₄ from the loaded 10% HAE was studied for 5, 10 15 and 20 min. using the above mentioned optimum molarity of NaCl / H₂SO₄ at an O/A ratio of 3/1 at room temperature and using a settling time of 5 min. The corresponding uranium

stripping efficiencies indicate that a contact time of 15 min. as stripping time is the sufficient to achieve about 98% of the total uranium as shown in **Table(7)**.

Table 7:- Effect of stripping time upon uranium stripping efficiency for the HAE2

Stripping time	Uranium stripping efficiency%
5	66
10	75
15	98
20	98

From the above studied of uranium stripping factors, it can be concluded that the optimum stripping conditions for about 98% of uranium content from the loaded HAE would be summarized as following:

Stripping agent type : 1M NaCl /1M H₂SO₄
 A/O : 1:3
 Contact time : 15 min.
 Temperature : room temp

A Case study:, Abu-Zeneima ore material (South Eastern Sainai, Egypt) as a case study for uranium extraction using HAE2.

According to, the optimum leaching conditions of uranium from its mineralization at Abu-Zeneima ore material (South Eastern Sainai, Egypt) include a H₂SO₄ acid concentration 800 g/L, an agitation time of 4h, a S/L ratio of 1/2 at 100°C and using an ore grain size of – 60 mesh. (El Hazeek , 2008).

Characterization of Abu-Zeneima gibbsite ore:-

As previously mentioned, the working technological sample was provided from Abu Zeneima gibbsite ore lenses found in the shale beds. Results of the complete chemical analysis of the working sample are shown in Table (8).

Table 8:- Chemical analysis of Abu Zeneima ore material

Major oxide	%	Traces	ppm	REEs individual	
				Element	ppm
SiO ₂	21.07	U	560	La	209
TiO ₂	0.97	ΣREEs	3000	Ce	834
Al ₂ O ₃	30.43	Zn	3650	Nd	278
Fe ₂ O ₃	8.24	Cr	760	Sm	214
MgO	3.09	V	134	Eu	111
MnO	4.86	Cu	167	Gd	460
Na ₂ O	2.14	Ni	89	Tb	72
P ₂ O ₅	0.33	Mo	19	Dy	19
CaO	7.25	Cd	45	Ho	0.75
K ₂ O	1.10			Yb	0.98
L.O.I.*	20.17			Tm	0.67
Total	99.55			Y	500

From the prepared sulfate leach liquor of Abu-Zeneima mineralization uranium have then been recovered using HAE under the previously studied optimum conditions. Accordingly, a uranium extraction efficiency of 98% has been obtained. Subsequently, the uranium-loaded the HAE was subjected to uranium stripping using 1M NaCl /1M H₂SO₄ under the studied optimum stripping factors. These included an A/O ratio of 3/1 at room temperature for 15 min. contact time.

Uranium Precipitation:-

The stripping solution containing uranium would then be subjected to pH adjustment by using NH₄OH, which would be added to the solution, with continuous stirring to precipitate uranium at pH 7 as ammonium uranium oxide hydrate [UO₃NH₃H₂O] . After filtration, the produced filtrate would be re-acidified in order to be recycled in a new elution process. **Fig. (13)** Shows XRD analysis of the obtained [UO₃NH₃H₂O] product.

Fig. 13:- XRD analysis of the obtained $[\text{UO}_3\text{NH}_3\text{H}_2\text{O}]$ product.

Conclusion:-

The potentiality of the sunflower as extractant (HAE) for uranium from its sulfate solutions has actually been proven and the studied relevant factors have actually been optimized. These involved a 10 vol. HAE in kerosene, an O/A ratio of 1:1 for a shaking time 10 min. at the pH of 4. Under these conditions, the achieved uranium capacity has attained 33mg/g for uranium. The loaded uranium was afterward completely eluted using $\text{NaCl} / \text{H}_2\text{SO}_4$ solution. Finally, the working HAE was successfully applied for uranium recovery from an actual sulfate leach liquor mineralization in from the actual sulfate leach liquor of Abu Zeneima ore material (South Eastern Sinaï, Egypt).

Abstract

A new study which investigates how users are interacting with brands across various social media. From this study we have found out that on average, people maintain accounts on three channels of social media. One hundred percent of all respondents stated that they actively follow brands on social media.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

All things considered, most of the members are from three online networking groups. Respondents take after brands on various types of web-based social networking to fulfill distinctive requirements. Despite the fact that there are some key reasons they give for taking after brands by means of particular channels there are additionally many reasons which cover and are given paying little respect to the interpersonal organization picked.

Executive Summary:-

On average, people are members of three social media communities. Respondents follow brands on different forms of social media to satisfy different needs. Although there are some key reasons they give for following brands via specific channels there are also many reasons which overlap and are given regardless of the social network chosen.

The most popular reasons for following brands on social media are displayed in Figure 1. The first three reasons are given more or less consistently for all social media networks analyzed. Similarly, the bottom three reasons are given less frequently among all social media platforms.

Figure 1:- Reasons for Following Brands on All Social Media

Despite these overlapping reasons for using social media, there also exist specific reasons people give for using certain platforms.

Facebook remains the most popular social network for following brands, perhaps due in part to its almost ubiquitous status as it is used by 90% of respondents. It is preferred more than twice as often as rival social networks for following brands. People use it to ask companies questions and check companies' credibility. The most popular brand category reported was news the social network is used relatively equally between the two genders.

Instagram was the second most popular social network analyzed for following brands on social media. This platform is used primarily by females and is particularly popular for following fashion brands. Restaurants and bars are also a popular brand category that is followed on Instagram. More so than on other networks, Instagram users express that the social media platform helps them to feel like part of a community.

Twitter was reported to be the least preferred social network for following brands. Although 34% of all respondents were members of this platform, on average users still preferred any other social media platform for following brands. Most notably, the brand categories bands and other(s) were ranked highly by users of twitter. The reasons given by twitter users for following brands fall in line largely with those of the other social media networks.

Hypotheses:-

The investigated hypotheses are reviewed in this section.

Hypothesis 1:-

The group's first hypothesis was as follows:

Respondents are more likely to use instagram to follow fashion and beauty product brands.

To check the validity of this statement, a statistical analysis of respondents' answers about following fashion and beauty brands on social media were reviewed and can be seen in Figure 2. As is displayed, Instagram users most consistently selected fashion brands as one of the brand categories they follow.

Figure 2:- Percentage of followers of fashion brands on all social media

For the second part of this hypothesis, the same review was carried out but with the data regarding the brand category “Beauty and Hygiene Products”. The responses split by social media channel can be seen in Figure 3. While Instagram does not show the highest percentage of users who selected this option, it is important to note that the only two higher ranking social networks had fewer respondents and therefore weight each response more strongly.

Figure 3:- Percentage of followers of beauty and hygiene products on all social media

Nonetheless, this survey only managed to partially support this hypothesis.

Hypothesis 2

The second hypothesis was as follows:

Facebook is used most for following offline brands (bars, restaurants etc.).

To answer this question, the brand categories “restaurants & bars” and “clubs & venues” were combined to analyze how users of the different social networks following “offline” brands. The results can be seen in Figure 4. As can be seen, Facebook scored well below most other social networks despite its advanced event coordination features.

Figure 4:- Percentage of followers of offline brands on all social media

It was therefore concluded that this hypothesis was not supported by the collected data.

Hypothesis 3

The third hypothesis was as follows:

People are most likely to use facebook and twitter to complain, ask questions and check companies credibility.

In order to review this statement, the responses of all groups were compared for the listed reasons people provided for following brands. The results are displayed in Figure 5.

As can be seen, respondents use facebook to complain at a higher rate than reported for many other social networks, however asking questions and checking company credibility is reported on par with the rates reported for other social networks. For this reason, this hypothesis can be considered unsupported.

Figure 5:- Comparison of reasons given for following brands on social media

Hypothesis 4:-

The fourth hypothesis was as follows:

Females are more likely to use Instagram.

In order to test this hypothesis, the number of respondents who reported actively using Instagram was evaluated and split based on gender. The resulting percentages were as follows: 64% female users and only 36% male users. The entire sample of respondents, regardless of social media use, was 54% female and 26% male. Correcting for this slightly female skewed sample, it can nonetheless be concluded that Instagram is more popular among females than males.

Hypothesis 5:-

People are more likely to use facebook and twitter to stay up-to-date on brands.

Hypothesis 6:-

The sixth hypothesis is stated as follows:

People who follow trends closely are more likely to actively use newer forms of social media.

In order to test this hypothesis, a Pearson's correlation between the independent variable based on the Likert scale number derived from question 7 part 1 and the dependent variable derived from the number of social media networks respondents professed to using. The resulting r value is -0.065, i.e. a

Slightly negative correlation with almost no statistical significance. Further analysis on defined cohorts within the Likert scale further confirmed this as those who consider themselves to more closely follow trends had, on average, one less social media platform used as compared to the entire sample. It is therefore concluded that this hypothesis is not supported by the data collected.

Hypothesis 7:-

The seventh hypothesis is:

Respondents will prefer following social media brands on facebook.

In order to test this hypothesis, the answers to a set of analytical hierarchy process pairwise questions asking which social network was preferred among all social networks the respondents indicated they use were analyzed. The results can be viewed below (the median was used due to the high standard deviation):

Respondents' Median Preference of**Social Networks for Following Brands**

100%					
90%					
80%					
70%					
60%					
50%					
40%					No
30%	64%				Yes
20%					
10%		24%		12%	20%
0%	5%	7%	6%		

Figure 6:- Respondents' Median Preference of Social networks for Following Brands.

As can be seen, facebook is by far the most preferred social media network for following brands. This hypothesis is therefore confirmed.

Critical Self Reflection:-

Despite initial efforts to carefully plan and execute this marketing research project, some areas in which improvement can be achieved have been identified along the way. In general, the nature of these problems can be categorized as technical and conceptual.

Technical Difficulties:-

Unfamiliarity with some of the survey software used led to difficulties that affected the quality of responses received. Some questions (particularly multi-choice selections and decision tree scales) were improperly configured and as a result were not mandatory. The result is a portion of respondents simply skipped some questions. While the remaining results were nonetheless usable, this reduced the number of responses which could be analyzed for some questions and, specifically for the social media user groups investigated, which resulted in data for some groups which did not reach theoretical saturation.

Conceptual Difficulties:-

In terms of the questions asked of respondents, some of the underlying methodology could have been improved. Most importantly, the questions posed to users of specific social media platforms were not specific to that platform (i.e. each respondent answers the question “What categories of brands do you follow on social media” with only one answer for all social media platforms used or via the analytic hierarchy process). While creating this set of questions for each social network was considered, the group decided against doing so as it would:

1. exponentially increase the length of the survey, thus increasing the number of drop-outs,
2. increasing difficulty in understanding the question among respondents, resulting in a higher dropout rate, particularly because of a high reliance on respondents whose mother tongue is not English and
3. Assume the ability of respondents to easily differentiate their motivations for following brands differentiated by the social networks used.

Field Report:-

An English-language survey was conducted from 28.12.2017 to 03.01.2017. The methodology included dichotomous questions and question sets, 11-point Likert scales and an analytic hierarchy

process¹ to simultaneously gauge respondents' social media preferences while monitoring their response consistency. The full set of questions asked in the survey is available within the appendix.

Key response metrics are available in Table 1 and Table 2.

Conclusion:-

A new study which investigates how users are interacting with brands across various social media. From this study we have found out that on average, people maintain accounts on three channels of social media. One hundred percent of all respondents stated that they actively follow brands on social media.

Unsurprisingly, facebook remains the most popular social media network as ranked by percentage of members who responded to the survey and by user preference for following brands. Second in both aforementioned categories is Instagram. Twitter, while used by 34 percent of respondents, was the least preferred social network for following brands.

The king of fashion is predictably Instagram, where a whopping 65% of respondents – which coincidentally were mostly female – say they follow fashion brands. Twitter was most popular for news, though facebook users see themselves as, on average, more interested in the affairs around the world.

Despite these stark contrasts, a lot of similarities exist between the social media networks. Generally all users, regardless of the networks they use, stated they follow brands primarily to stay up-to-date about them, because they enjoy the things the brands post and to take part in sweepstakes and contests. Also across the board people said they were least likely to follow brands to show off to their friends.

These results can be used as a benchmark for leading brands and social media to improve their future strategies as these results clearly users or customers brand preferences by using different kinds of social media. Moreover, these results could be helpful for businesses to reach their potential customers easily.

Abstract

Aim: The aim of this review is to provide a comprehensive overview of the available literature on the use of episiotomy and its impact on the pelvic floor and to compare the current knowledge on the subject with recently developed bioengineer programs which allows us to further understand the labor process.

Method: We performed a literature research in the PubMed database for studies referring to the use of episiotomy published between 1990 and 2016, without restrictions for language and study type. We then assessed that knowledge to the findings of a new developing bioengineer program which simulates the childbirth, measuring the level of pressure on the pelvic floor and the outcomes.

Results: Biomechanical models of childbirth allow the simulation of several incisions on the pelvic floor muscles in order to quantify the effect and consequences of episiotomy. According to the analyzed studies, a mediolateral episiotomy reduces the stress on the muscles and the force required to successfully delivery. These models estimate also that the incision limited muscle injury. There was a strong agreement in the findings of the bioengineering program and the current knowledge about medicine. According to the results of the bioengineering study, a mediolateral episiotomy has a protective effect, reducing the stress on the muscles, and the force required during delivery. The intervention also has benefits on muscle injury, reducing the damage to a small zone.

Conclusion: Although there is a strong evidence that the cut applied mediolateral would have less impact on the pelvic floor and a protective effect during delivery, more studies should be made assessing the damage on the perineum and the consequences that may occur (blood loss, infections and others).

Introduction:-

The pelvic floor is a muscular structure with an essential role in women's well-being and health. Its integrity is essential in maintaining urological, gynecological, gastroenterological and pulmonary functions. (Neels et al. 2016) There are numerous risk factors that can contribute to Pelvic Floor Dysfunction (PFD) which may lead to consequences such as Urinary Incontinence (UI), Fecal Incontinence (FI), Pelvic Organ Prolapse (POP) and sexual problems, like dyspareunia. These problems often deteriorate a women's quality of life and result in the need of complex surgical procedures, with high ratings of reoperation. Some of the main contributing factors to the occurrence of PFD are obesity, congenital factors, aging, pregnancy, childbirth, menopause and Chronic Obstructive Pulmonary Disease (Fritel 2010; Neels et al. 2016), which increase the pressure applied on the women's pelvic floor leading to muscular dysfunction or tears.

Approximately 54% of women have normal vaginal delivery, 21% instrumental delivery and 25% undergo caesarean section. (De Souza et al. 2015) The first two are responsible for the appliance of a higher degree of pressure on the pelvic floor, leading to a higher prevalence of PFD. It was therefore important to find a way of relieving this pressure.

Episiotomy is a surgical incision performed by the obstetrician during the second stage of labor (that ensues after a fully dilated cervix and ends with childbirth) on the musculature of the pelvic floor. It is the most common procedure in Obstetrics (Carroli and Mignini 2009; Graham et al. 2005), even though its routine practice is not supported by studies (Myers-Helfgott MG 1999) (de Tairac et al. 2006). Its main aim is to create a wider opening of the vagina preventing the hyperdistention and laceration of the perineum, vagina and, most specially, the muscles and aponeuroses of the pelvic floor, amongst which the levator ani muscle, minimizing post-partum complications. The procedure is done without the previous consent of the patient, being now considered a "obstetric violence" (Melo et al. 2014) (an act in which routine medical or pharmacological procedures are conducted without allowing the women to make the decision). There is controversy regarding when to preform episiotomy as a prophylactic measure amongst professionals. Even without this procedure around 23% of women with vaginal delivery need posterior suture of the perineum. (Leal 2014).

Currently the World Health Organization (WHO) recommends the reduction of episiotomy rate to 10%, encouraging physicians to use their judgement when to perform it. (Melo et al. 2014) The problem remains in establishing a protocol of when and which type to use.

The lack of consensus regarding this practice is an ongoing discussion, therefore the importance of biomechanical studies (Oliveira et al. 2016) to assess the impact on the women's pelvic floor and its capability in preventing PFD.

Methods and Materials:

Using the database of PubMed we acquired studies published from 1990 to 2016 about episiotomy and its diverse effects not only during but also after labor, comparing it to the data obtained by the computational model (simulator).

Results:**General knowledge:**

The pelvic floor of women is a complex muscular structure that must be kept intact as to prevent future severe damage, one of the most common being PDF which may in time lead to many other consequences that leave the woman unable to have the same life as before.

Childbirth is an occurrence when the pelvic floor undergoes a large amount of stress, sometimes unable to cope with it, leading to an increase likelihood of developing PDF. The highest point of this pressure is felt on the vaginal birth, leading to a much higher incidence of diseases such as urinary incontinence, organ prolapse, chronic pelvic pain and dyspareunia in vaginal childbirths than in cesarean. (Bertozi et al. 2011) (Victoria L. Handa 2012).

Perineal injury is the most common obstetrical consequence after vaginal childbirth (18,4% in primiparous women and 24,6% in multiparous). (Bertozi et al. 2011) (Mellier and Delille 1990) Therefore physicians started applying episiotomy as a mode of decreasing the pressure on the pelvic floor in order to attempt to decrease the negative effects vaginal delivery might have had on the pelvic floor. (Fonti et al. 2009; Memon and Handa 2013)

Its appliance leads to a significant reduction of first and second degree tears of the vagina (Lavesson et al. 2014) and anterior perineal lacerations (de Tayrac et al. 2006). It is also associated with a better outcome in assisted deliveries, since the appliance of forceps or perineal tear without episiotomy were associated with higher PFD prevalence 5 to 10 years after birth, unlike with the usage of episiotomy. The likelihood of developing PFD does not increase with the number of episiotomies performed, unlike those with assisted delivery by forceps. The risk of prolapse is much higher in women who suffer natural tears, due to the extensive stretching of the vaginal hiatus which leads to the avulsion of the levator ani. (Victoria L. Handa 2012) It is also performed to hasten the birth, preventing severe damage in a distressed baby, and to minimize or avoid complications from abnormal presentations.

Its use as a routine prophylactic measure was proved not to reduce perineal trauma or pelvic floor relaxation (Klein et al. 1992), thus leading to a more restricted approach to its use. Although being a constant source of discussion and contrary opinions, there is still to be established a consensus regarding its use.

Pelvic floor changes during childbirth:-

The women's pelvic floor is a complex structure that maintains the organs of the pelvic region in place allowing a normal functioning of different systems. This region undergoes an increased amount of pressure during pregnancy, and most notably, during stage II of childbirth. Therefore, it may result in tears and lead to a malfunctioning pelvic floor.

This pavement contains the perineum, the endopelvic fascia, the arcus tendinous fasciae pelvis, the coccygeus muscle, the levator ani muscles and a supporting layer consisting of the anterior vaginal wall and the connective tissue that attaches to the pelvic bones through the pubovaginal portion of the levator ani muscle, and the uterosacral and cardinal ligaments comprising the tendinous arch of the pelvic fascia.

The levator ani muscle along with its associated fascia make the pelvic diaphragm, responsible for maintaining closure of the urogenital hiatus. The anus hiatus on the other hand is composed by the pubic bones and levator ani muscles, the perineal body and external anal sphincter. (Ashton-Miller and DeLancey 2007).

It is easy to understand that the malfunctioning of one of these structures may lead to various consequences on the pelvic floors functions leading to PFDs.

During the II stage of labor the contraction of the abdominal wall and the respiratory diaphragm timed with the peak of uterine contraction greatly increase the pressure on the pelvic floor to successfully drive the fetal head through the hiatus. The pubococcygeus muscle, the shortest and most medial levator ani muscle, suffers the largest tissue strain. Tissue stretch ratios are proportional to fetal head size: increased fetal head diameter by 9% increases medial pubococcygeus stretch by the same amount.

It is also important to note that the pudendal nerve is also susceptible to injury during pregnancy and childbirth, suffering stretching and compression. This is a known risk factor for the development of PFDs, since it is responsible for nervous supply of most of the anatomic structures that maintain pelvic support and continence. (Ashton-Miller and DeLancey 2007; Herbert 2009).

Episiotomy - The procedure:

With the mother on the lithotomy position episiotomy should be performed on the second stage of birth at the time of maximum uterine contraction by inserting two fingers in the vaginal opening (protecting the fetus). If the woman has not received epidural beforehand, a local anesthesia should be applied before using the episiotomy scissor, or less commonly the Mayo scissors, to make an incision of 3-5 cm in length, either midline or mediolaterally. (Bettencourt B. 2003).

If the fetus does not descend, pressure should be applied in the incision site between contractions as to reduce the bleeding and the risk of postpartum hemorrhage.

After the delivery, all layers of the wound should be stitched, being the healing period of 4 to 6 weeks (depending on the length of the incision, type of incision, the suture material used and the proper wound care). The area should be assessed for any signs of trauma.

There is a crescent importance given to the procedure since the way the technique and material might have a preponderant impact on the outcome. (Bertozzi et al. 2011)

Types of Episiotomy:

There are two incisions commonly performed during the procedure: either a midline incision (from the vaginal opening towards the anus) or medio-lateral (diagonal cut from the vaginal opening towards the ischial tuberosity). The former is more used in the USA and preferred due mainly to the suture being easier to perform, a quicker healing process, lesser degree of pain, better sexual function, less blood loss and better cosmetic outcomes. The latter is preferred in South America and Europe because, although the cut does not occur in a natural anatomic plane it is associated with less high degree perineal tears (III and IV) (Thacker 2000).

It is important to access which method is better, or weather a different approach should be used in different settings.

Clinical variables of labor:

Situations that either decrease the compliance of the musculature of the pelvic floor, the vaginal opening or increase the pressure on the pavement might be indications for episiotomy. The variables commonly associated with the more frequent use of episiotomy during the vaginal delivery are primiparity, gestational age >41 weeks, augmented or induced labor, epidural analgesia use, oxytocin use, lithotomy position during fetal expulsion and instrumentation. On the other hand, maternal age <35 years or a neonatal weight < 2500g are associated with lower episiotomy rates. (Ballesteros-Meseguer et al. 2016)

Consequences and Complications:

Even though the execution of episiotomy is a relatively simple procedure it still can have some consequences or complications of either the procedure or the posterior wound or scar tissue. Although the health of the child does not suffer alteration from this procedure, there are a lot of unwanted events for the woman that may arise.

Episiotomy is associated with higher postpartum perineal pain levels in the immediate postpartum period, more stress urinary incontinence at 6 weeks and dyspareunia, but studies show recovery after 6 weeks and a complete normal function in 12 months after the procedure. (Macleod et al. 2013) A recent study (Bertozzi et al. 2011) also showed that episiotomy served as a protective factor of the pelvic disorders in terms of quality of life seeing they had better psycho-physical health status in the follow-up. It has also been speculated that it may result in an increase rate of clear cell carcinoma on the scar site (Han, Zheng, and Wang 2016) and bacterial vaginoses (Letouzey et al. 2015).

If a midline episiotomy is performed there is a higher risk of third-degree lacerations, with rare complications such as incontinence for stool and flatus and fistula-formation. If a mediolateral episiotomy is performed it is more frequently linked with impaired wound-healing. (Langer and Minetti 2006; Dimitrov, Tsenov, and Ganeva 2000; Hirsch 1997).

Other very rare consequences that may result from either the procedure or from the wound described in literature are infection, hematoma, cellulite, dehiscence, abscess formation, pudendal nerve lesion, necrotizing fasciitis and death. (Bettencourt B. 2003)

The Future:

Recent attempts have been made to decrease the need of episiotomy in vaginal birth.

Some studies have shown that exercise for the pelvic floor musculature during birth preparation might facilitate the delivery process and might result in reduced numbers of complications of PFD. (Haddow, Watts, and Robertson 2005) (Klein et al. 1997) Others have tried the appliance of a protecting device on the perineum at time of birth providing a structure to stabilize and prevent the extensive distension of the perineum, which might reduce the likelihood of developing a tear. (Lavesson et al. 2014) A device called EpiNo has also been tested to reduce the rate of episiotomy. (Kavvadias and Hoesli 2016) It consists of a device inserted in the vaginal cavity some time before birth, that will gradually distend the tissues, giving time for the musculature to adjust.

Although some research has been made it is still not clear weather their main goal is achieved and weather it leads to a better outcome than with episiotomy.

Biomechanical Overview (Oliveira et al. 2016):

With the advance in modern technology it is possible to simulate very accurately the human body and to experiment the outcome of different situations. There is a crescent tendency of using this model simulators to assess the outcomes regarding a wider range of variables.

Being that selective episiotomy is still a common procedure from either fetal indication (nonreassuring fetal heart, preterm delivery, breech delivery, macrosomia, shoulder dystocia) or if severe perineal trauma is imminent (instrumental delivery, thick inelastic perineum, previous lacerations, short perineal body), it is important to study the delivery techniques and the different outcomes.

A biomechanical numerical model widely used was applied to investigate the quantitative effects of episiotomy on the pelvic floor. For this model, it is used the pelvic floor muscles (levator ani muscles and coccygeus muscle) with a constant thickness of 2mm and assuming the muscles are fully relaxed due to anesthesia. In this study, we were able to see the resulting effect on the musculature of the pelvic floor of the mediolateral incision, varying the angle (30°, 45° and 60°), degree, length (1cm, 2cm and 3 cm, accounting for the absence of the perineum on the model) and time of incision (after the full descent of the fetal head). All these variables were compared to a delivery without episiotomy.

Fig1 – Inferior view of the female pelvic outlet at the moment that mediolateral episiotomy, with different extensions and angles, should be performed, i.e., after the full descent of the fetal head. The elements selected for the different situations are identified in *black color*. The figures on top are related to episiotomies carried out at 30°: **a** 10mm, **b** 20mm and **c** 30mm. The figures in the middle correspond to the episiotomies performed at 45°: **d** 10 mm, **e** 20 mm and **f** 30 mm incision. The last figures are from 60° episiotomies: **g** 10mm, **h** 20mm and **i** 30 mm incision. (Reprinted with permission from Ref 10).

It was observed that the distribution of the maximum principal stresses varies when the episiotomy is performed, changing also with the extension of the incision. In the non-episiotomy model the maximum value of stress was seen on the insertion points of the rectal area of the levator ani in the symphysis pubis. When episiotomy is simulated there is a shift of the peak stress observed on the posterior area of the levator ani.

In Fig2 it is evident that the episiotomy angle affects the amount of force experienced by the muscles, and the difference is even more evident the greater the extent of incision (longer incisions require less force of delivery).

Fig2 – Antero-posterior reaction forces in the pelvic floor muscles during the passage of the fetus, measured in the nodes highlighted in the pelvic floor model, which represents the zone where boundary conditions were applied. noEPI, no episiotomy performed; EPI30, EPI45 and EPI60, episiotomy carried out at 30°, 45° and 60°, respectively. **a** 10 mm incision, **b** 20 mm incision and **c** 30 mm incision (*Reprinted with permission from Ref 10*)

Fig 3 shows us that the extension of the cut affects the amount of muscle damage, no matter which angle of incision is used. The longer the incision, the lower the damage experienced during delivery on the pelvic floor. When comparing the incision angle it is observed that the episiotomy performed at 30° angle is the most protective, since it is the one with less induced muscle damage. In all of the simulated cases, the levator ani is the most affected. If episiotomy is performed the damage is confined to the upper extremity of the incision, without episiotomy the whole muscular portion suffers.

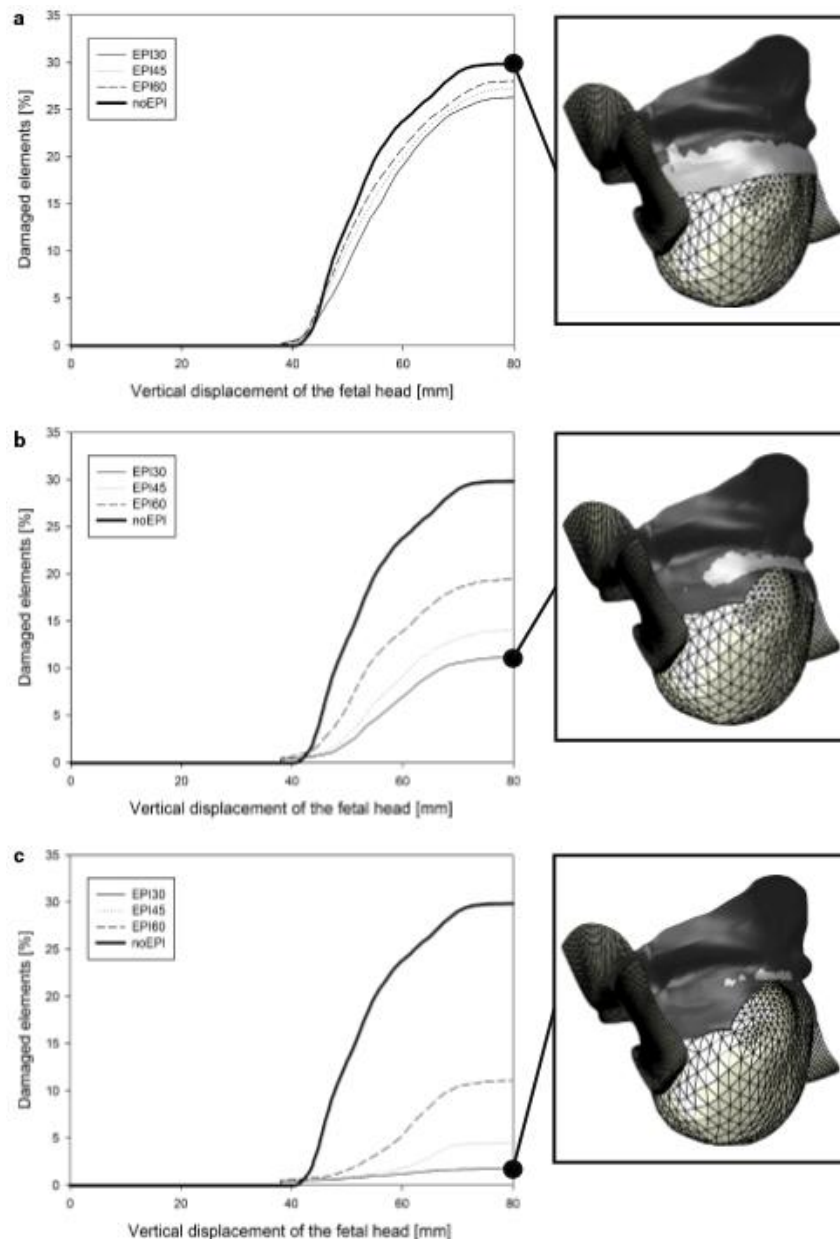

Fig3 – Evolution of the percentage of elements with fiber damage during normal vaginal delivery, and identification of the damaged region in the pelvic floor muscles, represented in light gray, at a vertical displacement of the fetal head of 80mm. noEPI, no episiotomy performed; EPI30, EPI45, EPI60, episiotomies carried out at 30°, 45° and 60°, respectively. **a** 10mm incisions and highlight of the damaged region in the pelvic floor muscles without episiotomy, **b** 20 mm incisions and highlight of the damaged region in the pelvic floor muscles with 30° episiotomy, **c** 30mm incisions and highlight of the damaged region in the pelvic floor muscles with 30° episiotomy. To simplify the images, only fetal head is showing (*Reprinted with permission from Ref 10*)

Episiotomy was associated with a decrease in the opposite forces against the fetal descent, suggesting that mediolateral episiotomy may facilitate birth, protecting the pelvic floor. This study also supports current knowledge that the pubovisceral muscles suffer greater damage and pressure than any other component of the pelvic floor. Some of the limitations for this study are the need to evaluate the long-term implications of intrapartum care (since this procedure is related to a slower recovery), the evaluation of the muscles of the pelvic floor with distinct characteristics (such as thickness and the need to include the perineum), the fact that the fetal head is rigid hindering fetal head modeling.

Discussion:

Episiotomy is still a controversial subject amongst physicians and the main aim of this study is to clarify some aspects of this procedure, contemplating the different biomechanical effects it has on the pelvic floor. The importance of such simulations is undeniable, and its clinical use has become more regular amongst investigators. It was clearly proved the role of episiotomy in reducing the stress forces on the pelvic floor. This leads to less strain for the muscles, which is a known risk factor for the development of PFDs. (Bozkurt, Yumru, and Sahin 2014; Chitra and Panicker 2011) As stated in previous studies, it should be seen as a protective measure when certain characteristics, either maternal or fetal, lead to a disproportional pressure of the fetal head on the pelvic floor. (Ballesteros-Meseguer et al. 2016; Fritel et al. 2008) Still, more studies and clinical trials should be made to establish clear guidelines when to perform this procedure.

Regarding the type of episiotomy (midline or mediolateral), due to the lack of representation of the perineum in this model, it was not possible to simulate the midline cut. Still, three different cut angles were performed (30°, 45° and 60°) and the model suggests that a more midline-like cut would be to greater advantage, since it would result in smaller forces against the musculature of the pelvic floor. This is not supported by current studies, that refer the mediolateral cut as the preferred approach, being that it leads to less complications and less risk of secondary tears or lacerations. (Carroli and Mignini 2009; Myers-Helfgott MG 1999; Necesalova et al. 2016; Thacker 2000) It is also known that the healing process occurs more naturally along the midline (due mainly to anatomical reasons). It would be therefore interesting to use a model with the inclusion of the perineum, and to study the post-cut effects on the pelvic floor and the healing process on both methods.

There aren't many known studies that compare the length of the cut used in episiotomy. In a recent study, *M Stedenfeldt et al (Kalis et al. 2012)* proved that scarred episiotomies with depth > 16 mm, length > 17 mm, incision point > 9 mm lateral of midpoint and angle range 30–60° are significantly associated with less risk of injury. The risk for injury decreased by 70% for each 5.5-mm increase in episiotomy depth, 56% for each 4.5-mm increase in the distance from the midline to the incision point of the episiotomy, and 75% for each 5.5-mm increase in episiotomy length. The biomechanical simulator showed a clear lessening of the force suffered by the pelvic floor structures with the increase of the length. But with longer cuts may arise more complications. A trial comparing the outcomes of the healing process with different episiotomies length would be important.

The effect of the timing of application of this procedure was not studied in this model, but according to recent studies (Rusavy, Karbanova, and Kalis 2016) there might be some advantage in applying the cut only when the head reaches its full descent in terms of additional vaginal trauma and blood loss.

Some limitations and prospective for future studies are the lack of consideration of tissue stresses, the simplified fetal head geometry and the lack of consideration of the difference that exists between the different components of the pelvic floor.

Conclusion:

Although it is clear the use of episiotomy is a contributing factor to the decrease of pressure on the pelvic floor during vaginal childbirth, leading to less PFD, it is still unclear the specific guidelines that should be used to apply this procedure, neither which technique should be used.

L-asparaginase; *Pisum sativum*; Enzyme purification

Abstract

Asparaginase was extracted from Frozen Plant seeds of *Pisum sativum* collected from a field crop after 3 months of freezing. Enzyme specific activity was (74.1 U/mg). Asparaginase was extracted from frozen seeds and purified by ion exchange chromatography using DEAE-Cellulose and gel filtration chromatography using sephadex G-200. We found that the molecular weight of asparaginase is 44000 Dalton, specific activity of Purified asparaginase was 226.5 U/mg. Purified asparaginase was characterized, the optimum pH for enzyme activity and stability was pH 8.5 and 9.5 respectively, while the optimum temperature for enzyme activity and stability was 40 °C and 37 °C respectively.

Introduction:-

L-asparaginase (E.C.3.5.1.1) is the enzyme that catalyzes the hydrolysis of the amide group of L-asparagine releasing L-aspartate and ammonia. The enzyme plays important roles in the metabolism of all living organisms and the pharmacology as well (1). Asparagine predominates in the transport of nitrogen in many legumes studied so far and constitutes an important source of reduced nitrogen for developing seeds (2).

Pea (*Pisum sativum*) is a member of Leguminecea family that is widely grown in the world as a source of protein for human food (3). Green pea can be eaten as a cooked vegetable, or can be marketed fresh, canned, or frozen while ripe dried pea is used whole, split, or made into flour (4). Pea is reported to have potential antioxidant, anti-inflammatory and antimicrobial effect (5; 6).

The plant asparaginase from frozen *Pisum sativum* has been less studied. In plants, L-asparagine is the major nitrogen storage and transport compound (2). According to importance of L-asparaginase in different therapeutical treatment. Hence the necessity to find out a novel sources of this enzyme from plants this study was aimed to extract, purify and characterize the enzyme from frozen plant seeds of *Pisum sativum* in order to determine the activity of asparaginase from frozen sources of plant which could be considered as a unique case study

Materials and Methods:-

Sample collection:-

Plant seeds of *Pisum sativum* were collected during first season of 2016 from field of plant crops and freezed for (3) months at 0 °C. (7) 1

Extraction of asparaginase from frozen plant seeds:-

Extraction of asparaginase from frozen plant seeds was achieved according to Chang and Farnden (8) by homogenization, 10 grams of frozen plant seeds with three volumes of 0.05 M potassium phosphate buffer, pH 8.0 containing 1.5 M sodium chloride, 1mM PMSF, 1mM EDTA, and 10% (w/v) glycerol, then centrifuged at 10000 rpm for 20 minutes. Supernatant was regarded as crude enzyme.

Enzyme assay:-

Asparaginase was assayed according to Nesslerization method based on the conversion of L-asparagine to Ammonia and L-asparatate, as described by Ren *et al.* 2010 (9).

Protein concentration in plant extracts and enzyme concentrates was determined according to Bradford method (10).

Purification of asparaginase:-

Asparaginase from frozen seeds of *Pisum sativum* was purified by ion exchange chromatography using DEAE-Cellulose (2×23 cm) equilibrated with 50 mM potassium phosphate buffer (pH 8.0), then bound proteins were eluted with a flow rate of 3 ml/fraction by gradient concentrations of NaCl (0.1-0.5M) in 0.05 M potassium phosphate buffer solution (pH 8.0). Fractions represent asparaginase activity were collected, concentrated and applied onto gel filtration chromatography column using Sephadex G-200 (1.6×43 cm), and eluted with 0.1 M potassium phosphate buffer (pH8.0) with flow rate of 20 ml/hour. Fractions represent asparaginase activity were pooled, concentrated and kept at 4°C for further analysis.

Characterization of purified asparaginase:-

Characterization of purified asparaginase was achieved by determining the optimum pH and temperature for enzyme activity and stability, and the activation energy according to Segel (11), while the molecular weight of asparaginase was determined by gel filtration chromatography technique using Sephadex G-200 as described by Andrews (12).

Result and Discussion:-

Asparaginase activities were detected in plant seeds of *Pisum sativum* that was frozen for three months to determine the activity of enzyme. Al-Hussaini, (2012), showed that the quality of beans and peas increased after three months freezing, in spite of the content of vitamin C was decreased during freezing periods of 3 months (7).

Results indicated in Table (1) showed that asparaginase activity (571.0 U/ml), specific activity of (74.1 U/mg) and total activity (5710 U) were noticed in frozen plant seeds extract. According to these results frozen plant seeds were used for enzyme production, purification, characterization of asparaginase to determine the activity of the Frozen plant sources. Khalaf, et al., (2012), showed that asparaginase activity that extracted from fresh seeds of *Pisum sativum* var. Jof were (605.0 U) and specific activity (75.6 U/mg), (13).

Table 1:- Asparaginase activity and specific activity in the extracts of frozen plant seeds of *Pisum sativum*.

Plant part	Volume (ml)	Activity (U/ml)	Protein (mg/ml)	Specific Activity (U/mg)	Total activity (U)
Seeds	10	571.0	7.7	74.1	5710

Asparaginase extracted from frozen seeds of *Pisum sativum* was purified by ion-exchange chromatography using DEAE-Cellulose. Results indicated in figure (1) showed that one protein peak appeared in the washing step, while there are three protein peaks were appeared after elution peak as mentioned with gradient concentrations of sodium chloride, asparaginase activity was detected in the third peak in figure (1). The maximum asparaginase activity and specific activity in the asparaginase concentrate were 483.0 U/ml and 155.8 U/mg respectively, with 2.06 % fold of purification in the table (2).

Gel filtration chromatography technique was the next step for purification of asparaginase after the ion-exchange chromatography step. Results mentioned in figure (2) showed that only one protein peak represents asparaginase activity was appeared after elution with 0.1 M potassium phosphate buffer solution.

Figure 1:- Ion exchange chromatography for purification of asparaginase from frozen seeds of *Pisum sativum* using DEAE-Cellulose column (2×23 cm) with a flow rate of 20 ml/hour.

Figure 2:- Gel filtration chromatography for purification of asparaginase from frozen seeds of *Pisum sativum* using Sephadex G-200 (1.6×43 cm) equilibrated with potassium phosphate (pH 8.0), fraction volume was 5ml at flow rate of 20 ml/hour.

Results indicated in table (2) showed that there is an increase in both activity and specific activity of the purified enzyme with a purification fold of 0.013 and an increase in the yield of asparaginase to 3.05 %.

In other study, it was found that purification of asparaginase from fresh seeds of *Pisum sativum* using Sephadex G-200 as a second step (after DEAE-Cellulose Ion Exchange chromatography) gives the highest specific activity of 226.5 U/mg and 0.013 fold of purification with 3.05 % yield, (14).

Table 2:- Purification steps of asparaginase extracted from frozen seeds of *Pisum sativum*.

Step	Volume (ml)	Activity (U/ml)	Protein conc. (mg/ml)	Specific activity (U/mg)	Total activity (U)	Purification fold	Yield (%)
Crude enzyme	100	571.0	7.7	74.1	250098	1	1
Ion exchange	15	483.0	3.0	155.8	15939	2.06	0.06
Gel filtration	5	650.9	2.9	226.5	3284.5	0.013	3.05

Molecular weight of the purified asparaginase was determined by gel filtration using Sephadex G-200 in the presence of six standard proteins. Results indicated in figure (3) showed that asparaginase has a molecular weight of 44000 Dalton. Molecular weight of asparaginase differs according to the type of the produced genera, species, type of storage, and parts of plant. There was no evidence for dissociation into subunits on SDS-PAGE, and this suggests that asparaginase is a monomeric protein of molecular weight 69000 Da (15, 16).

Figure 3:- Selectivity curve for determining the molecular weight of purified asparaginase extracted from *Pisum sativum* seeds by gel filtration chromatography using Sephadex G-200 (1.6×43 cm).

Optimum pH for activity of purified asparaginase from frozen seeds of *Pisum sativum* was determined by incubation with asparagine at different pH values ranging between pH4 and pH10.5. Results indicated in figure (4) showed that asparaginase was a maximum activity of 155.4 U/ml at pH 10.0. Effect of pH on the rate of hydrolysis of asparagine is due to the effect of asparaginase on the velocity of enzyme-substrate complex formation and breakdown in addition to its effect on the ionic state of the active site of enzyme since the change in the hydrogen ion concentration may affect the ionization state of amino acid side chains in the enzyme active site (17, 18).

On the other hand, results indicated in figure (5) showed that asparaginase was more stable at pH values ranged between 8.5 and 9.5, at this range enzyme gain both maximum activity and remaining activity, while the activity and remaining activity was lower when the enzyme was incubated at pH values less or more than optimum.

Figure 4:- Effect of pH on activity of purified asparaginase extracted from frozen seeds of *Pisum sativum*.

Figure 5:- Effect of pH on stability of purified asparaginase extracted from Frozen seeds of *Pisum sativum*

Saleh *et al.*, (2015) found that asparaginase from *Phaseolus vulgaris* seeds had optimum pH at 8.0. It showed that the tetrameric form of asparaginase from *Phaseolus vulgaris* seeds remain stable at pH values ranged between pH 7.5–9.0, it had high stability at alkaline pH when incubated for up to 24 h (19).

Effect of temperature on the purified asparaginase was also studied. Results indicated in figure (6) showed that the optimum temperature for enzyme activity was 524.6 U/ml at 40°C, while the activity was decreased at less or higher than this temperature. Most enzyme reactions were found to be accelerated with the increase in temperature for a limited range.

Figure 6:- Effect of temperature on the activity of purified asparaginase extracted from frozen seeds of *Pisum sativum*.

It was also found that the asparaginase stability was 624 U/ml at 37°C as shown in figure (7), at this temperature enzyme gain maximum activity and remaining activity, while they were decreased when the enzyme was incubated at temperatures less or more than the optimum temperature. The increase in temperature may lead to denaturation of enzyme by destruction the three dimensional structure of protein which leads to inactivation of the enzyme at higher temperatures.

Figure 7:- Effect of temperature on stability of asparaginase purified from seeds of *Pisum sativum*.

Black Money, Bribery, Corruption,
Demonetization, Fake Currency,
Surgical Strike and Terrorism

Abstract

One decision and every walk of life is deeply affected. Now life will never remain the same; the fake life, fake culture and fake currency is gone. It is affect the all shades of life. The black money plays an instrumental role in the lives of almost every section of the society in India. The black money occupies an indispensable position and it is extremely relevant at and every stage of life ranging from given gifts to all occasion or festivals, donation at school, transfer, postings in the services, bribery in recruitment, promotion, wedding of children, purchase of properties, jewelry, railway tickets, sanctioning of loans, tenders, filling of nominations, contesting elections etc. For a long term gain the short-term disruption and inconvenience and inevitable. It will pose a great challenge to our patience, resilience and character as well. This is history in making and we have to change our gears. In fact, changing of gears does not mean enhancing the speed. The gears can be change only brought by coordinated efforts at every level of management and participation.

Introduction:-

Maximum all Indians were watching T.V. on 8th November 2016 when in the evening news spread that Prime Minister Mr. Narendra Modi was about to address the at 8p.m., no one had any idea what it was all about. After all, the first such address to the nation in his more than two years of rule, made everyone sit up and take notice. Either during the day Prime Minister had a meeting with the three services chiefs and Mr. Ajit Doval (Present National Security Advisor to P.M) in tow, so media was quick to speculate that, in view of the unabated heavy firing on the LOC and Kashmir by Pakistan terrorist attack. With media, everyone was expecting some major announcement in regard to national security and take some strong steps against Pakistani terrorism after a successful surgical strike. But Prime Minister was much more focused on the menace of black money and had come out with something that would have a deep and long-lasting impact on the country's economy. Like all, me was shocked too when P.M. announced 500 and 1000 would not remain legal tender from today's mid night after four hours they were and would be reduced to just a worthless piece of paper. He said,. " I said to my husband –**“ये सब आज पाकिस्तान के खिलाफ कुछ करने के लिए मिले थे या घर के अंदर ही सर्जिकल स्ट्राइक करने के लिए, हो गया बम बिस्फोट”**. And after that every thing changed for we all Indians. Common people run towards petrol pumps and daily needs shops. But everyone was welcoming this news. Next day morning something different for every one and all media mechanism print, electronic or social media started their TRP and humors game. "America is counting votes as India is counting notes." The announcement not only astonished the people of India but it also stole the thunder of the most waited USA presidential election. The news got attention in the almost all daily newspaper of International arena.

New York Times- “Chaos as Millions in India Crowd Banks to Exchange Currency”

China Daily- “Indians run out of patience as banks & ATMs run out of cash, post-demonetization”

BBC- “Modi’s money medicine: kill or cure?”

The mass media is really become much powerful and in many ways they are influencing the government.

After one month, this country is in an uproar. While this is not the first time that India has attempted to demonetize in a professed bid to tackle the issue of the black money in the country, unlike the last time under Prime Minister Morarji Desai in 1978, this time Reserve Bank of India’s Governor Urjit Patel is in full support of the decision and has called it a bold move that “addresses the growing menace of fake Indian currency notes.”

It was momentous decision that sent shock waves down the whole system-as it was intended to do. The late evening announcement, and the narrow window offered before the order was to take effect, meant just about everybody was caught off-guard. Many wondered whether his move to bolster economy would pay off. But, in one fell swoop, P.M. Modi had sought to burnish his image as a decisive leader- a man given to big ideas and bold strokes – something that made him hero of the middle class with a massive electoral mandate two and half years ago. Significantly, the initiative comes only a few months before crucial assembly polls in Uttar Pradesh & Punjab, where huge amounts of illicit funds are believed to be in circulation. Sources close to the government let on that the demonetization policy-pitched as a ‘surgical strike against black money, corruption, and fake currency noted that fund terror.

Background:-

In the post –Bretton Woods world, government’s control over the supply of currency notes, has become a tool in the hands of government to control inflationary pressure by increasing or decreasing the supply of currency notes. The issues of currency notes itself was very important human invention, which monetized the world and facilitated the trade. But every good thing brings some evils with it.

For the last few years it was being observed the new currency notes issued by the RBI and infused into the banking system of the country were neither coming back to banks nor circulating in the economy. This indicated that people were hoarding currency notes as black money i.e. unaccounted and untaxed money. Due to the increase of black money in the economy government was suffering losses on following fronts:

1. Use of black money in the elections there by harming the very fundamental process of democracy undermining in the long term. Even student’s elections in universities and colleges are becoming prestigious and crossing limit of money.
2. Use of black money for funding of terror activities. After the announcement of demonetization media didn’t hype any terror activities in Kashmir. Humors spread in social media that all pelletters are busy with exchange currency.
3. Use of black money as bribes, resulting into influence of policy decisions as well leading to generation of further unaccounted money.
4. Losing track of the movement of money from one hand to another, there by facilitating unlawful and criminal activities.
5. Enabling the unscrupulous *Hawala* operators to take the wealth out of the country.
6. While black money fled out of the country or was stored in stashes, government has to resort to borrowing from World Bank and other international institutions and pay interest on it.
7. Fake currency trade has been haunting Indian securities establishment as well as economic intelligence agencies for a long time. The agencies believe that the fake Indian currency printed in Pakistan and bought through couriers via Bangkok, Kathmandu and Dhaka airports to fund terror activities on Indian soil.
8. The Political parties are spending huge unaccounted money in elections. This becomes mother of corruption. It also affects the quality governance and breed crony capitalism.

In the light of above factors, this step was a logical step waiting to be taken. Corruption, black money and terrorism are the factors that hinder the development of the economy and peace of the country. Since BJP government committed to development, these steps were considered necessary. A major economic reform was also needed, to increase the confidence of the global business community that India was open for business.

In this single move, the Government has attempted to tackle all the **three issues affecting the economy i.e. a parallel economy, counterfeit currency in circulation and terror financing**. There is no doubt that Prime Minister has pulled out a major coop and substantially enhanced his reputation as a strong leader. The P.M. hadn’t

been exactly idle on globalized corruption, and was continually exploring his menu of options. The P.M. also setup a Special Investigation Team (SIT) to look into the issue in his first cabinet meeting. His intentions were never in doubt but things take time. There were other elements that were key in his scheme of things. P.M. Modi talked on several occasions about promoting plastic money to pave the way for cashless transactions. The Jan-Dhan Project, The Voluntary Income Disclosure Scheme and GST – these were the part of grand plan. But perhaps ambitious voluntary disclosure scheme failed to unearth as much unaccounted money as the government had hoped for. “This might have prompted the push for demonetization. On September 2nd during TV interview, he said, “Don’t blame me if I take tough decisions after 30th September. For an economy where over 80% of transactions are in cash, this is traumatic shock. This is the first radical reform without a looming crisis. The last big reform of 1991 was in response to a foreign exchange crunch. In contrast, the economy now was growing at 7.1% and inflation was under control at 4.2%. There is no precedent in the world for an action on this scale and in these conditions. As a result there’s confusion about possible outcome of this decision.

A few things, however, are certain. It is difficult to oppose a move that attacks illegal money. Prime Minister Modi has flown with scheme on the wings of morality. Undoubtedly, the purge of black money and corruption will make a more honest nation out of us. This step has been taken as much with a view to curbing financing of terrorism through the proceeds of Fake Indian Currency Notes and use of such funds for subversive activities such as espionage, smuggling of arms, drugs and other contrabands into India, as with a view to eliminating black money, which cast a long shadow of parallel economy. One of the most important reason was to lower the cash circulation in the country, which is directly related to growing corruption in our country, as cash transactions are not likely.

After Demonetization:-

In order to implementation the decision of the government, RBI issued certain operational guidelines keeping in view the need to minimize inconvenience of the common people. Old high-denomination bank notes of aggregate value up to Rs. 4000/- could be exchanged at any bank branch or issue office of RBI provided a requisition slip as per the format specified by RBI was presented with a proof of identity. Similar services were also made available in post office. In starting the exchange process was supposed to close on 30th December 2016, it but closed earlier and people can deposit old currency in their account. Petrol pumps, gas, CNG, govt. hospitals, railways and airline booking counters, state govt. recognized dairies and ration stores and crematoriums were to accept old 500/- & 1000/- currency till 15th December 2016. However guidelines have been changed frequently depending on the changing circumstances.

As India lurches into the 2nd months of its tryst with demonetization, it has quickly evident that this is an unprecedented onslaught on the poor. The fallout of the decision of the NDA government to demonetize currency of higher denominations has been felt across all sections of people. There are concerns that it will lead to an overall economic slowdown given the acute shortage of currency for industrial and agricultural operations.

Immediate Problems:-

1. In rural economy “cash is king” and thus reduction in cash flow has hit the villagers badly. Poor penetration of Internet and low level of digital literacy are among the factors that make people depend on cash for transactions. Its impact would be on multiple spheres: agriculture, production, rural incomes, rural demand and rural credit.
2. Business has fallen from Rs. 8-10 crore earlier to just Rs. 4 crore at present. The ‘demon’ in demonetization is in the beginning. As almost 45 days passed and scenes such as this have become all too common, the country struggling to come to terms with Prime Minister Modi’s black money hunt, the biggest such since independence. Various agencies have estimated black money at roughly 20% of India’s GDP.
3. There has been apparent inconvenience to the common man initially. 8 million people every day in queue in front of banks, ATMs & post offices across the country patiently waiting to collect a fraction of what was legitimately theirs. December came and nothing changed. Considering the scale on which an entire population remained literally on its feet, which also resulted in nearly 100 deaths as a reported by media from across the country. As per Opposition parties, more than 50 people have died which can be considered as after effects of demonetization operation.
4. Economist said sectors with large exposures to cash like real estate, transport, and food could witness “downward price pressures”.
5. About 80% of the Indian working population is engaged with micro, small, enterprises and informal sectors. This sector could be adversely affected. The unintended disruption can be huge in the cash-driven economy- particularly the informal rural sector where millions of consumers and small traders rely on cash for the daily

transactions. Moreover, nearly half the population still does not have a bank account. Less than 300 million use the Internet, and therefore the overwhelming majority cannot make electronic payments.

6. It is also believed that demonetization is not a permanent solution but it is just like one shot and it will come back into the system again with full force. The demonetization does not solve the problem of the process, which created it. The system that created the black money will remain in place unless that becomes our next attention point. The biggest question is that if 13-15 crore money deposited in banks than where is black money? Might be the answer is here- after using following left out loopholes resulting into irreparable loss: –
 - Government has declared the deposits up to Rs. 2.5 lacs in normal bank accounts & up to Rs. 50000/- in Jandhan accounts without any scrutiny.
 - There are crores of accounts of various individuals in different banks. These accounts can easily be used for conversion of Black Money into White by allowing free flow of deposits below Rs. 2.5 lacs without scrutiny.
 - Our country has a population of 125 crores & if ID cards of 1% people is used than much more than the whole black money in cash can be converted by this mode only. It is pertinent to mention here that up to first 10 days there was no bar on use of one ID card in 'n' number of Banks / branches.
 - Black money can easily be deposited or used showing it Agriculture & other exempted incomes.
 - There is an increase in purchase of Gold in Tons & other costly items for cash both before & after the decision.
 - Another method of converting black money is deposits shown by Religious places like Temple, Gurudwara etc.
 - Forget class struggle. Trust became the social capital, as the poor stood in bank queues for the rich to deposit wads of cash – all below the unquestioned magic amount of Rs 2.5 lakh-into their Jan Dhan Account to be returned, with cut or commission, in due course.
 - India rush to railway counters to book expensive long-journey in old notes. Following cancellation, the refund came into new notes.
 - Since accounts of political parties do not come under RTI or Income Tax, they don't have to disclose the reasons of such deposits. The whole money in cash can be deposited in these types of accounts.
 - Businessmen have paid employees salaries for the next several months- all in old notes and below 2.5 lakh each, the deposit amount banks accept with out question. As media reported that in Gujarat some employees had to leave their debit cards with the as surety.
 - Tax-dodging doctors running flourishing hospitals didn't just pay advance salary to employees; they also placed massive orders for medical supplies and equipment-all in old notes.
 - Other means that are being used for converting black money into white is:
 1. Conversion of old currency into new one by commission agents at 20-40% conversion charges.
 2. Gold being purchased in the four hours window between the announcement and buying gold till mid night as media reported jewellery shops.
 3. Property being purchased & sold against old currency.
 4. Even after 8th Nov Govt allowed to use old money for various payments including Govt Payments / Taxes / Payment of Bank loans & some others. How Govt ensured that use of old currency notes at these places is not use of Black money.

It is pertinent to mention that if the Government does not stop generation of Black Money than this demonetization exercise will not be fruitful & may result into another Big Scam. Even no effect on big fishes & they may escape unhurt. Moreover as per recent estimate only 6% of the black money is kept in the form of cash and therefore much more can be converted & the said objective of the Government may not be achieved. A large quantity of new currency uncovered and caught by Income tax and Enforcement Directorate raids across the country after demonetization have confirmed the fact that demonetization is not the last and whole sole alternative of eradicating black money. Earlier also demonetization was implemented in nine countries & failed to achieve the desired objectives of curbing the black money in majority of cases.

Though this move is not less than “ Misguided Missile fired in Haste” just to have political gain specifically in forthcoming state election but I think we should support in the smooth implementation of the move considering bigger interest of “Great India” as decision has already been taken by Government elected by us only & roll back now will be another disaster.

Fake Currency & Terrorism:-

Terrorism is a frightening threat, so many have lost their lives because of it. Enemies from across the border are running their operating using fake currency notes. It is a part of a larger stratagem, a low-intensity war against the Indian economy by Pakistan's deep state. This strategy gathered pace over the past decade, and counterfeit notes

began flooding the Indian market. The NIA (National Investigation Agency) revealed a nationwide network injecting fake currency notes into the economy. It got the notes forensically analyzed and discovered they were manufactured in regular currency-making machines owned by a sovereign government. It didn't take the NIA long to establish that these machines were operating across the border, in Pakistan. The Indian Statistical Institute, Kolkata, in a report in June this year estimated, that Rs 400 Crore worth FICN (Fake Indian Currency Notes) was in circulation. Between 2012-2015, the government seized counterfeit currency. However it is the single biggest move in recent years to strike at fake currency. It disrupts the production of FICN in Pakistan, and makes redundant existing stocks of fake currency with a vast network of terror funders-the Hawala traders and money launderers. The phase out of these notes is double whammy for Pakistan. It limits the impact of counterfeit notes on the economy and curtails terror funding through FICN circulation in India. While removing black money, in the process it [demonetization] will definitely address the problem areas of terror financing and fake currency. There is illegal money behind terrorist funding. The channel through which the adversary sends in militants and arms is also used to send fake currency." demonetization would impact the terror financing, particularly in Jammu and Kashmir. Terrorist outfits like Hizbul Mujahideen collect donations in Pakistan and then route the money into the State through Hawala operators. "The terror funding module in place right now, will be affected as the terrorist operatives always store money in the form of big currency notes. That money has become a piece of paper now,"

No doubt there are fake currency notes in circulation. But fake currency, which is in circulation, is which good faith common man in good faith is receiving. So they will suffer not those who are actually culprits for printing & circulation. Other type of fake currency is, which is not in circulation will be dead money for them but this cost them just printing cost nothing else. Moreover Fake currency dealers will not print how Govt will ensure that New Currency Notes specifically Rs 2000 notes. We should understand this is not Rocket Technology. Even new currency notes of Rs. 2000 (though not fake) were found with the terrorists killed recently during encounter. Future stoppage not ensured. And daily we watch news in TV on new fake 2000 currency.

Media's Role:-

One wonders, why the media, especially the TV news-channels, do not focus more on the impact of demonetization on key sectors of the economy. The problem is that sections of the media appear to be obsessively focused on how the political parties will perform in elections which, in India, seem to be taking place at regular intervals in one state or the other. Some national TV news-channels keep coming up with opinion polls and not just in the states where the next round of assembly elections are due. These channels also give us once-in-six-months opinion polls which seem to tell us how many Lok Sabha seats the ruling and opposition parties and alliances could win if general elections were held at that point of time.

Which could be why many TV news-channel discussions focus not so much on the economics of demonetization as it affects the people but the political impact on the ruling and opposition parties. Instead of economists and representatives of non-political associations of farmers and of trade and industry (including those belonging to the medium and small-scale sector and which could be more affected by a liquidity crunch), the TV news-channels have spokespersons from the BJP, the Congress, the Left, the SP, the BSP, the JD (U) and the AAP. The next round of assembly polls could indicate how the people feel about demonetization in those states where elections are due. However, the real media focus could be on whether the people and especially the vulnerable and economically weaker sections throughout the country are able to get through the present before they reach the safety of a future when things will hopefully get better.

Five years ago, during the peak of Anna Hazare & Baba Ramdev led agitations against corruption, public anger across India was palpable. Literally millions of people in all cities and towns of India would throng local protest destinations with many of them joining in the evening after finishing their day jobs. 'Celebrated' news anchors like Barkha Dutt of NDTV who had then recently covered civil unrest in far off countries like Egypt were unable to even visit these protest sites because public anger was also directed towards them. Majority of the media narrative of that time was more stooped in disbelief laced with skepticism about the impact of these agitations on "real India".

After, 5 years, once again there are crowds thronging to banks and ATMs in millions every day mostly in an orderly fashion. Most Indians have been heavily inconvenienced due to government's demonetization, yet there are no mass protests in the cities and towns of India. Today, the media narrative though is the exact opposite to what it was some 5 years ago. Media, news anchors and columnists are working overtime to build a narrative of a manufactured anger

of the masses but with little or no impact on the ground. The contrast from 2011 to 2016 in the interplay between 3 primary players – media, public and government – couldn't have been starker. While public and govt. were at loggerheads in 2011, media was by and large with the govt. whereas in 2016, public and govt. seem to be in harmony while media is seen to be against the government (media here mostly refers to the dominant mainstream English language version). These are interesting inflection points, which suggest demographic pattern shifts in tandem with a media created dystopia.

The global attitude survey by PEW research shows a clear pattern of Indian public anger of 2013 turning into contentment of 2016, which has been consistent with our own polls and data over the last 3 years. Prime Minister Modi has consistently brought about an attitudinal shift in public's perception of the government. Globally, one of the biggest cause of public anger today has been because of the building distrust in institutions – we have seen just this month how voters in the US, the lone surviving superpower, have shown their massive distrust in institutions by electing a complete outsider to challenge the establishment.

“Yeh Modi kissi ka sagga nahi hai” averred a card carrying Youth Congress worker over a cup of tea near Meerut when he was explaining to us about how possibly the trader community which was supposed to be the core BJP-RSS support base would react adversely to the central government's demonetization move. That same Youth Congressi then added as an afterthought, *“Yeh (PM Modi) shayad desh ke liye kuch bhi kar sakta hai”*. His broader analysis was basically that Modi could have hurt his own party by doing the “right thing” due to the resultant anger among BJP's core voters.

In this reaction of even ideologically opposed sections of the populace towards the Prime Minister, we find that quantum leap that Modi has taken over other politicians. In an environment of cynicism where ordinary people whose default perception mode is to simply disbelieve a political leader meet the best of intentions by a politician with doubts and conspiracy theories, Modi is slowly bringing back that much needed trust. At a fundamental level, the demonetization of 500 and 1000 rupee notes is about bringing back faith in the institutions to ordinary Indians who simply believed everybody is corrupt.

“Very quickly all the pain of standing in queues would be forgotten, but these new 500 and 2000 rupee notes would keep reminding this generation every day about Modi's fight against black money” was how a retired government teacher standing in a long queue of an ATM in Mohali summed up the situation to me. Essentially, the reason why vast majority of ordinary Indians are willing to bear this short-term pain of sudden cash crunch despite no tangible gains is because they have taken that leap of faith with Modi who is trying to restore trust in institutions once again.

In fact, that same PEW research data (survey conducted before demonetization) reveals a subplot of the larger Modi story. Among various positive aspects of Modi's prime minister ship, there was one possible sore note – only 49% people believed that the PM had shown an ability to “get things done” while 33% felt he had failed in that aspect. A perception was gaining ground that despite his best intentions; the PM was being bogged down by the system around him. We believe that Modi understood this much better than anybody else and in a matter of 1 month he has probably completely changed that perception by first conducting a surgical strike against Pakistan and then boldly going ahead with demonetization.

The real focused concern of the media could be on how demonetization affects the people and not just political parties which rely on ‘anonymous’ cash donations and which may have been hit by the November 8 scrapping of 500 and 1,000-rupee notes. The print, electronic and social media has been praising Prime Minister's masterstroke by which he has reportedly destroyed the base of corruption in India. Before the advent of TV as a medium of information, the information requirements of most household was met by the daily newspaper, commentary and analysis through weekly or monthly magazines. Decades back, Marshall McLuhan, at infancy of the television medium had understood its intrusive character. Indian television, both English and vernacular, which started of mostly to entertain has now become increasingly didactic, stridently so. It perceives its role as one of ‘engineering change’. While many anchors pursue their own hobbyhorses, the compulsion to ‘convert’ the audience to there own perspective in increasingly evident. While TRPs the operative mantra, it is subtly intertwined with the anchor's desire to project loudly a particular point of view. It is interesting to see how each such public affairs chat show has its own character, depending on the anchor, participants, issues and relative political temperature in which is discussed. Some debates are dominated by emotions, some by facts, others by logic or reason- however, partnership is the permanent flavor. It is equally interesting to note how the nature of coverage by the media, subtly changes

with perceptions of changing political fortunes of parties and personalities. In case of demonetization media show different stories for example on Zee News 'nobody suffer' by this demonetization, AajTak showed people are suffering in front of ATMs and bank and people died in row reported by NDTV.

In social media lots of jokes and messages about the impending failure of government policy on demonetization are being shared. One point which is expressly missing in all these messages is the need for introspection by "we the society". No policy is perfect and no implementation can succeed without support from the very stakeholders for whose good it is meant. "We the people of India" are determined to make this initiative to failure. Here 'We' simply means, we Indian as a society. Every morning the newspapers report of cash being found (hoarded), in old and new denominations. The amounts are so large that I cannot relate to the numbers. Bankers, Bureaucrats, Politicians, Police, Builders and Cooperative Banks the list is unending. It seems that who so ever has got an opportunity to cheat the nation, has cheated, using his/her full potential. Even the poor common man, who allows his bank accounts to be used or the jeweler who back dates invoices. It appears that 'we' are determined to make the initiatives fail...and then gloat and "blame the government".

The failure will not be the defeat of the government, nor will it be a defeat of initiative. It will defeat of our India by 'us', its citizens. It's very sad. There are always two sides of coin. Don't try to look at things theoretically or from one side. Science also says "Balanced Diet is good for health." There are some channels, which are showing only good face of decision; some are showing mixed or other sides. But it's a practical approach to see real ground level reality.

Conclusion: -

It is no coincidence that 'Notebandi', the demonetization of high-value notes by the P.M. Narendra Modi Government, sounds a lot like 'Nasbandi', the infamous sterilization drive during the Emergency under Indira Gandhi. With long queues outside ATMs that seemed perpetually dry, the country has almost been cashless since P.M. Modi announced the demonetization on November 8, 2016. Ironically that timed perfectly with his campaign for a cashless India or as he twisted it, a less-cash India. Black money will soon be generated in new currency. This may be why the government narrative has changed from unearthing black money to making India a cashless economy. If it is to be considered a modern nation. Again, a laudable goal! At present, minuscule 2% transactions are digital, compared to advanced economy like the US, where it is 45%. It is not clear how much of the cash RBI intends to replace. But if the cash crunch continues, this will be a prolonged painful process, causing much suffering to the poor. The challenge for India to make more digital payments is enormous. The reflections are showing. India is a country of *Jugaad*, as seen with money launderers. As IT Minister Ravi Shankar Prasad is fond of saying: 'Indians first observe technology, then they adapt it, and after that they adopt it. Hopefully this is true. As cashless economy became the main focus, the talk of black money and counterfeit currency took a second place in the government's scheme of things.

Following are some effects after demonetization media didn't show and hid from people-

1. 100% Fake currency out of circulation in one stroke and Hawala sources from outside and Inside dried up for Funding of Terrorists, Maoists, Naxalites, Jihadis. Cash to create chaos and terror lying with Terrorists, Maoists, Naxalites, Jihadis gone waste.
2. Kashmir back to normal in one stroke. AAZADI forgotten. Children back to school. 95% turnout in J&K for exams and no schools have been burnt or no stone pelletiers to be found.
3. Jan Dhan accounts are full with money (more then 1 lakh transaction will cease to be BPL account)
4. India has around 13 lakh crore denomination of old 500 and 1000
5. 6000 crore cash deposited by only one Gujarati businessman. He has paid around 5k stipulated tax and penalty also on it.
6. All business men are depositing cash lying with them as current your income with ADVANCE TAX
7. All Jewellers are being issued Forms to declare their GOLD STOCK from 8th November onwards on day-to-day basis and all Jewellers whose stock doesn't not match with old record will be screwed big time.
8. Via Jewellers all those who have bought Gold will also not escape Income Tax net.
9. 55 lakh money disputes settled in one day in Lok Adalat.
10. Defaulters of Banks, Property Tax, Electricity bills, Telecom bills are clearing their long pending dues.
11. Defaulters of all kind of Govt taxes are clearing their dues
12. Govt moving towards Target of Cashless economy

13. Lot of small vendors has started using Apps like Paytm, Wallet facilities. Also installing Credit /Debit machines.
14. Banks are asking and guiding people to become cashless.
15. Businessmen with less black money declaring their money as Current your income and depositing with Advance Tax.
16. All with loads of Black money in cash either will surrender money with tax and Penalty or destroy it.
17. Next cleaning going to start with declaration of Benami Properties
18. Only 2 options –Either claim property and pay tax or give it up
19. All those people who are exchanging money of rich for 30% commission will lose their BPL status if transaction in their account is more then 1 lakh. All others will have to pay tax and penalty on money deposited above 2.5 lakh.
20. Fiscal deficit of India set to reduce. Even it will lower the prices of essential commodities, help in reducing the interest rate, contain inflation and not only fiscal deficit but also help in lowering CAD (current account deficit) and narrow down the trade deficit.
21. Banks have started mobile ATM for Hospitals.
22. 19 Banks have come together to start Unified online transaction.

The demon in demonetization is in the beginning. The need for the government to keep the move a secret so that tax evaders wouldn't be alert before the demonetization took place affected preparedness. This is no doubt that the coming months will be painful for the common man, small business housewives, etc. as there will be some shortage of legal tender /currency that will have an impact on them. Online trade can also be affected. There is some trouble for the economy, but not too long lasting said Ajit Ranade (Chief economist with Aditya Birla Group). Another rising issue will be that POS machine, debit cards which has to be resolved first, otherwise the measures will become an obstacle rather than the solution.

But after having discussed so much, will this major eliminate all the black money in the economy? This answer simply would be confirmative NO as it has been seen that black money is stored in various forms other than cash and as per 2012 report prepared by National Institute of Financial Management on unaccounted income found that cash was the least preferred option for storing unaccounted wealth. P.M. Modi has endeavored to strike at the root of black money menace and silence his critics to an extent. But his biggest challenge will be to ensure that the ship of state recovers quickly from these sudden shifts in policy direction. Demonetization, though welcomed by a largely enthusiastic public response in support of strike on black money, later invoked criticism on account of inconvenience caused by it to various section of the society. Yet, such criticism is also muted and overall, the sentiment has been of support to the government's initiatives with suggestions for improvement in implementation. It exhibits people's trust in the action of the government and it needs to be pointed that such trust is hard to be earned and easier to lost. The possibility of later would be a tragedy not only for the political dispensation at helm but also for the future of political and economic reform in India.

If these measures are implemented efficiently then we can expect higher collection of taxes, higher investments in the market, price corrections, improvements of India in some of the international rankings prevent corruption practices etc. and these are some of the reasons why people although are going through difficulties are lauding this measure of the government.

Abstract

Soil is a mixture of organic nutrients, which provides nutrients for plant growth. Plants require N, P & K for their growth and vegetative propagation. Among vital nutrients, Phosphorus is less available to plants and microorganisms aid in phosphate solubilization. The present study is an ecofriendly method to induce phosphate solubilization in Rhizosphere soil. Totally 25 isolates were isolated from rhizosphere using Pikovskaya medium and screened for phosphate solubilization using Tricalcium phosphate supplemented minimal medium. Of these, *Aspergillus* sp and *Penicillium* sp were found to produce remarkable solubilization index. Hence these two isolates were used for further assays. Enzyme assay was carried out to determine the enzyme activity using cell free extracts and the activity was analyzed by spectrophotometry. In addition, HPLC also performed to determine the end products of phosphate solubilization. The results of HPLC studies revealed that tricalcium phosphate was solubilized into organic acids like citric acid, gluconic acid and malic acid. The results of present study are an evidence for the production of organic acids by *Aspergillus* sp and phosphate solubilization which induce crop improvement as well as sustainable agriculture.

Introduction:-

Phosphate is an important nutrient for plant growth and development. All plants require phosphate for metabolic activities like nucleic acid synthesis, respiration, energy production, energy storage and transfer, cell division and cell growth. Phosphorus fertilizers when applied during the early stages of plant growth promotes early root formation, and is important for development of primordia for reproductive parts of plants. Seed formation requires phosphorus and its content is higher in seeds than in any other part of the plant. It improves survival of plants in winter climates. Phosphorus is available in rocks primarily as minerals like oxypatite, hydroxypatite and apatite. These are highly insoluble and constitute about 40% of total phosphorus in Indian soils. Indigenous microorganisms convert insoluble phosphates into soluble phosphates and aid in the bioavailability of phosphorus. Phosphate solubilizing microorganisms assimilate phosphorus and release them to plants. Phosphate solubilization is a complex phenomenon which highly depends on many factors such as nutritional, physiological and growth

conditions¹. Bacteria such as *Pseudomonas*, *Alcaligenes*, *Rhizobium*, *Serratia*, *Erwinia* are capable of phosphate solubilization².

Mechanism of mineral phosphate solubilization by PSB strains is associated with the release of low molecular weight organic acids³, which through their hydroxyl and carboxyl groups chelate the cations bound to phosphate, thereby converting it into soluble forms. There is experimental evidence to support the role of organic acids in mineral phosphate solubilization⁴.

Phosphate solubilizers possess enzymes that convert insoluble phosphate into soluble phosphate. Phosphate solubilizers like soil fungi are capable to produce extracellular enzyme, i.e. group of phosphatase enzyme which are able to mineralize organic P into inorganic P so that high P is available for plant. There are several soil phosphatases and the most commonly determined are: phosphomonoesterases, phosphodiesterases and phytases. Phosphomonoesterases act on phosphate monoesters and according to their optimum pH are divided in acid and alkaline phosphomonoesterases⁵. Both are adaptive enzymes: acid phosphomonoesterase predominates in acid soils while alkaline phosphomonoesterase predominates in neutral and basic soils⁵.

An ecofriendly approach towards converting insoluble phosphates by potential phosphate solubilizing fungi from the soil is inevitable. The present study was designed to determine alkaline phosphatase activity of indigenous fungi from the natural rhizosphere soil.

Materials and methods:-

Isolation of phosphate solubilizing microorganisms:-

The serially diluted soil samples were placed on standard agar medium (pH 6.8-7.0) containing tricalcium phosphate (TCP) as sole phosphorus source for selectively screening the bacteria which have the ability to release inorganic phosphate from tricalcium phosphate. After 3 days of incubation at 25°C, phosphate solubilizing fungi developed clear zones around colonies. Colonies with clear zones were further purified by replating. The isolation of phosphate solubilizing fungi by serially diluting the soil sample and plating method using Pikosvikyos agar medium supplemented with Tricalcium Phosphate.

Identification of phosphate solubilizing Microorganisms fungal identification:-

The morphological identification of fungal isolates were done by the methods described in experiments in Microbiology, Plant Pathology and Biotechnology.

Phosphate Solubilization activity:-

(Ngugen *et al.*, 1992)

The bacterial and fungal isolates were screened for inorganic phosphate solubilization. A loopfull of fresh bacterial and fungal cultures were streaked on to Pikosvikyos agar medium inorganic phosphate and plates were incubated at 28 ± 2 °C for 3 days. After 3 days, the colonies showing the clear halo zone around them indicated solubilization of mineral phosphate. Phosphate solubilization activities were screened by measuring the clearing zone surrounding the developed bacterial colony via calculation of phosphate solubilization index (Nautiyal, 1999).

Phosphate solubilization Index = $A/B \times 100$.

A= total diameter (colony + halo zone).

B =diameter of colony.

Identification and Characterization of Phosphate Solubilizing fungi.

PDA was used to accelerate the growth rate and the production of enough conidia as reported by Diba et al. The characteristics of fresh cultures were compared with mycological identification keys and taxonomic description to identify the isolated fungi to the genus level. Identification was based on colony characteristics and microscopic features, among the colonial characteristics such as surface appearance, texture, and colour of the colonies both from upper and lower side. In addition, conidia, conidiophores, arrangement of spores, and vegetative structures were determined with microscopy.

The identified fungi were maintained on Potato Dextrose Agar (PDA) slant at (4°C) for further investigation. Slide culture was prepared in order to identify spores and mycelia of pure fungal isolates and identified by lacto phenol cotton blue staining using microscope and identified after growing them on slide according to Stevens et al

Results and discussion:-

Fungal isolates were identified by observing colony characteristics on RBCA plates. Growth pattern of the isolates were identified as *Aspergillus* sp and *Penicillium* sp (Fig 1,2). Further it was confirmed by microscopic analysis of colony using lacto phenol cotton blue staining method.

Solubilization index for the 24 isolates was in the range from 0.5cm-0.10cm. solubilization index for *Pseudomonas* sp was observed as 0.9cm^{10,11} and present study also revealed that fungal isolates was 0.6cm for *Aspergillus* sp and 0.5cm for *Penicillium* sp.

In liquid media, fungal isolates produced acid in high amount which is evident from decolourization of broth. Phosphate solubilization by these isolates was observed for 28 days. Quantitative estimation revealed that solubilization initiated after 3 days and was highest on the 7th day. Decrease in pH was observed in all the isolates. Phosphate solubilization was observed in the range of 100µg ml⁻¹ to 250µg ml⁻¹. Maximum phosphate was solubilized by *Aspergillus* sp (190µg ml⁻¹), and also it produced significant amount of citric acid, gluconic acid and moderate amount of oxalic acid. Organic acids were also produced including succinic, glycolic and malic acid in small amounts. *Penicillium* sp solubilized phosphate (150µg ml⁻¹) and also produced low levels of glycolic, citric, succinic, gluconic and oxalic acids.

Phosphatase activity:-

Phosphatase activity of fungi (*Aspergillus* sp and *Penicillium* sp.) were higher than bacteria¹⁰. Phosphatase activity of fungi (*Aspergillus* sp and *Penicillium* sp.) were higher than bacteria (*Pseudomonas mallei*, *Bacillus subtilis*) as reported earlier¹¹. *Aspergillus* sp solubilised phosphate into organic acid and accumulated organic acids having retention times of 5.5 (approximating the retention time of citric acid), and 7.1 min. *Aspergillus* sp isolate also accumulated a small amount of organic acids having retention time of 7.8 min (approximating the retention time of malic acid), and 8.3 min. *Penicillium* sp accumulated malic acid. The results of the present study revealed that *Aspergillus* sp proved to be an efficient strain for phosphate solubilization and *Penicillium* sp needs small genetic manipulation. In addition, no significant amounts of organic acid production was observed from a phosphate solubilizer fungus, *Penicillium* sp¹². Tricalcium phosphate induced extracellular phosphatase production (119U/ml) compared to other phosphate sources^{14,15}, similar result was observed when tricalcium phosphate was added (10g/l) in the medium. Phosphatase activity by fungal isolates was maximum in the pH 4.0-6.5, which was similar to the results obtained during optimization studies¹³ for *Trichoderma* sp

The physico chemical characteristics of soil such as pH was neutral, the nitrogen content of the rhizosphere soil was found to be low, while the amount of Potassium in soil was quite high and phosphorus content was also low^{14,16,17}. The results of the present study on soil properties were in agreement to the results obtained by¹⁵ which reported that the fertility of soil was moderate.

Conclusion:-

Two phosphate solubilizing fungi were isolated and identified as *Aspergillus* sp and *Penicillium* sp. Phosphorus solubilization activity of PSM is associated with the release of organic acid and a drop in the pH of the medium. In the present study, there is a decrease in the pH values of the Pikosvikiyos media because of the release of organic acids in the cultural medium. Furthermore, the results of HPLC studies revealed that fungi solubilizes Phosphate into organic acid viz., Citric acid, Gluconic acid, Glycolic acid, Malic acid, Succinic acid and oxalic acid, which is evident from their retention time. Consequently it was proved that the isolated *Aspergillus* sp and *Penicillium* sp have the ability to solubilize phosphate which was confirmed by its phosphatase activity. Further molecular characterization of the isolates will provide their genetic relationship with other phosphate solubilizers.

Solar Still, Reflector, Productivity, Solar Distillation

Abstract

The solar still is an errorless well spring of freshwater for farming and drinking in far away, widely different areas or islands. There are great numbers of sort of solar stills the least difficult and most put examples on view of is the basin solar still. Observations put examples on view of that the common still has limited amount produced. Researches have taken determinations to make different designs of solar stills to get well the amount produced and got knowledge by reasoning that solar stills incorporated with reflectors are the most efficient and effective Designs The reflectors, either outside or inside, are a good and cheap modification to increase the solar irradiation given direction to the basin liner or the water along with the distillate efficiency of the still. In this paper, a wide measures taking for different solar stills with reflectors has been showed.

Introduction:-

People existing in isolated areas or islands, where freshwater source by transport is costly, face the problem of water scarcity every day. Solar still offerings specific advantages to be used in these ranges due to its easier production, minimum skills of operation and preservation requirements, and responsiveness to the environment. The clean free and ecofriendly to the environment are two major benefits which strengthen the use of solar stills. The main drawback of solar stills is the low production of freshwater in comparison with the other distillation systems. The production volume for a simple type solar still is only between 2–5 /m²/day. This makes the solar stills uneconomic compared to the other conventional distillation systems [1]. Many researchers have reviewed, comprehensively, the latest work on solar stills such as classification [2], design [3], improvement techniques [4], passive [5], active [6], inclined [7], stepped [8], wick type [9], and condensers with solar stills [10]. There is no specific manageable survey on solar stills with reflectors. Along these lines, this work is to make a documental study on the solar stills combined with external reflectors and internal reflectors.

Conventional Solar Still with Reflectors:-

Internal reflectors are suitable tools to concentrate and transmit solar radiation. They are suggested when sunlight is weak or the local temperature is comparatively low. External reflectors are ideal to be used to change the direction of solar rays to improve the flexibility of the absorber plate configuration such as vertical solar absorber plate which helps to recover the vapor latent heat of condensation. External and internal reflectors are suggested when sunlight is weak or the local temperature is discreetly low shown in Figure no 1.

Categorization of reflector with solar stills:-

To get high distillation production, scientists introduced many efforts to make different design of solar stills. They concluded the solar still integrate with reflectors is effective and efficient. The reflectors with solar stills can be distributed into three types (1) internal reflectors (2) external reflectors both top and bottom, and combination of internal and external reflectors. To utilize the external and internal reflectors can be an economical method to expand the solar irradiation incident on the basin liner to make high productivity as possible. A simple valuation of different solar stills with reflectors is showed in Table no 1. The evaluation based on location, daily productivity, yield improvement and efficiency.

Internal reflectors (IR):-

The reflectors inside the solar still affect significantly the output of distilled water, which is credited to the centralization of the reflected solar radiation incident on the water. Besides, reflectors decrease the waste heat energy from solar still. Tamimi [11] studied experimentally the performance of a single slope solar still

Figure 1:- A Solar Still basin with reflector

Single basin solar still with mirrors installed on the side walls of a still. They concluded that by using mirrors the basin efficiency increases during the whole day. El Swify and Metias [12] used scientific modeling and conducted experiments to find out the effect of internal reflectors on the back and side walls of a single slope solar still with its back wall acting as an additional condenser showed in Figure No.2. They mentioned that the distillation increase of 80% & 20% can be obtained from installing reflectors in the summer and winter season, respectively. New designs of solar still consist of a metallic cylindrical parabolic reflector studied by Minasian et al. [13]. The reflector was design to concentrate incident solar radiation on the black outside surface of a tray located on the focal line of the reflector. The tray was lined with blackened wick, which represents the evaporative surface of proposed still which was shown in Figure no. 3. They showed that the productivity of the latest still was 23–33% greater than that of a conventional basin type solar still. Abdallah et al. [14] provides the modified basin solar still. The design modification was fix the interior reflecting mirrors on the internal walls of the still to minimize the amount of energy lost shows in Figure no 4. The experimental result was shows that the use of internal mirrors improved the system thermal performance up to 32%. The solar still design was modified from flat basin to stepwise basin and the efficiency increases by a normal value of 185%. AlHayek and Badran [15] compared the performances of a double slope basin solar still and a single slope basin solar still. The inside surfaces of complete walls were made of mirrors. They performed their experiments during July and determined that using mirrors on the inside walls of the single slope basin solar still improved the production of distilled water by 18% higher than the double basin solar stills. The effect of an internal reflector on the production of a single slope solar still (during the winter and summer)

was examined experimentally and theoretically by Karimi et al. [16]. They presented a scientific model considering the effect of all walls (east, west, north and south) of the solar still on the amount of received solar radiation to brine. The model was validated with the experimental data. The model can calculate the yield of the still with and without Internal Reflector on various walls. The result shows the simultaneous use of Internal Reflector on front and side walls enhances the solar still efficiency by 16%. Though, installation of an Internal Resistance on the back wall can increase the annual efficiency by 20%. The installation of Internal Resistance on all walls in comparison to a still without Internal Reflector can increase the distillate production at winter, summer, and the entire year by 60%, 20%, and 31%, respectively. Modification of the stepped solar still over installing Internal Reflector on the vertical side which was introduced by Omara et al. [17]. The productivity of the stepped solar still with Internal Reflector was higher than that without the Internal Reflector. The results also indicated that the productivity of the modified stepped solar still with and without Internal Reflector is higher than that of the conventional solar still by almost 70% and 50%, respectively. Also, the efficiency of the stepped solar still with reflectors and without reflectors was 54% and 51% respectively, whereas, the efficiency of the conventional solar still was only 32%. The performance factors of the Corrugated Solar Still (CSS) and Conventional Solar Still (CnSS) were studied experimentally by Omara et al. [18]. The author's view concerns with using both double layer wick material and reflectors composed inside the CSS, Figure no 5. In addition, the influence of saline water depth (1.5, 2.5, and 3.5 cm) on CSS performance was also studied. During investigations, the product of CSS with wick and reflectors is about 146% higher than the CSS at a brine depth of 1.5 cm. In addition, the daily efficiencies of CSS and CnSS were approximately 60% and 35%, respectively. In other experimental study by Omara et al. [19], a hybrid solar distillation system covering of corrugated and wick absorbers of solar stills was combined with an external condenser and internal reflectors to study their performance. They showed that the productivity of corrugated wick still with reflectors and external condenser was improved by about 182% over CnSS at a brine depth of 1.5 cm.

Figure 2:- Double Exposure solar still With Internal Reflectors.

Figure 3:- Basin solar still with cylindrical parabolic reflector.

External reflector (ER):-

The external reflector used in the solar still is made up of greatly reflective materials such as mirror finished metal plate. The diffuse and direct beams transmitted over the glass cover are improved by using the ER. Scientist (Hiroshi Tanaka) is the most concerning to study the effect of reflector on the distillate of stills.

External top reflectors:-

Tanaka et al. [20–22] showed numerical investigation on a tilted wick solar still with a top mirror (vertical [20], forwards [21] and backwards [22]) extending from the upper edge of the still. They displayed geometrical models to compute the solar irradiation reflected from a top mirror and then absorbed on the evaporating wick. They concluded that the top mirror can increase the absorbed solar radiation by evaporating wick, and added, the amount of solar irradiation reflected from the top mirror and absorbed on the wick can be enhanced by inclining the top mirror to be backwards in summer and forwards in winter. A theoretical analysis was used by Tanaka and Nakatake [20] to study the effect of a vertical flat plate External Reflector on the productivity of a TWSS and shows the average increase of

10% in a year. Another theoretical analysis of a top External Reflector with TWSS on a winter was investigated by Tanaka and Nakatake [21]. Their results indicated that the productivity of a still with an inclined reflector would be around 12% or 25% over that with a vertical reflector when the reflector length is a half of or the same as the solar still length. In adding, a theoretical analysis was made on TWSS with external top reflector with the aim of determining optimum inclination for both reflector and solar still for different seasons by Hiroshi Tanaka [22], Figure No 5. Regarding to the results obtained, 30°N latitude was represented as the best inclination angle either for the still or the reflector monthly. In addition, he concluded that for any season the daily productivity of the solar still can be improved by adjusting the inclination of both the reflector and solar still, thus producing around 20% over the traditional TWSS throughout the year. Tanaka and Nakatake [23] displayed another theoretical investigation of one step azimuth tracking TWSS with a vertical flat plate reflector. The TWSS is assumed to be rotated manually just once a day at southing of the sun. They performed numerical analyses of heat and mass transfer in the still to determine the daily productivity of the still on four typical days: the spring and autumn equinoxes and summer and winter solstice days at 29°N latitude. For four days, results indicated that the increase in the productivity of TWSS would be around 40%, and can be accomplished by the simple modification of utilizing a reflector. El-Bahi and In an [24] examined a conventional still integrated with an outside condenser in Figure No 6.

Table 1:- Simple comparison of different solar still with reflectors

No	Categorization	Authors	Locations (Latitude)	Reflector material	- Daily yield (kg/m ² /d) - Improvement - Efficiency	Reflectors effect (%)	Observations in experiment
1. Internal reflectors							
1	Conventional still	El-Swify et al. [12]	Cairo, Egypt (25° N)	Mirrors	3.05–7.2 82.6% in winter 22% in summer –	82.6% 22%	The cooling effect of the back glass cover, back condenser, is improved due to the higher temperature difference as compared to the ordinary one.
2		Minasian et al. [13].	Baghdad, Iraq, (33.33°N)	Stainless steel	1.23–6 25–35% –	25–35%	The productivity of the conventional basin type solar still has been increased by using a stainless steel cylindrical parabolic reflector.
3		Abdallah et al. [14]	Amman, Jordan, (32°N)	Mirrors	1.64 30% ~	30%	Installing internal side mirrors gave better performance because these mirrors make use of the energy reflected on all sides of the solar still.
4		AlHayek and Badran [15]	Amman, Jordan (32°N)	Mirrors	– 20% 11%	20%	Performance characteristics of the stills showed that the temperature at the water surface is increased with decreasing water depth, and by the addition of dye.
5		Karimi et al. [16]	Iran. (30°N)	Mirrors	– 34% –	34%	The installation of IRs on all walls in comparison to a still without IR can increase the distillate production at winter, summer and the entire year by 65%, 22% and 34%, respectively.
6	Stepped solar still	Omara et al. [17]	Kafrelsheikh, Egypt, (31.07°N)	Mirrors	6.35 75% 56%	18%	Productivity of stepped still with and without internal reflectors was higher than the conventional still by 75% and 57% respectively.
7	Corrugated wick solar still	Omara et al. [18] and [19]	Kafrelsheikh, Egypt, (31.07°N)	Mirrors	4.1 145.5% 58%	55%	The yield of Corrugated wick solar still with reflectors when providing a vacuum was enhanced to about 180% higher than the conventional still.

2. External reflectors**External top reflectors**

8	Tilted wick solar still	Tanaka and Nakatake [20]	Kurume, Japan (33°N)	Mirrors	– 9% –	9%	The average daily amount of distillate for four days, (spring and autumn equinox and summer and winter solstice days), peaks when the angle of the still is 20° for the still with the reflector, and peaks at 30° for the still without the reflector.	
9		Tanaka and Nakatake [21]	Kurume, Japan (30°N)	Mirrors	4.2 15% –	15%		The inclined reflector can increase the distillate productivity of the still at any still's inclination, and the reflector's inclination should be set at about 15° from vertical.
10		Tanaka [22]	Kurume, Japan (30°N)	Mirrors	– 21% During the year –	21%		The distillate can be increased by inclining the reflector backwards in winter and forwards in summer, and the inclination angle of the reflector would be less than 25° throughout the year.
11	Conventional still coupled with external stainless steel reflector and outside condenser	E1-Bahi and Inan [24]	Ankara, Turkey, (39.6°N)	Stainless steel	–	–		The efficiency of the solar still was improved up to more than 70%, and the distilled fresh water was up to 71/m ² .d when a solar still coupled with an external stainless steel reflector and outside condenser
12	Conventional still	Shanmugan et al. [26]	Tamil Nadu, India (11.30°N)	Mirrors	4.2 – 45	–	The efficiency of the still was as high as 35%, and increased to 45% with the mirror booster. The twin reflector booster has to be reoriented only once in a day at mid-noon. The main advantage of the “V” type solar still is due to center collection and all the condensation are easily directed to the outlet.	
13	Conventional still With twin reflector	Srivastava et al. [27]	Rewa India (24.32°N)	Mirrors	79	79%		
14	“V” type solar still	Selva Kumar et al. [28]	India (22°N)	Mirrors	2.7 7.3 12	7.3%		
External bottom reflectors								
15	Double slope single basin solar still	Sebaii [29]	Tanta, Egypt (31° N)	Mirrors	– 19% and 30% summer and winter –	19% and 30% summer and winter	The daily productivity of the double slope single basin solar still with mirrors is higher than that without mirrors, due to the increased basin	

Figure 4: basin solar still with Internal Reflector

Figure 5: Top reflector with TWSS

Figure 6:- Conventional Still integrated with top reflector.

Figure 7:- Basin solar still with reflector and external condenser.

A reflector made of stainless steel was added to the glass cover to reflect the solar radiation into the still basin through the glass cover and to give a shadow for the condenser. The study led to the conclusion that the efficiency of the solar still was enhanced by about 72% and the daily productivity was up to 7 l/m^2 a day. Madhlopa and Johnstone [25] proposed a model to calculate the distribution of solar irradiation inside a conventional still with reflector and external condenser, Figure no 7. The system had one basin in the evaporation chamber and two other basins in the condenser chamber. It had a glass cover over the evaporator basin and an opaque condensing cover over basin 3. Water vapor from the first basin condenses under the glass cover while the remainder flows into the condenser by purging, diffusion, and condenses under the liner of basin 2. They found that distilled freshwater was about 2.1 kg/m^2 a day. The performance of an acrylic mirror boosted solar distillation unit was studied by Shanmugan et al. [26]. The performance of solar still in terms of distilled water collection has been analyzed and a booster mirror (acrylic) was attached just above the glass cover of solar still. The mirror boosting reflects the excess solar radiation to water and it is possible to adjust the booster mirror for perfect reflection depending upon the sun moving angle. The maximum amount of water collected per day was about 4.1 L. The efficiency of the still was as high as 33%, and increased to 43% with the mirror booster. Srivastava et al. [27] performed experiments of a modified solar still with multiple low thermal inertia porous absorbers, Figure no 8. The absorbers were made up of jute cloth and they float on the basin water with the help of thermocol insulation. The surfaces of the absorbers were always wet and hence there were no dry spots. The results showed that the productivity was 66% more than the conventional still and 33% more on cloudy days. The basin water below the floating absorber remained warm during offshine hours, and hence, the distillate was produced even at nights. A twin reflector booster was placed perpendicular to each other on the modified stills. The productivity increased by 77% over the still without booster. The thermal performance of a “V” type solar still with a charcoal absorber was analyzed by Selva Kumar et al. [28]. The main advantage of this type of still is that the distilled water collection was directed towards the central water collection channel as shown in Figure no 9. The production of the outlet distillate water had increased. The overall efficiency was found to be 25% and 12% for the still without and with the boosting mirror, respectively. He also conducted similar experiments which were carried out for the charcoal absorber in the still without and with the boosting mirror which yielded 30% and 14% respectively.

Figure 8:- Twin reflector booster applied to solar still.

Figure 9:- V type solar still with External reflector.

Scope for further research:-

There are still some problems and challenges on the design of solar stills not being clearly analyzed for performance improvement, including solar stills with reflectors. This paper reviews the studies and developments of solar stills with reflectors. The results from the preceding work done clearly show that the enhancement of solar stills with reflectors performance differs greatly for different techniques due to different experimental conditions. The review represents specific inferences drawn from the analyses of solar stills with reflectors by various authors to pave way researchers to grasp the previous designs and to fabricate new designs with optimum design parameters for higher distillate output.

The following factors may be taken into consideration for further research of solar stills with reflectors:

For active solar still:

- 1.1 Combine solar still with solar water heater in order to increase the basin temperature.
- 1.2 For active solar stills, more research may be carried out with reflectors.
- 1.3 Further studies should be conducted to improve the solar stills productivity, especially in the fields of coupling with heat storage and various waste heat sources.

For tracking system:

- 1.4 Solar still with azimuth sun tracking and just an adjustment of the optimum elevation of the day.
- 1.5 Combine the solar still with sun tracking and the solar water heater.
- 1.6 The sun tracking system is more effective than fixed still and it is capable of improving the distillate output of the still with reflectors.

Conclusions:-

Reflectors are used to enhance the daily amount of distillate of the solar still. The accompanying conclusions can be inferred on the basis of above discussions

- Installing reflectors is more practical in places where solar radiation is weak and the ambient temperature is relatively low.

- Installation angle of the external reflector should be changed with the seasons to enhance the productivity through all the year.
- The external reflector is inclined backwards or forwards according to the month.
- The daily productivity can be increased by adjusting the inclination of both the still and reflector mirror in any season.
- The benefits of both the inclined external top and internal reflectors would be considerably less in summer than in winter.
- For the still with larger angle of the glass cover, the effect of the external top reflector would be smaller.
- The vertical flat plate external reflector would be less effective for the tilted wick solar still than for the conventional still.

adhesion.

Abstract

Objective: To evaluate and compare *streptococci mutans* adhesion on the surface of indirect resin composites compared to direct.

Materials and Methods: A total of forty standardized disk shaped samples of the four tested material were constructed in special mold and cured according manufacturer's instructions and finished and polished with sofex finishing system, then subjected to bacterial biofilm colonization and the adhered bacteria were calculated and, the collected data were subjected to statistical analysis.

Results: One way ANOVA showed that there was a significant difference between the tested resin composites, and the post hoc Tukey's test showed that the lowest bacterial adhesion recorded for SR Nexco and Ceram X one with statistically significant difference compared to Z 250 and Herculite classic (p 0.05)

Conclusion: Indirect resin composites have lower susceptibility to bacterial adhesion than do direct one in the same context the smaller the filler particle size the lowest the bacterial adhesion.

Introduction:-

Tooth colored restorative materials are today preferred due to the patient's demand for esthetic restorations and minimal invasive treatment modes. Although resin composite can be applied directly to restore posterior teeth, it can be also indicated for indirect restorations. In particular for medium to large sized cavities on the condition that sufficient tooth structure remains for adhesive cementation.¹ This restoration strategy is highly required due to the need of marginal adaptation, proximal contacts, anatomic form, color match, polymerization shrinkage and wear resistance controlling.^{1,2}

Indirect composites now offer an aesthetic alternative to ceramics for posterior teeth as inlays and onlays. The mechanical properties of lab composites in comparison to ceramics are inferior, however the aim is not that indirect composites replace ceramics rather that they supplement and complement them dependent upon each individual patient situation.

A brand of indirect resin composites, SR Nexco (Ivoclar Vivadent, Schaan, Liechtenstein) was introduced in 2012. SR Nexco Paste is a purely light-curing laboratory resin composite with high content of inorganic microopal fillers.

This affords optimum benefits in terms of abrasion, discoloration, processing and surface gloss. The balanced ratio between the matrix and filler components results in outstanding physical properties achieved with polymerization units.³ The combination of microfillers plus prepolymer enables a very high filling ratio and excellent physical properties. The use of the prepolymer allows the advantages of large filler particles to combine with those of microfillers. This technology allows for a superior strength of resin composite that if only inorganic microfiller were used.³

The initial adhesion and early colonizing of bacteria to the surface is an important step in the process of plaque formation on solid substrate surfaces such as teeth and restorative materials.^{4, 5} Resin composites have surface characteristics different from those of teeth. Unlike tooth surfaces, the surface properties of resin composite materials related to bacterial adhesion and biofilm formation are affected by a myriad of factors — such as mechanical surface properties, material components such as filler particles and resin matrix, and curing conditions. In particular, matrix monomers might influence the growth of some cariogenic bacterial species^{6,7}

Many studies have reported that composite resins tend to accumulate more bacteria or plaque than do other restorative materials *in vitro* and *in vivo*. Differences in the amount of bacterial adhesion can be explained by the diverse surface characteristics of each type of composite resin.⁸⁻¹⁰

The success of the esthetic restorations on a long-term basis depends on the quality and amount of adhered biofilm are. The initial adherence and subsequent colonization of bacteria on the surface of composite resins is the key of the pathogenesis of the secondary caries promoted particularly by *Streptococcus mutans* (*S. mutans*) and *Streptococcus sobrinus* (*S. sobrinus*). *S. mutans* has been identified as the major etiological agent of human dental caries and composes a significant proportion of the oral streptococci in carious lesions.¹¹ *S. mutans* is harbored in mature plaque. Organic acids are trapped within the glucan barrier produced by these bacteria, resulting in a prolonged low pH around the enamel surface.¹²

Based on the facts described, the aim of this study was to evaluate *S. mutans* biofilm adherence on the surface of, nanohybrid, microfill direct resin composites, and nanofilled, microfill indirect resin composites.

Materials and methods:-

Materials:-

In this study these types of dental resin composite; SR NEXCO (microfill indirect composite Ivoclar Vivadent, Schaan, liechtenstein), Filtek Z 250 (Z 250) (microhybrid direct/indirect composite 3M Dental product, St Paul, MN, USA), Ceram X One Dentsply Deterey GmbH, De-Trey-Str. Germany and Herculite classic Kerr Italia S.r.l. via passanti, Scafati (SA) (microfill direct composite).

Methods:-

Specimens' preparation:-

A total of forty standard disc shape specimens were constructed from the four brands of the resin composite materials indirect microfill resin composite SR NEXCO, indirect microhybrid resin composite Z250 and direct microfill resin composite Herculite classic and nanohybrid resin composite Ceram X One (n=10).

A split Teflon mold was composed of an outer copper ring and split Teflon ring with an internal hole of 10mm diameter and 2mm thickness was used to construct the stranded disc shapes specimens, the mold can be split in two halves and reconstructed by the copper ring.

The selected shade was A3 shade to standardize the degree of polymerization. The filled split Teflon mold was assembled over a glass slide with a thickness of 2mm, covered with a 0.05mm transparent polyethylene film to standardize surface smoothness. The mold space was filled with each test material in a bulk pack technique, avoiding gross excess and entrapping of air, then covered with clear celluloid strip and another glass slide and pressed to remove excess material. The applied materials of the three tested groups was light cured for twenty seconds from each side using light emitting diode (LED) light-curing unit with an intensity of (900 MW/cm²). Then each specimens was light curried from each side for additional twenty seconds after removed of the glass slap and the polyethylene film. After that the indirect resin composite SR NEXCO there was subjected polymerization by special oven Lumamat-100* for ten minutes (Targis Power TP3 Upgrade, Ivoclar Vivadent AG Schaan,

Liechtenstein) using program P2 for 11 minutes in order to complete polymerization according to manufacturer's instructions

The surfaces were smoothed by rubber polishers and silicone polishing wheels, leather buff wheels and Universal Polishing Paste (Ivoclar Vivadent AG Schaan, Liechtenstein).³

Finally, all the specimens in the four groups were finished with flexible discs (Sof-Lex XT Pop On, 3M ESPE) following the recommended sequence of finishing and polishing discs (coarse, medium, fine and superfine) so as to have standardized a smooth surface.

Cultivation of the Microorganism and Preparation of Cell Suspensions:-

A standard suspension of *S. mutans* (ATCC 25175) containing 10^6 cells/mL was prepared. For this purpose, *S. mutans* was seeded onto blood (Oxoid, UK) and incubated for 24 hours. All incubation was carried out at 37°C in a CO₂ chamber. After incubation, the growth was suspended in sterile physiological solution (0.9% sodium chloride (NaCl)), and the number of cells in suspension was counted in a spectrophotometer (B582, Micronal, São Paulo, Brazil). The parameters of optical density and wavelength used were, respectively, 0.620 and 398 nm. These parameters were previously established by means of a standard curve with CFU vs. absorbance.

Biofilm Adhesion:-

Adherence testing was performed in an aseptic environment in a laminar airflow chamber. The broth used for adherence was trypticase soya broth, dissolved in 1000 mL of distilled water. The broth was sterilized by autoclaving at 121°C for 15 minutes. In each well of Sterile 24-well polystyrene tissue culture plates was placed one specimen, 1.5 mL of broth, and 0.1 mL of standardized *S. mutans* suspension. The plates were sealed and incubated at 37°C for 24 hours in a CO₂ chamber. Samples were then removed and washed twice with sterile physiological solution (0.9% NaCl) in order to remove loosely bound material. Following this, the samples were placed in tubes with 3 mL of sterile physiological solution (0.9% NaCl) and sonicated (Sonoplus HD 2200, 50 W, Bandelin Electronic, Berlin, Germany) for 30 seconds to disperse the biofilms. The suspension obtained was diluted 10, 100, and 1000 times, and aliquots of 0.1 mL were seeded in duplicate onto BHI agar and incubated for 48 hours at 37°C in a CO₂ chamber. After the incubation, the plates with 30 to 300 typical colonies of *S. mutans* were counted in a colony counter (Phoenix CP-600, São Paulo, Brazil), and mean values of CFUs were obtained (CFU/mL). Mean values of CFU/mL were converted into logarithmic (log₁₀) values and analyzed by ANOVA and the Tukey test. p value, 0.05 was considered to indicate a statistically significant difference.

Scanning Electron Microscopy (SEM) Evaluation:-

All the specimens were subjected for SEM evaluation. One specimen of each subgroup was prepared for the SEM (JSM-5310LV JEOL, Tokyo, Japan) evaluation. The specimens were coated with silver in a vacuum evaporator. The "retained biofilms" on the specimens after sonication were observed for each group. The samples were rinsed with PBS buffer and fixed in 4% paraformaldehyde with 1% glutaraldehyde in PBS for one hour. The samples were rinsed with PBS three times for two minutes each, and finally rinsed with deionized water three times for two minutes each. They were then dehydrated through an ethanol series (50, 70, 80, 95, and 100%) for 15 minutes each, desiccated, sputter-coated, and observed by a SEM. Photographs of representative areas of the polished surface were taken at 3000× magnifications. The results were analyzed by calculating the mean and standard deviations for each group. The data of each material were subjected to analysis of variance (ANOVA) followed by Tukey's high significant difference (HSD) test at a p-value of 0.05

Results:-

Mean and standard deviation values of the CFU/mL (log₁₀) of *S. mutans* within the biofilms formed are displayed in Table 1. The one way ANOVA test revealed that there was significant difference in terms of the level of adhesion between the tested the four groups (P=0.01); the highest value of bacterial adhesion were recorded for Herculite classic followed by Z 250, Ceram X One and, finally SR NEXCO. There was no statistically significant difference between SR Nexco and Ceram X one and, there was no statistically significant difference between Z 250 and Herculite classic. However, there was statistically significant difference between SR Nexco and Ceram X one in one side and, Z 250 and Herculite classic in the other side (p 0.05). Table 1

Type of Material	Mean Adhesion Level (colonies/mm ²)	P value
SR NEXCO	4.6±0.09 ^B	0.001
Ceram X One	4.7±0.08 ^B	
Z 250	4.97±0.06 ^A	
Herculite classic	4.99±0.06 ^A	

Table 1:- Mean bacterial adhesion in different groups

Scanning Electron Microscopy (SEM) Evaluation:-

SEM showed that *S. mutans* was observed to be accumulated on the surface of Herculite classic and Z 250 much more than SR NEXCO and Ceram X One. Figure 1&2 and 3.

Figure 1:- showing SEM picture of *S mutans* on the surface of SR Nexco.

Figure 2:- showing SEM picture of *S mutans* on the surface of Ceram X One.

Figure 3:- showing SEM picture of *S. mutans* on the surface of Herculite classic.

Discussion:-

The quality and amount of adhered biofilm are important to the success of the esthetic restorations on a long-term basis. The initial adherence and subsequent colonization of bacteria on the surface of composite resins is the key of the pathogenesis of the secondary caries promoted particularly by *S. mutans* and *S. sobrinus*. *S. mutans* has been identified as the major etiological agent of human dental caries and composes a significant proportion of the oral streptococci in carious lesions.¹¹ *S. mutans* is harbored in mature plaque. Organic acids are trapped within the glucan barrier produced by these bacteria, resulting in a prolonged low pH around the enamel surface.¹²

Restorative materials may initiate plaque and secondary caries formation in the oral cavity. Therefore, it is important to observe for initial bacterial adhesion on restorative material surface, which is the first step in plaque formation. Initial bacterial adherence to solid surfaces is facilitated by several factors, namely electrostatic¹³⁻¹⁵ and hydrodynamic interactions¹⁶, thermodynamic binding parameters¹⁷, specific binding mechanisms including adhesion receptor interactions by which bacteria bind selectively to the surface, and cementation by polysaccharide matrices or glucans.^{5,17-19}

Although polyester matrix strips promote the smoothest surface most clinical situations require bulk removal of excess composite. Additionally, finishing and polishing techniques are necessary to remove the monomer rich surface layer of the composite material.²⁰ This eventually eliminates the organic matrix, exposing and dislodging the filler particles, thus increasing the surface roughness of polymer-based materials.¹⁶ Among finishing and polishing techniques, it has been reported that the Sof-LexTM aluminum oxide, discs technique provides a smoother surface on composites compared to carbide bur finishing followed by the Astrobrush TM technique.²¹

For this investigation, the samples were not coated with saliva because previous studies^{22,23} have found that saliva coating did not significantly alter the adhesion patterns of *S. mutans* and *S. sobrinus*. This phenomenon is consistent with other investigations showing that saliva coating does not significantly alter the adhesion of Streptococci to the underlying materials.^{24,25} However, other authors suggest emulating the conditions of the oral cavity, such as temperature, constant movement and saliva coating, which could represent an environment closer to reality.^{26,27}

In the present study it was found that SR Nexco and Ceram X one have the lowest bacterial adhesion with no significant difference between them and significant difference with the other two resin composite which may be in SR Nexco due to the enhanced polymerization of all resin composite by the furnace enhanced polymerization with

no or fewer double bond with subsequent enhancement of the surface characteristics minimizing bacterial adhesion which is in agreement with Derchi G who found that Indirect dental restorative composite resins less prone to biofilm adhesion than direct composite resins.²⁸, while in Ceram X one the lower bacterial adhesion may be due to the nano-ceramic filler used in its construction giving it a higher filler loading and smoother surface which yields a smoother surface with subsequent lower adhesion of bacteria, and this in agreement with the study conducted by

Ionescu A who concluded that the proportions of resin matrix and filler particles on the surface of resin-based composites strongly influence *S. mutans* biofilm formation in vitro, suggesting that minimization of resin matrix exposure might be useful to reduce biofilm formation on the surface of resin-based composites.²⁹

Both Z250 and Herculite classic have nearly the same tendency for bacterial adhesion also Z250 used as indirect resin composite it was cured by the direct LED without any furnace which may yield degree of conversion similar to that of Herculite, also they have similar filler size so under the same finishing and polishing procedure they gave nearly equal surface characters which explains the similarity in bacterial adhesion and this in accordance with Celik C et al who studied the effect of finishing and polishing procedures on surface roughness of tooth-colored materials and found that the smoothest surface was generated with Sof-Lex Pop-on disks for all the materials tested.³⁰

The surface micromorphology of resin composites after finishing and polishing has been shown to be influenced by the size, hardness, and amount of filler particles. Harder filler particles are left protruding from the surface during polishing, as the softer resin matrix is preferentially removed in hybrid composites. Filler particles should be situated as close together as possible in order to protect the resin matrix from abrasives.³¹ A nanocluster filler particle consists of loosely bound agglomerates of nano-sized filler particles. Eventually, the surface has smaller defects and better polish retention.³² Filtek Z250 showed the least surface smoothness compared with Ceram X and **SR NEXCO** composite restorative materials, probably because it contains large glass filler particles which can be plucked away, leaving voids or rougher surface after being polished.^{31,33} For these responses the *S. mutans* less attached to **SR NEXCO** and Ceram X than Filtek Z250 and **Herculite classic**.

Under the limitation of this study it was concluded that SR Nexco is a good choice for clinical situation that requires indirect esthetic restoration in regard to bacterial adhesion. Ceram X one is a good choice for clinical situation that requires direct esthetic restoration in regard to bacterial adhesion.

Chronic Kidney Disease/ Inspiratory
 Muscle Training/ Diaphragmatic
 Excursion.

Abstract

Background: Hemodialysis patients suffer from severe muscular weakness and one of the most important muscle is the diaphragm – main muscle of respiration – that was experienced by dyspnea and decreased functional capacity due to a unique form of protein and energy malnutrition. **Purpose:** to determine the response of diaphragmatic excursion to inspiratory muscle trainer prior hemodialysis session. **Methods:** Thirty patients of both sexes (10 men and 20 women) were included in this study with mean age (\pm SD) was 35.47 (\pm 6.51). They were chosen from El Sahel Teaching Hospital, Nephrology department, dialysis unit, and undergoing dialysis from at least 2-3 years. Ultrasonography (U.S) was used to assess diaphragmatic excursion (D.E) during deep breathing maneuver before and at the end of the training program. All patients received the inspiratory muscle training for 12 weeks, 3 times/week. **Results:** The results of this study showed statistical significant difference between pre and post-training in diaphragmatic excursion ($p < 0.001$) with a percentage of improvement 65.74%. The percentage of improvement in men was 65.29% corresponds that in women was 66.08% compared to the pre-data status. **Conclusion:** Inspiratory muscle training by inspiratory muscle trainer device for 12 weeks in hemodialysis patients had significantly improved the diaphragmatic excursion (DE) that ensures the improvement in their mechanics of breathing and sense of dyspnea.

Introduction:-

Chronic kidney disease is an evolving problem in modern countries. In 2010, 520,000 patients had routine dialysis. Each year, new patients (4.1%) are added to dialysis patients. Although hemodialysis has increased life expectancy of these patients, they suffer from many complications including restricted physical activity, muscle weakness, anemia, osteoporosis and metabolic disturbances. Muscle weakness is manifested as generalized weakness and particularly respiratory muscle weakness manifested by reduced vital capacity.¹

Several decades of research efforts devoted to studying the patterns of chronic kidney disease-end stage renal disease (CKD-ESRD) progression as well as the impact of acute kidney injury (AKI) on this continuum of CKD-ESRD evolution but the full understanding of the process (es) of CKD-ESRD progression remains elusive². Significant muscle weakness and associated atrophy is seen in both dialysis patients and in patients with chronic kidney disease (CKD) stages 3–4. This is associated with increased morbidity and mortality^{3,4}.

Maintenance dialysis patients encounter multiple catabolic processes and experience a unique form of protein and energy malnutrition, which is characterized by muscle wasting and decreased visceral protein stores. The pathophysiology of muscle wasting in chronic kidney disease clearly is complex, multifactorial, and not fully elucidated. What is clear is that abnormalities in muscle function, exercise performance, and physical activity begin in earlier stages of chronic kidney disease and progressively worsen as ESRD ensues⁵.

The diaphragm is the major respiratory muscle, contributing up to 70% to resting lung ventilation. During dialysis the diaphragm as a skeletal muscle is affected by protein breakdown leading to its weakness and limitation of its movement⁶. These muscles show decreased in muscle strength and endurance properties resulting from uremic myopathy. Some authors who have studied the involvement of uremia in the diaphragm have concluded that loss of strength occurs through severe uremia. The ventilatory deficit due to this impairment in respiratory muscles, combined with other lung tissue impairments, compromises the functioning of this system, thereby contributing towards decreased lung capacity⁷.

The relationships between the lungs and the kidneys are clinically important ones in both health and disease. Chronic renal failure may affect respiratory function. Pulmonary dysfunction may be the direct consequence of circulating uremic toxins or may result indirectly from volume overload, anemia, immune suppression, extra osseous calcification, malnutrition, electrolyte disorders, and/or acid–base imbalances⁸.

As the respiratory muscles are morphologically and functionally skeletal muscles and therefore respond to training, just as any muscle of the locomotor system⁹. Inspiratory muscle training (IMT) is a technique used to increase strength or endurance of the diaphragm and accessory muscles of inspiration which improve inspiratory muscle functions, lung volumes, work capacity and power output¹⁰.

Methods:-

Participants:-

Thirty patients of both sexes (10 men & 20 women) undergoing hemodialysis from at least 2-3 years selected from El Sahel teaching hospital nephrology department, Dialysis unit with mean age (\pm SD) was 35.47 (\pm 6.51). They performed the dialysis 3 times / week. The purpose, nature and potential risk of the study were explained to all patients. All patients signed a consent form prior to participation in the study and confidentiality was assured. The inclusion criteria in the studied group were patients with creatinine level ranged from 4.8-7.8mg/dl and didn't participate in any physical activity prior the study by at least 6 months. Patients had the following criteria were excluded from the study: recent lung surgery (within 12 months), un-drained pneumothorax or large bullae on chest radiograph, marked osteoporosis (t-score $>$ -1.5) with a spontaneous rib fracture and developing cancer or smoking patients.

Protocol:-

All enrolled patients were evaluated by M-mode Ultrasonography to assess maximum diaphragmatic excursion pre and post-training by the same (U/S) machine and examined by the same U/S skilled radiologist. Diaphragmatic excursion (DE) were measured using a real time sonographic system with a 3.8 MHz convex probe (Aloka prosound 4000, Aloka, Japan ultrasound machine) at a depth of 22-24 Cm. The distance difference between the same leading edge of the diaphragm at the end expiration and end inspiration is calculated by M-mode tracing. During inspiration the diaphragm moves caudally towards the U/S probe and is represented by the upper peak on the M-mode, and during expiration the reverse occurs with the lower peak on M-mode represents the expiration. The difference between the peaks on M-mode is calculated by the machine and it represents the diaphragmatic movement (excursion) in the respiratory cycle that was ranged between 1.7- 2.5 cm.

Training Procedures:-

All patients in this study received the following instructions: Patients were instructed to wear loose, comfortable clothing especially around neck; they were rested in a sitting position. The training started by setting the maximum

load in which the patient could successfully execute ten breaths at maximum resistance depending on the patients' rate of perceived exertion, the starting load equal to 30% of the patient's maximum inspiratory effort. This individualized load increase progressively as the inspiratory muscle became stronger. The recommended pressure load determined by the 30% maximum 10-repetition method by using IMTdevice¹¹. The mouthpiece was attached to the device and nose clip on the patient's nose; so that all of the breathing was done through the mouth making sure the lips were sealed around the mouthpiece and the tongue not occlude it. The patients were asked to take full breath in (maximal and deep inspiration) then longer and slow expiration through mouthpiece. Continue this breathing pattern for 10-20 breath. Repeat this pattern for 4-6, 4-6 times, or about 10-15 minutes with rest in between 30 second. The session was repeated three times/week once daily for 12 weeks. The time of the session was at the morning prior to the dialysis session.

Results:-

Data obtained prior and following management including diaphragmatic excursion was statistically analyzed by SpSS. 20 computer statistical package.

Demographic data:-

Thirty patients (10 men & 20 Women) age ranged from 26 to 45 years old with mean age (\pm SD) was 35.47 (\pm 6.51), their height ranged from 1.56 to 1.8m with mean height 1.68(\pm 0.06), their weight ranged from 65 to 85 kg with mean weight 72.4(\pm 5.02) and their BMI ranged from 21.95 to 27.9 kg/ m² with mean BMI 25.63(\pm 1.46).

Studied parameters assessment:-

Table (1):- Statistical Analysis of Diaphragmatic Excursion measured pre- and post-training for the patients.

	Range	Mean \pm SD	Mean difference	Percentage of improvement	t-value	P value
Pre-training	1.70-2.50	2.16 \pm 0.25	-1.42	\uparrow 65.74%	-61.856	0.001**
Post-training	3.00-4.00	3.58 \pm 0.34				

**p< 0.01= highly significant.

Statistical analysis showed that increased significant improvement in diaphragmatic excursion that was shown in the mean difference (-1.42) with a percentage of improvement of 65.74% when compared to the pre- measured data that was shown in table (1) & figures (1&2).

Fig.(1) :- Diaphragmatic Excursion of the Studied Group

Fig.(2) :- Percent of improvement throughout the study

Table (2) :- Statistical Analysis of diaphragmatic excursion for men & women throughout the study:-

	Men (n=10)		Women (n=20)		MD	t-Value	P-value
	Pre	Post	Pre	Post			
Range	1.7-2.1	3-3.35	2-2.5	3.5-4			
mean \pm SD	1.93\pm0.16	3.19\pm0.13	2.27\pm0.22	3.77\pm0.21			
MD	-1.26		1.50		-0.24	11.343	0.001**
% of improvement	\uparrow 65.29		\uparrow 66.08				
t-Value	-61.688		-62.761				
P-value	0.001**		0.001**				

MD: mean difference .

**p< 0.01= highly significant.

As shown in table (2) & figures (3 &4) there was a significant difference between the pre and post-training results in men by 65.29% and in women by 66.08% that gives the resultant difference that women achieved a greater improvement than men did .

Fig.(3) : Diaphragmatic Excursion mean values pre- and post-training for men and women subgroups.

Fig.(4): The percentage of improvement represented in men and women.

Discussion:-

The analysis of the results of the current study showed that diaphragmatic excursion in hemodialysis patients that received inspiratory muscle training prior the session was significantly improved with percentage of 65.74% .This improvement in the diaphragmatic excursion may be due to improvement of diaphragm mechanics, power and inspiratory muscle strength. Studies involved the problem of strengthening of the diaphragm in hemodialysis patients is of great shortage.

The results of this study coincided with the results achieved by **Saad, 2013**¹² who **concluded** that inspiratory muscle training by IMT device for one month in post liver transplantation patients significantly improved the diaphragmatic excursion of these patients in addition to improvement of breathing mechanics for the study group.

The results of this study also agreed with the results achieved by **Saafan, 2013**¹³ who concluded that the inspiratory muscle training had significantly improved the diaphragmatic strength after upper abdominal surgeries.

A study results achieved by **Hamad , 2012**¹⁴ came in accordance with this study who concluded that inspiratory muscle training by IMT device for one month in postoperative thoracotomy patients significantly improved the diaphragmatic excursion of these patients in addition to improvement of breathing mechanics .

It was found that six weeks of post operative inspiratory muscle training using threshold IMT device significantly improved the ventilatory function and shortened the duration of postoperative hospitalization in patients gone through thoracic surgery¹⁵. This may be attributed to an improvement in the diaphragm strength, as evidenced by improvement in respiratory mechanics that led to better expansion of the chest which reflected as increase in the ventilatory function leading to early recovery of respiratory function impairment which consequently shortened the duration of postoperative hospitalization¹⁶.

Also the results of this study coincided with the results achieved by **Edwards and Cooke,2008**¹⁷ who concluded that the inspiratory muscle training device had a significant effect on maximum inspiratory pressure in patients underwent pulmonary lobectomy.

In agreement with the results of the current study **Hart et al., 2006**¹⁸ found that significant improvement in inspiratory muscle function and diaphragmatic excursion which were also associated with improved psychosocial status were noticed after eight weeks of high intensity IMT in patients with cystic fibrosis which suggested that increasing inspiratory muscle function may have significant long-term health implications for patients with respiratory disability.

The results of this study coincided with the results of trials with IMT. The finding revealed that IMT intervention improves exercise capacity and quality of life, particularly in patients with inspiratory muscle weakness. Some benefit from IMT may be accounted for by the attenuation of the inspiratory muscle metabolic reflex. Moreover, IMT results in improved cardiovascular responses to exercise and to those obtained with standard aerobic training¹⁹.

In agreement with the results of the current study **Ysayama et al., 2008²⁰** showed that IMT for 4 weeks before esophagectomy resulted in a significant increase of respiratory muscle strength and endurance.

In contrast **Mc Gill and Brown 2011²¹** reported a non-significant change in diaphragmatic excursion (DE) with inspiratory muscle training program for 4 weeks and might be explained by short duration of the study.

Moreover, the results of this study shows that the percentage of improvement of diaphragmatic excursion in women is better than in men as women percentage of improvement is 66.08% and men percentage of improvement is 65.29% although the excursion is more stronger in men as their rhythm of respiration is abdominothoracic while the rhythm of respiration in women is thoracoabdominal that may be attributed to the fact of reduction of the inspiratory muscles strength with age in men 25+ & women 35+ and that must be taken into consideration the presence of weakness already with hemodialysis. With IMT women with their smaller size of the lung experienced much better benefit of the mechanics of respiration.

Conclusion:-

Inspiratory muscle training by IMT device is an effective rehabilitation method that improves diaphragmatic excursion (DE), sense of breathlessness and functional capacity in hemodialysis patients.

Abstract

The study sought to determine the status and indicators of teachers' ICT competency and National Achievement Test performance of pupils; relationship between the teachers' demographic profile and teachers' ICT competency, schools' ICT program and ICT infrastructure. The descriptive correlation survey was adopted and 1,012 teachers from 9 districts in the Division of Laguna were given questionnaire. The statements on competencies were based from the 4 domains of National ICT Competency Standards for Teachers which are social and ethical, technology and operation concepts, pedagogical, and professional domains. The findings revealed that competence on social and ethical, technology and operation concepts, pedagogical and professional domains obtained means were interpreted at basic level. In terms of NAT performance of 42 schools, 17 are big schools and 25 are small schools, only 4 schools obtained Moving-Towards-Mastery (MTM). The status of School's ICT program in selected clusters in terms of Teachers' ICT competence and Curriculum Integration with mean scores of 2.10, and ICT Infrastructure mean of 1.64, with an overall mean of 2.02 was interpreted at Progressing level. The relationship between the teachers' demographic profiles and teachers' ICT competency was found significant, however no significant associations were found between schools' ICT program and ICT infrastructure. All indicators of ICT competency skills of teacher respondents were not significant and did not affect significantly the NAT performance. The school administrators need to provide in-service trainings on ICT, improve schools' ICT facilities to enhance teachers' ICT competency skills and increase level of ICT integration to instruction.

of Education (DepEd), e-learning and the use and application of ICT must be employed in all subjects because this is now the most viable intervention in educational reform.

DepEd is giving its best to make Computerization Program one of the most functional, if not the greatest program, being implemented at present. The times call for education to aim towards advancement of technology. This can only happen with the installation and use of computers and other equipment which call forth for modern technology and advance learning.

The Human Development Report of the United Nations Development Program or UNDP (2001) states, "ICT is a pervasive input to almost all human activities. It breaks barriers to human development in at least three ways: by breaking barriers to knowledge, by breaking barriers to participation and by breaking barriers to economic opportunity." Even in the daily lives of teachers and school heads, the rapid advances in ICT can create new things such as storing information, retrieving information, handling, distributing and utilizing information. The advancement of ICT according to Ocampo (2002)⁹ is intertwined with globalization and together creates a new paradigm called the network age.

Despite the efforts of DepEd, various studies conducted on limited samples of teachers reflect alarmingly low levels of teacher competency. For instance, a study in 2004 revealed that only 1 out of 7 schools had teachers who were computer literate (Java, 2004)⁶. Two years back, a study found out that seventy-five percent of respondent schools had only 10 percent of their teachers with Internet skills (Tinio, 2002)¹⁰. These studies reveal a nuance that the teachers are deficient in ICT skills. This necessitates the conduct of a definitive study which seeks to measure the ICT competencies of Filipino teachers.

There is a growing challenge in the Philippines in the appropriate and efficient use of ICT in teaching and learning. With the multitudes of programs launched by both private and public sectors there are questions of what happened, present status, and where the program is heading. The resources poured into ICT in the supply of equipment, access to software, and availability of telecommunication infrastructures, capacity building for teachers, among others have reported to have been made in collaboration with the private sectors specifically Microsoft, Intel, and major telecommunications companies, organizations, and other governments with DepEd. (DBM, 2009).

It is imperative to examine the situation of learners and how information and communication tools help them prepare for the real life. This study aimed to analyze the different domains, causes of problems, and relationships that have bearing to the teaching and learning process. Hence, a research entitled Status of Information and Communication Technology Program and National Achievement Test Performance of Public Schools in the Division of Laguna, Philippines was conceived

Research Methods:-

Sampling Technique. This study was conducted in the Schools Division of Laguna, Philippines. It is composed of 2 selected clusters which are Cluster 2 and 3 with 9 selected districts with 42 selected elementary schools. Specifically, the 9 districts are Los Banos, Victoria, Bay, Magdalena-Majayjay, Cabuyao, Calauan, Alaminos and Cavinti Districts, all are located in the province of Laguna. Primarily, this study relied on the result of the quantitative data gathered. Thus, more number of schools were needed. Since the source of data is mainly quantitative, a large number of respondents were imperative. Purposive random sampling was done in the selection of schools. Central (big school) and non-central (small school) schools from each district were taken as samples. It was purposely chosen to make the findings generalizable to the population where schools from different categories are well-represented. Central and non-central schools were involved in this study to include instances chosen deliberately to reflect diversity on presumptively important dimensions from schools with varied predictors. Schools were not chosen randomly but rather purposively and conveniently.

Respondents of the Study. The 1,012 public elementary school teachers were selected from clustered 9 districts in the Division of Laguna. The teachers were taken as the primary respondents because they are the front liners in attaining Quality Education through the use of ICT in their teaching-learning process.

Research Instrument. The survey questionnaire for elementary school teachers on perceived ICT competencies and school's ICT program was used as the main instrument of the study. It was developed, validated and mainly utilized to answer the research questions and to find out the perceived competencies, extent of use and training needs on ICT

of public school teachers in selected districts in Division of Laguna. Their ICT competencies were measured using the questionnaire and the results of the survey contributed as bases in the National Achievement Test Performance of grade 6 pupils and to equip elementary school teachers with knowledge and skills on ICT as an appropriate tool in the teaching-learning process. Part I of the research questionnaire is the respondents' demographic profile. The questionnaire was patterned to several instruments. Part of which described the respondents' background information that includes; age, gender, civil status, family monthly income, highest educational attainment, length of service, position and number of ICT related trainings. Part II of the research questionnaire comprised of statements on competencies based on the 4 Domains of National ICT Competency Standards for Teachers (NICS for Teachers) which are the social and ethical, technology and operation concepts, pedagogical, and professional domains. The said domains and standards were customized to fit in the study. Schools' ICT inventory and checklist were also included to determine the status of schools' ICT program in the Division of Laguna. To gauge the capacity/capability of the Schools Division in terms of emerging, progressing, and advance, the researchers personally interviewed and gave the Division Planning Officer a questionnaire who is in charge of the physical facilities of the whole division. The questionnaire was validated by 3 experts from DepED Division of Laguna. After validating the questionnaire, it was pilot tested with 9 principals, 5 from central schools and 4 from non-central schools to ensure the reliability, validity and accuracy of the research instrument. It set an accepted level of proficiency by portraying demonstrable activities. These standards were concretized by specific indicators for the implemented questionnaire. These were measured by a Likert scale type of instrument where 1 shows a weak grasp of the indicator and 4 is the highest, showing high proficiency. The responses of the respondents were tabulated and analyzed using the Statistical Software (SPSS). The researcher used descriptive statistical technique to calculate the frequencies, percentage distribution and means and standard deviation of each response to present the details about the teacher profile, ICT competency of the teachers. Independent Sample's T-Test, Pearson, Regression were done to check the significant relationship between perceptions of the respondents in ICT competencies and school's ICT program.

Research Procedure. The researchers sought the permission of the Schools Division Superintendent, district supervisors and school heads of the Division of Laguna. Before the distribution of the questionnaires, the researchers met the administrators and explained to them the purpose of the study. Distribution of the questionnaires to the administrators and their teachers followed. The researchers then administered the questionnaires personally from one school to another in the identified public elementary schools. Documents from the Districts and Schools' Planning Offices were also analyzed to determine the status of schools' ICT program from school years 2011-2014. To answer the research problems, the instrument on ICT competencies, schools' ICT program, and NAT Performance of grade 6 were used. The weighted mean and qualitative descriptions were utilized to determine the ICT competencies and ICT capabilities of schools in the division of Laguna. Upon the retrieval of questionnaires, data from elementary school teacher-respondents were quantified. Data analysis and findings of this study hinge primarily upon the results of quantitative data gathered from the surveys. The quantitative data were analyzed using the mean, standard deviation, percentages and frequencies to find out the profile of elementary school teachers as to age, gender, civil status, family monthly income, highest educational attainment, length of service, position and number of ICT related trainings. Mean and SD were used in computing the perceived ICT competencies, and ICT program of schools.

Results and Discussion:-

Figure 1 shows that a small scale of the respondents are male, from 1,012 respondents only 103 are male or 10.2%, while the female comprised 89.8% with a total of 909 or 89.8%.

Figure 1:- Distribution of Gender of Teacher-Respondents

As presented in Figure 2, majority are married, comprising of 72.7% or 736, 21.8% are single, 4.3% are widow, and 1.1% or 11 are separated out of 1,012 teacher-respondents.

Figure 2:- Distribution of Civil Status of teacher-respondents

As revealed in Figure 3, among the 1,012 respondents, 558 or 55.1% are in the service for 10 years, while 28.4% or 287, 29 or 2.8% are in their 31 to 40 years in service and 1 is in the service for 40 years or more.

Figure 3:- Length of Service of the teacher-respondents

Table 1:- Level of Mean Perception of Respondents on ICT CompetencySkills

ICT COMPETENCY SKILLS	MEAN	SD	DESCRIPTIVE INTERPRETATION
SOCIAL AND ETHICAL	2.53	0.60	PROFICIENT
TECHNOLOGY AND OPERATION CONCEPTS	2.41	0.76	BASIC
PEDAGOGICAL	2.14	0.75	BASIC
PROFESSIONAL	2.2	0.72	BASIC
OVERALL	2.32	0.71	BASIC

Legend: 1.00-1.50-Below Basic, 1.51-2.50-Basic, 2.51-3.50-Proficient, 3.51-4.00-Highly Proficient

The respondents' ICT competence on social and ethical with a mean of 2.53 and interpreted as proficient, while technology and operation concepts, pedagogical and professional domains scored 2.41, 2.14 and 2.2, respectively were described as basic. The findings confirmed with the study of Kim and Baylor (2008)⁷ that the use of technology for teaching requires the development not only of knowledge, skills, and behaviors but also of appropriate attitude, social, and ethical foundation. Chang (2012)² posits that to be an experienced and capable technological leader, school administrators such as the principal, must be trained in vision, planning and management, how school reform will be affected by technology and ICT tools and infrastructure support, evaluation and research. Further, according from the study of

Table 2 shows that among 42 schools, only 4 schools have reached Moving-Towards-Mastery (MTM) in the NAT. The school with highest mean percentage score was obtained by C5 S4 (small school) with an MPS of 75.82; followed by C5 S3 (small school) with 69.05 mean percentage score and C5 B2 (big school) with 67.74, and C6 S1 (small school) with 66.29 mean percentages scores, respectively.

Table 2:- Mean Percentage Scores of National Achievement Test of Grade 6 in Selected Clustered Districts and Schools

Clustered Districts and Schools	NAT VI Mean Percentage Scores (MPS)	Mastery Level Descriptive Equivalent

Mastery Level Descriptive Equivalent: 0%-4% Absolutely No Mastery (ANM), 5%-14% Very Low (VL), 15%-34% Low (L), 35%-65% Average (AVR), 66%-85% Moving Towards Mastery (MTM), 86%-95% Closely Approximating Mastery (CAM), 96%-100% Mastered (M)

With reference to the study of ELNORD(2006)⁴, ICT generally has a positive impact on learning but the expectations that ICT could in some ways revolutionize processes at school have not been realized. This goes beyond the use of computers by teachers since not only personal computers (PCs) and the Internet but also digital

cameras, mobile phones and other technologies can help to change teaching processes. The use of ICT is mostly focused on supporting the subject content, hence ICT-based activities by pupils are more time consuming than producing output. Moreover, the impact of integrating ICT in teaching can be measured in pupil engagement, differentiation, creativity and by the fact that less time is wasted, though the impact of ICT is very dependent on how it is used. Headmasters typically view ICT as a valuable tool for pedagogical development but very few of them actually experience this impact

Table 3:- Status of Schools' ICT Program

Components of Schools' ICT Program	SD	Mean	Descriptive Interpretation
Teachers' ICT Competence	0.66	2.10	Progressing
ICT Infrastructures	0.48	1.64	Progressing
Curriculum Integration	0.69	2.10	Progressing
Overall	0.49	2.02	Progressing

Legend: 1.00-1.50-Emerging 1.51-2.50-Progressing 2.51-3.00-Advanced

Table 3 reveals that the status of Schools' ICT Program in selected clusters are progressing in terms of Teachers' ICT Competence and Curriculum Integration with a mean of 2.10 and ICT Infrastructure with 1.64 mean score. Kozma (2008)⁸ acknowledges that ICT strategies in many countries cut across diverse fields. Infrastructure development is necessary in order to ensure access to schools, networks and resources for learning. Teacher training both initial and in-service is a prerequisite for the ability of education to use ICT in learning processes. Curricula and pedagogical approaches may have to be changed in order to cater for educational change with ICT.

Table 4 revealed significant associations between ICT School Program (in terms of teachers competence) and ICT Competency skills in social and ethical, and technology and operation concepts with p-value of less than 0.05. A study conducted by Ministry of Education of Norway (2006) states that the extent of teachers' education has implemented courses and strategies towards the increased competence of teachers in using ICT which is an important part of educational development and change. This could be seen as ICT literacy indicators for teacher education, and of how teachers are prepared to face the challenges in their practice as teachers.

Table 4:- Relationship between the Respondents' Perceptions on ICT Competency Skills and Schools' ICT Program in terms of Teachers' Competence

ICT Competency Skills	Correlation Coefficient	p-value
1 Social and Ethical	0.316	0.041*
2 Technology and Operations	0.293	0.059
3 Pedagogy	0.137	0.387
4 Professional	0.216	0.170

Table 5 shows that significant associations were not found between ICT School Program (in terms of Schools' ICT Program) and all Respondents' Perception ICT Competency Skills (p value is more than 0.05).

Table 5:- Relationship between the Respondents' Perception on the ICT Competency Skills and Overall Schools' ICT Program

ICT Competency Skills	Correlation Coefficient	p-value
1. Social and Ethical	0.227	0.149
2. Technology and Operations	0.249	0.111
3. Pedagogy	0.060	0.707
4. Professional	0.112	0.479

In accordance to the study of Baylor and Ritchie (2002)¹, which states that it is useful for school leaders as it underlines the importance of having a shared vision on the place of ICT in education and having a school based ICT policy plan. Such a plan acts as a blueprint for the sequence of goals a school hopes to achieve. It also outlines the overall philosophy of technology use and indicates how ICT will improve teaching and learning.

Table 6:- Relationship between Schools' ICT Program and NAT Performance

Schools' ICT Program	p-value
1. Teachers' Competence	0.466
2. Facilities and Infrastructure	0.426
3. Curriculum Integration	0.203

As could be gleaned in Table 6 , the Schools' ICT components were not significant and does not affect significantly the NAT performance. According to Honey (2005)⁵, efforts to integrate technology into schools and classroom practices must not only be acknowledged but also provide evidence that technology assists in meeting these accountability demands. School systems must prove the investments made in technology are improving student scores on standardized tests.

Conclusions:-

The respondents' ICT competence on social and ethical was described as Proficient, while technology and operation concepts, pedagogical and professional domains were described as Basic. It is therefore imperative that teachers need to be supported with ICT infrastructure for simulation and blended learning. Since only 4 schools have reached Moving-Towards-Mastery (MTM) level in the National Achievement Test, ICT integration in the basic education curriculum in all learning areas, to wit Mathematics, English, Science, Filipino and Social Studies is recommended. The interactive approaches in the learning process will enhance the performance of pupils in the standardized test administered by the Department of Education. The status of Schools' ICT Program in selected clusters are progressing in terms of Teachers' ICT Competence and Curriculum Integration. Significant associations were not found between ICT School Program (in terms of Schools' ICT Program) and all Respondents' Perception ICT Competency Skills. The Schools' ICT components were not significant and does not affect significantly the NAT performance. The school administrators need to provide in-service trainings on ICT, improve schools' ICT facilities to enhance teachers' ICT competency skills and increase level of ICT integration to instruction.

Key words:-

Laser, black gingiva, racial pigmentation, gingival hyperpigmentation, systematic review.

Abstract

Background: Being a science of beauty, beautiful smile is an integral part of contemporary dental practice. Gingival hyperpigmentation is considered an esthetic problem that needs a patient centered management. Dental operators are attracted to laser benefits not only during surgery but also for postoperative status. This review aimed to assess laser use in esthetic removal of gingival hyperpigmentation in comparison to conventional methods.

Materials and Methods: An electronic database search on PubMed and Cochrane library without date restriction was done and clinical studies in which laser was used for esthetic gingival depigmentation were selected and evaluated. Out of the initial search that yielded 183 studies, 21 were considered potentially relevant for the present review, out of which only 4 were finally selected. They studied the effect of laser on depigmentation, chair time, bleeding index, patient satisfaction and repigmentation.

Results: The analysis of the results shows that the assessed studies are too limited in number beside exhibiting small sample sizes. They are clinically heterogeneous so that a solid evidence based conclusion cannot be reached.

Conclusion: Researchers should be attracted to this research gap. Randomized clinical trials with a larger sample size, different laser parameters and longer follow up are strongly recommended.

Introduction:-

Being a science of beauty, beautiful smile is an integral part of contemporary dental practice. Good smile involves not only teeth shape and color but also the gingival status. Pink gingival color is more favorable than dark one. Melanin hyperpigmentation or darker gingival color can be considered an aesthetic concern rather than a medical problem (Basha *et al.* 2015).

Dentists should be prepared with the latest evidence based practice for management of such cases. The selection of technique should be based not only on clinical experience and doctor preferences but also on patient preferences (Thangavelu *et al.* 2012). Various methods can be used with varied degrees of success (Roshna and Nandakumar 2005)

Gingival hyperpigmentation can be defined as a darker gingival color beyond what is normally expected. The most common cause is racial pigmentation while other causes includes physiologic and/or pathologic factors (Dummett and Barens 1967). Gingival depigmentation is the treatment aiming to remove the melanin hyperpigmentation and it can be done by several techniques including mechanical, surgical, electrosurgical, cryosurgical, free gingival grafts, and lasers (Cicek and Ertas 2003, Hegde *et al.* 2013, Chandna and Kedige 2015). Surgical stripping was the old gold standard but now lasers have gained importance in the past years (Hegde *et al.* 2013, Basha *et al.* 2015).

A critical concern in the management of hyperpigmented gingiva is relapse or gingival repigmentation which can be defined as the reappearance of pigmentation after a period of no clinically hyperpigmentation. Recurrence usually varies according to the used methodology and the length of follow-up (Hegde *et al.* 2013).

The clinical rationale for comparing laser to conventional methods can be simply based upon the need for minimally invasive techniques for achieving a patient relevant outcomes (Ribeiro *et al.* 2014).

Based on this background, the aim of the present systematic review is to evaluate and compare the effects of conventional techniques versus lasers for gingival depigmentation as regards to removal of pigmentation, patient preference and time taken for repigmentation.

Materials and Methods:-

Protocol:-

The methods as well as inclusion/exclusion criteria used in the present study were determined in advance. The current systematic review was performed following the PRISMA guidelines for identification, screening, eligibility, and inclusion (Moher *et al.* 2010). The following focus question was developed: In patient requiring esthetic removal of gingival hyperpigmentation, is laser use recommended over conventional techniques, what is the evidence based recommendation for both patients and operators?

Information Sources:-

The electronic search was performed in two databases, MEDLINE (PubMed) and Cochrane library databases for articles with no date restrictions.

Search:-

The researched keywords were: (Black OR pigment OR melanin OR pigmentation OR hyperpigmentation OR pigmented OR dark OR Pigmentary OR pigmentations OR melanin) AND (Lased OR laser OR LLLT) AND (Gingiva OR mucosa OR gingival OR mucosal OR gum).

Selection of studies:-

Titles and abstracts resulted from the search were screened by authors considering the inclusion criteria. Authors decisions about choices and their qualification for further analysis was affirmed after discussion.

Inclusion and exclusion criteria:-

Inclusion criteria:-

- Randomized Clinical trials only
- Laser compared to conventional methods

Exclusion criteria:-

- Pigmentation due to amalgam tattoo, nevus or syndromes
- Case reports
- In vitro and animal studies
- Languages other than English

Assessment of methodological quality:-

The quality of all chosen randomized trials was investigated utilizing The Cochrane Collaboration's tool for evaluating risk of bias (Higgins *et al.* 2011).

According to Cochrane risk of bias tools, each RCT was assigned either; low risk of bias (if it is low for all key domains), high risk of bias (if it is high for one or more of key domains) and unclear risk of bias (if it is unclear for one or more of key domains). Because it was impossible to blind participants or personnel due to nature of intervention and control (i.e. Laser VS surgery), the “BLINDING OF PARTICIPANTS, PERSONNEL” item was not considered.

Results:-

Out of the initial search that yielded 183 studies, 21 were considered potentially relevant for the present study, out of which 4 were finally selected. Figure (1) represents the flow chart for the study. The excluded studies before final inclusion were uncontrolled or without conventional control (Trelles *et al.* 1993, Hanada *et al.* 1996, Nakamura *et al.* 1999, Ozbayrak *et al.* 2000, Tal *et al.* 2003, Esen *et al.* 2004, Azzeh 2007, Kaya *et al.* 2012, Giannelli *et al.* 2014, Kishore *et al.* 2014, Soliman *et al.* 2014, El Shenawy *et al.* 2015), review article (Karydis *et al.* 2011), uncontrolled case reports (Rosa *et al.* 2007, Bin Cho *et al.* 2010), non-randomized trial (Grover *et al.* 2014) and the study of Giannelli *et al.* which was a thermographic and fluorescent study for optimizing gingival laser photoablation (Giannelli *et al.* 2013).

The final included studies were four (Hegde *et al.* 2013, Ribeiro *et al.* 2014, Basha *et al.* 2015, Chandna and Kedige 2015). The heterogeneity between trials prevented meta-analysis. Rather, a descriptive analysis of the reported studies was performed. Table (1) represents summary of findings.

Risk of bias within studies:-

The review included 4 studies, 3 studies (Hegde *et al.* 2013, Ribeiro *et al.* 2014, Basha *et al.* 2015) used split mouth study design and 1 study (Chandna and Kedige 2015) used parallel design. Sex distribution was mentioned in 3 studies (Hegde *et al.* 2013, Ribeiro *et al.* 2014, Chandna and Kedige 2015) and not mentioned in 1 study (Basha *et al.* 2015).

For RCT studies, according to Cochrane Risk of Bias Tool, all studies were judged as low risk of bias for incomplete outcome data, selective reporting and other bias. Regarding random sequence generation, 3 studies (Hegde *et al.* 2013, Ribeiro *et al.* 2014, Basha *et al.* 2015) were judged as low risk of bias while it was judged as unclear for Chandna and Kedige 2015 study as it didn't mention type of randomization used. Allocation concealment was unclear for all included studies. Regarding Blinding of outcome assessment, 3 studies (Hegde *et al.* 2013, Basha *et al.* 2015, Chandna and Kedige 2015) were judged as unclear as there was no any mention about blinding of the assessor or statistician while it was low risk of bias for Ribeiro *et al.* 2014 study. All studies were considered overall as unclear risk of bias. Figure (2) represents risk of bias summary: review authors' judgements about each risk of bias item for each included RCT study while Figure (3) represents risk of bias graph: review authors' judgements about each risk of bias item presented as percentages across all included RCT studies.

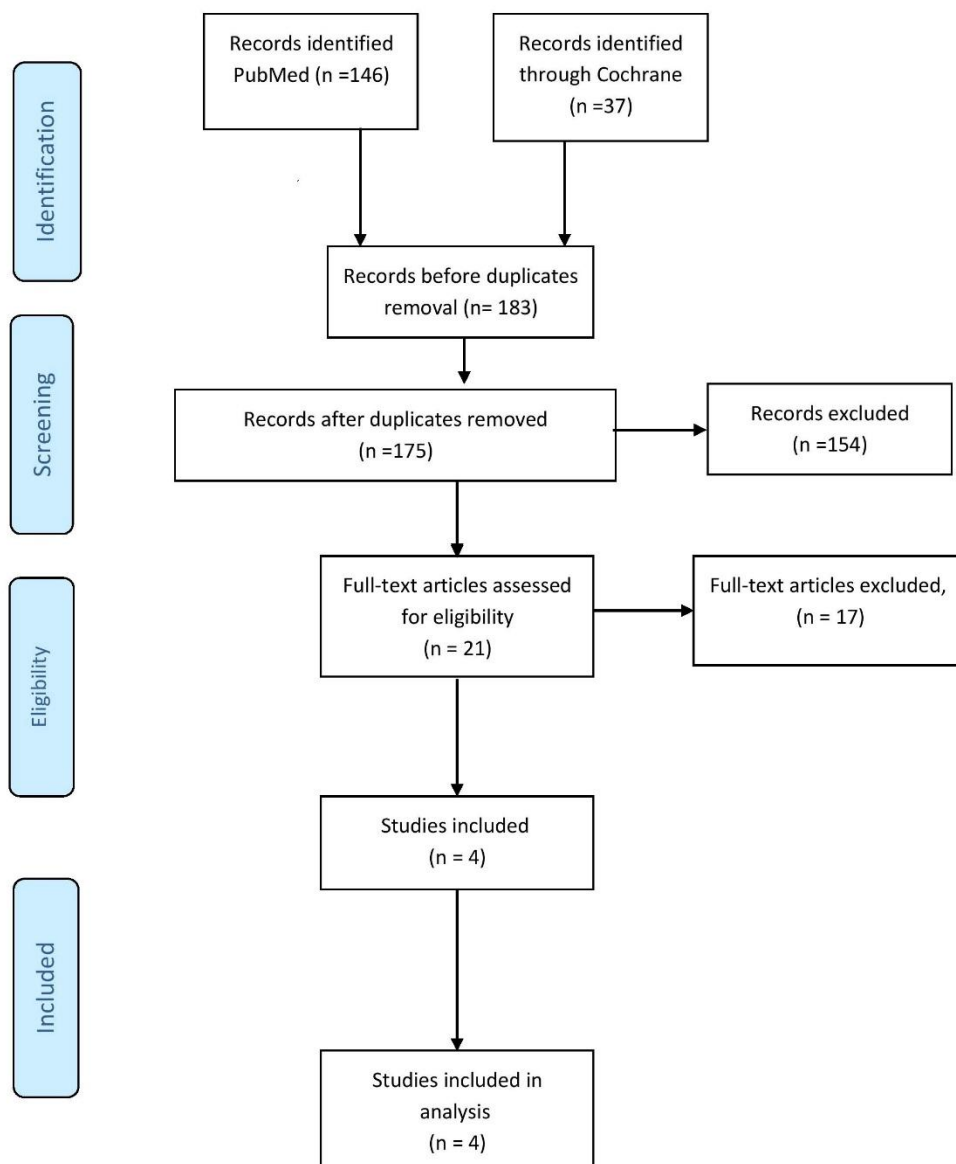

Figure 1:- Prisma flow chart for the study.

Figure 3:- Risk of bias graph: review authors' judgements about each risk of bias item presented as percentages across all included RCT studies.

Table 1:- Summary of findings table.

Authors and date	Population	Laser type <u>Vs</u> Control	Outcome
Basha et al 2015	20 patients with 40 bilateral maxillary sites	Nd: YAG laser <u>Vs</u> Scalpel surgery	Intergroup comparison for time taken, pain, and patient preference was statistically significant in favor of laser. Intragroup comparison for laser and surgical stripping at 6 months for Dummett Oral Pigmentation Index (DOPI), Hedin index, and size of pigmented area was statistically significant. Non-statistical difference in other results.
Hegde et al 2013	35 patients with 140 bilateral sites	CO2 and Er: YAG laser <u>Vs</u> Scalpel surgery	Thorough removal of pigments, pain reduction, and higher patient preference were associated with Er: YAG laser but more sites showed repigmentation. The CO2 laser was beneficial in terms of complete hemostasis intraoperatively and delaying the rate of repigmentation. Repigmentation was least after the surgical stripping procedure.
Ribeiro et al 2014	11 patients with bilateral anterior maxillary sites	Nd: YAG laser <u>Vs</u> Scalpel surgery	A statistically lesser chair time was observed in the laser group. A statistically lesser extent of discomfort/pain was in laser group during the first posttherapy week. Non-statistical difference in other results.
Chandna and Kedige 2015	20 patients (10 for each group)	<u>Diode laser</u> <u>Vs</u> Electro-surgery	A statistically highly significant difference in the pain levels between the two groups 24 h post-operatively in favor of laser group. Despite of lesser mean pain level for the laser group at other times, it was a non-significant difference.

Discussion:-

Lasers can be used as a contemporary alternative to the traditional scalpel in oral soft tissue surgeries because it offers simple manipulation as regards to absence of bleeding, reduced need for local anesthesia and increased patient comfort (Arnabat-Domínguez *et al.* 2010). From that points of view comes the research question, why not to recommend laser over conventional techniques.

Melanin is a word derived from the Greek one “melas” or black (Hegde *et al.* 2013). Melanin hyperpigmentation can affect all races and all ages with no gender predilection (Eisen 2000). Gingival hyperpigmentation is an esthetic problem for many patients, especially if visible when smiling. lasers have been suggested as an alternative to conventional procedures for providing a more patient centered outcome (Atsawasuwat *et al.* 2000). However, up to date, no evidence based recommendation for whether to go for the conventional strategy or replace it with the contemporary lasers.

The trials presented in this review agreed that both techniques are successfully used for the treatment of gingival hyperpigmentation but which one is recommended over the other, an issue that needs further discussion.

Blade surgery for gingival depigmentation is a definite precise and controlled procedure beside being the most economical procedure. Any depigmented areas are appreciated immediately and there is no chance for any residual pigments. On the other hands, this technique required the use of local anesthesia, associated with pain and hemorrhage and required care not to expose the bone or create gingival recession (Grover *et al.* 2014).

Also, periodontal dressing for at least a week is mandatory to guard against food debris, foreign irritants, thermal stimuli and infection (Gurumoorthy Kaarthikeyan *et al.* , Grover *et al.* 2014). The denuded tissues which heal by secondary intention after conventional surgery may promote bleeding after the procedure and is associated with some discomfort and pain for the patient (Ribeiro *et al.* 2014). The denuded connective tissue heals by secondary intention and is associated with pain and late repair (Roshna and Nandakumar 2005).

The expected complicated postoperative period, even if mild, may interfere with patient daily activities and well-being (**Ribeiro et al. 2014**). An experience that should be avoided by the modern patient centered care strategy.

Despite that surgical stripping has been the old gold standard for gingival depigmentation, lasers start to gain prominence in that field (**Coluzzi 2004**).

Using of lasers for oral soft tissues provides benefits not only to dental operators but also for the patients. Patient-centered outcomes are the main target for researches in the last decade (**Hujoel 2004, Ozcelik et al. 2007**).

Concerning the cosmetic outcomes, some aspects of using lasers may benefit the purpose as precise cutting and control and the application of delicate contact tips during the procedure which enhances trans-operative visualization (**Cobb 2006**).

One of the advantages of using laser is that patients felt no pain either during or after the treatment without requiring an additional anesthetic injection. Fear of pain during dental surgeries or even the needle used for anesthesia are among the causes of avoiding dental visits. Thanks to lasers that solve a part of that problem (**Matys and Dominiak 2016**).

The reduced pain in comparison with conventional surgery may be due to the protein coagulum formed on the surface of the wound that acts as a biologic dressing. Sealing of the ends of sensory nerves may be also considered which is not the case in surgical stripping where the nerve endings is left exposed (**Gurumoorthy Kaarthikeyan et al. , Hegde et al. 2013, Rathod and Mulay 2013, Basha et al. 2015**). A disrupted cell membrane $\text{Na}^+\text{-K}^+$ pump with the resulting loss of impulse conduction may be another cause of pain reduction associated with laser use (**Chandna and Kedige 2015**). The biologic dressing not only reduces pain but also protects the surgical area and provides a better postoperative repair with minimal damage to the tissue (**Ribeiro et al. 2014**).

Patients also appreciated the shorter operating time and minimal bleeding which is not the case in patients treated with the surgical scalpel technique (**Hegde et al. 2013, Grover et al. 2014**). The time taken for laser treatment was less than the surgical stripping may be attributed to better visibility due to less bleeding because of the coagulation of blood vessels (**Ko et al. 2010, Ribeiro et al. 2014, Basha et al. 2015**).

Several studies have compared different lasers with varying results, similar advantages includes a relatively bloodless surgical field, minimal swelling and scarring, reduction of surgical time and less postoperative pain (**Giannelli et al. 2014, Kishore et al. 2014, Soliman et al. 2014, Basha et al. 2015**).

It is the ablative property of laser that makes it possible to be used for gingival depigmentation by targeting the melanin in melanocytes in epithelium which absorbs and converts light energy into heat or what is known as photothermolysis (**Nakamura et al. 1999, Coluzzi 2004**).

A variety of laser systems can be used for gingival depigmentation, including carbon dioxide (CO_2) laser (**Nakamura et al. 1999**), diode laser (**Kaya et al. 2012**), Er:YAG laser (**Kaya et al. 2012**), and Nd:YAG laser (**Atsawasuwan et al. 2000**).

Neodymium–yttrium aluminum garnet (Nd:YAG) laser treatment has been considered as an alternative for gingival hyperpigmentation because of rapid healing and minimal bleeding during and after the procedures (**Ko et al. 2010**). Fortunately, Nd:YAG laser is selectively absorbed by hyperpigmented tissues (**Cobb 2006**).

It is the inherent ability of diode lasers to be absorbed within the chromophores that allows controlled cutting with a limited depth of necrosis or by other words a tissue-specific ablation. The other advantage of diode laser is that its energy is transmitted through water and fortunately it is poorly absorbed in hydroxyapatite (**Convissar 2004**).

Low-power setting (≤ 2.5) is recommended during the procedure to avoid discomfort and pain during the post-operative period and for faster healing time. The gated pulsed mode is also recommended to provide the necessary thermal relaxation (**Berk et al. 2005, Cercadillo-Ibarguren et al. 2010, Kaya et al. 2012, Romeo et al. 2012, Grover et al. 2014**).

Esthetic gingival depigmentation is considered successful if there is delayed, minimal, or no repigmentation (**Hegde et al. 2013**). According to **Bergamaschi et al.**, permanent results are non-achievable (**Bergamaschi et al. 1993**). Recurrence rate may differ not only with the used treatment modalities but also according to the duration of follow-up (**Ribeiro et al. 2014**).

Many studies reported recurrence after laser depigmentations (**Bergamaschi et al. 1993, Nakamura et al. 1999, Esen et al. 2004, Rosa et al. 2007, Kaur et al. 2010**) while others reported no repigmentation (**Atsawasuwana et al. 2000, Tal et al. 2003, Azzeh 2007**). Grover et al. reported that no statistical significance was seen in the comparison of conventional and laser techniques in terms of repigmentation (**Grover et al. 2014**).

It was noted that repigmentation appeared in the papillary areas and marginal gingiva which may be due to difficulty in treating these areas with lasers because of lying near tooth structure and the risk of thermal damage which recommends lower energy dose with inadequate depth of penetration of the laser beam, incomplete depigmentation, and faster recurrence (**Hegde et al. 2013**).

To avoid recurrence, the gingival tissue should be entirely cleared of melanin to avoid recurrence by melanocytes migration (**Sharon et al. 2000**). Also, patient race, environmental exposure and smoking may play a role in repigmentation (**Ünsal et al. 2001, Sridharan et al. 2011**).

Interestingly, another aspect that may affect repigmentation is the number of performed laser sessions. All the studies that used multiple sessions for laser ablation reported no recurrence (**Tal et al. 2003, Azzeh 2007, Kaya et al. 2012**).

Also, repigmentation was more common in the maxillary arch in comparison to the mandibular arch which may be due to more exposure to environmental factors during smiling and speech, factors that are not related to the technique used (**Hegde et al. 2013**).

Laser biomodulation may be a double-edged weapon as while accelerating healing, melanocytes from adjacent areas migrate faster, leading to faster repigmentation (**Hegde et al. 2013**).

Laser application requires that the operators are trained about safe and effective use of lasers (**Ribeiro et al. 2014**). The surgical stripping gives the benefits of tactile sensation beside no risk of thermal damage to the underlying structures (**Hegde et al. 2013**).

It is important to mention that care should be taken not to injure the gingival margin and interdental papilla during ablation of pigmented gingival tissue in these delicate areas. Also, higher doses can cause like delayed wound healing promoted by severe coagulation or pain caused by uncontrolled carbonization (**Ribeiro et al. 2014**).

Laser requires more advanced technology and armamentarium and it causes higher financial costs than more economical scalpel technique (**Ribeiro et al. 2014**). The patients' perceptions of costs and benefits balance interfere in the decision about choosing laser or scalpel surgical therapy.

The advantages of lasers over conventional surgical procedures are: bloodless field, reduced bacteremia and mechanical trauma, minimal post-operative swelling and scarring and minimal post-operative pain. On the other hand, loss of tactile sensation and expensive and sophisticated equipment that needs special training and precautions are considered disadvantages (**Chandna and Kedige 2015**).

Conclusion:-

The found clinical studies are not only too limited in number but also exhibit small sample sizes, besides being clinically heterogeneous so that a solid conclusion cannot be reached. Researchers should pay attention to this interesting field to work upon. Each kind of laser application should pull attention of researchers in oral and maxillofacial field to close obvious, yet important, research gaps of lack of enough randomized clinical trials that can be relied upon to get a standard evidence based clinical practice.

Within the limitations of this review, it can be concluded that lasers can be used as a safer and effective treatment modality to provide optimal esthetics and enhanced comfort with lesser pain to the patients during the treatment for

gingival hyperpigmentation. However, surgical stripping is a cost-effective procedure for achieving gingival depigmentation. Higher patient preference and pain reduction favor laser depigmentation, but more sites showed repigmentation. The lower cost of surgical stripping and the lower rate for repigmentation favor the old technique. Further studies with a larger study samples and a longer follow-up period would be desirable with special concern on multiple laser sessions to reach a solid evidence based conclusion regarding which technique is better keeping in mind the effect on repigmentation.
